Atthill, Dr., two successful cases of ovariotomy, 21; report of the Rotunda Hospitals, 102, 147
Aural affections, Dr. H. Macnaughton Jones on (Illustrated), 43, 294, 313

B

Baby doctors, 476
Bacteria, charbon and, 385
Bacteria, fermentation and, 395
Bank Holidays, our, 131
Barnardo, "Dr.," and his medical qualification, 413
Barometrical improvements, 38
Basic cerebro-spinal meningitis, "acute softening," 278
Bath and the British Medical Association, 366
Bathing fatalities, the prevention of, 203
Benevolent, a case for the, 78
Bequests to medical charities, 106
Berlin, infant morta ity in, 183
Bernard, Claude, the glycogenic function of the liver, 37
Bichromate of potash as an antiseptic, 223
Billroth, Dr. T., surgical pathology and therapeutics (Review), 161
"Black hives," 371

Births, 38, 165, 186, 226, 271, 312, 418, 440, 462, 484, 506, 529
Black, Dr. Campbell, Bright's disease (Review), 16
Blood-letting, revival of, 10, 49
Blood-letting in pneumonia, 112
Bloomsbury square School of Pharmacy, the, 238
Boddy, Mr. E. Marlett, matico in post-partum hæmorrhage, 170; overloaded state of the transverse colon, 376, 401, 421, 443
Bogus degrees in Germany, 478
Bradley, Mr. S. M., lectures on syphilis, for the use of students 23, 41, 79, 99, 128
Bread poison, singular source of, 388
Bridge, Dr. S. Franklyn, obituary note, 269
British Association, the, 13
British Medical Association, Bath and the, 366
British Medical Association, Dr. Stokes on the future of the, 151
British Medical Association, forty-fifth annual meeting, 106, 136
British Medical Association, the, 131
British Medical Association, medical reform and the, 153, 178
British Medical Association, the address in surgery, 152
British Pharmaceutical Conference, 53
Broadmoor criminal lunatic asylum, the, 432
Bromide of potassium, effects of, 308
Brompton Consumption Hospital, lectures at the, 373
Browne, Mr. Lennox, on tinnitus aurium, 127
Brunton, Dr. T. Lauder, tables of materia medica (Review), 118
Burdett, Mr. H. C., home hospitals, 148

C

Cacoethes scribendi, 503
Cæsarean operation successfully performed, 524
Calomel, caution in regard to, 544
Cameron, Dr. Charles A., the pathology of contagion and the question of spontaneous generation, 375
Camping out therapeutically considered 305
Captured English surgeons, the, 414
Cardinal Manning on drink, 73
Career of the English medical student, the, 232
Career of the Irish medical student, 241
Carmichael prize fund, the, 8
Carpenter, Dr., principles of mental physiology (Review), 172

A NEW METHOD FOR THE QUANTITATIVE DETERMINATION OF SUGAR IN BLOOD.

By F. W. Pavy, M.D., F.R.C.P., F.R.S.,
Physician and Lecturer on Physiology, Guy's Hospital, &c.

The following is a full abstract of the paper read before the Royal Society on June 14th, in which the author described minutely his new method for the quantitative determination of glucose, and its application to physiological relations of sugar in the animal system. The accurate results which Dr. Pavy has succeeded in obtaining by means of his new gravimetric process of analysis, and the importance of the subject itself, is such as will tend to advance materially our knowledge, and hence will substantiate and extend the position with regard to the treatment and pathology of diabetes.

The paper consisted chiefly of a description of the method which the author adopted for accurately ascertaining the amount of sugar in the blood of animals, and formed the prelude to one which was read on Thursday, the 21st ult., in which Dr. Pavy gave the results obtained by the application of his method as follows :—

1. The natural state of the blood.
2. The comparative state of arterial and venous blood.
3. The spontaneous change ensuing in blood after its removal from the system.

Before describing his own gravimetric system Dr. Pavy proceeded to criticise Bernard's new volumetric process, which has been described fully in recent issues of the *Comptes Rendus*. This method the author proved to be not only devoid of precision as a quantitative analytical process, but was in itself calculated to give rise to fallacious results, inasmuch as keeping the suboxide of copper dissolved by means of organic matter was fundamentally wrong. The entire system was based on errors, and the results were necessarily incorrect; two of these errors the author dealt with somewhat in detail. The first was in the assumption that the volume of trial liquid corresponds in c.c. with four-fifths of their weights in grammes of the mixture of sulphate of soda and blood. In practice it was found that the actual relation between the volume of liquid obtained and the weight of the mixture employed must vary in each individual case, according to the solid matter existing in the particular specimen of blood and the loss of liquid by evaporation during the separation of the coagulum by heat. The other error in Bernard's method arose from the influence which organic matter exerted in preventing the deposition of suboxide. The large addition of potash which is employed in this process—viz., from 20 to 25 cubic centimetres of a concentrated solution to one c.c. of the copper test, acts upon some one or other of the organic principles left in the liquid obtained from the blood, and prevents the deposition of suboxide of copper.

The author then proceeded to describe his own new gravimetric process, in which he adopts the use of a galvanic battery for effecting the deposition of copper which has been reduced by the sugar in a form to be susceptible of weighing. The details of this method are, shortly, as follows :—

A certain volume of blood—about 20 c.c. forms a convenient quantity—is taken for analysis, and first mixed with 40 grammes of sulphate of soda, the whole must be subjected to weighing in detail, so that the precise weight of the blood taken may be known. To this mixture, contained in a beaker of about 200 c.c. capacity, about 30 c.c. of hot concentrated solution of sulphate of soda are added, and the whole contents heated until a coagulum is formed.

Filtration is then performed, and the coagulum thoroughly washed, so that all traces of sugar may be removed. The liquid thus obtained, from having been run and squeezed through muslin, is slightly turbid, and must be boiled again and filtered through paper to render it perfectly clear. It is now ready for the application of the copper test. Being brought to a state of ebullition about 10 c.c. of the potassio tartrate of copper solution, or sufficient to secure that the test liquid is left in excess, are added, and brisk boiling continued for a minute, but not longer. In this way a reduction of the oxide to the

suboxide of copper is effected by the action of the sugar present in the solution.

The liquid is then filtered through a plug of asbestos, or, what is better, glass wool. The suboxide having been collected and washed from excess of the copper test liquid is next dissolved by a few drops of nitric acid, a small quantity of peroxide of hydrogen having been previously added in order to effect oxidation and consequent ready solution.

The copper present in the liquid is now deposited by the agency of galvanism. The positive pole of the battery is formed by a platinum spiral coil around which, and forming the negative pole, is a cylinder of platinum foil; upon this the copper is slowly deposited in a pure metallic form. This operation is continued until the appropriate test shows that the whole of the copper has been thrown down. The period ordinarily required to effect this does not exceed twenty-four hours.

The platinum cylinder is next removed, and instantly plunged first into distilled water and then into alcohol. After drying in a water over it is ready for weighing; the difference in the weight of the cylinder before and after the operation gives the amount of copper deposited.

The battery used is a modification of Fuller's Mercury Bichromate Battery, and has been selected on account of the constancy of its action.

From the amount of copper deposited, that of the sugar existing in the blood analysed may be accurately calculated. Five atoms of the cupric oxide of the test solution are reduced by one atom of glucose, it follows that 317 parts of copper represent the equivalent of one part of glucose, or the relation stands as one of copper to 0·5678 of glucose. Therefore, to ascertain the amount of sugar the weight of the copper has to be multiplied by 0·5678. This application of the copper test solution yields a gravimetric instead of a volumetric process of analysis, and one which has no uncertainty belonging to it. There is nothing for the mind to decide, and no opportunity for error of judgment, as may be the case to a slight extent where a gradual fading of colour—as in the volumetric process—has to be watched until the attainment of the proper point of the decolouration has been effected.

The accuracy and reliability of the foregoing process are strongly supported by the uniformity in the results obtained from a large number of experiments. Compared with the results yielded by this gravimetric process, those obtained by Bernard present the greatest discordancy. The figures he gives are invariably too high, and there is no intelligible relation in the differences noticeable, suggesting that there is something radically wrong in taking decolouration without precipitation of suboxide as a means of estimating the amount of sugar. Dr. Pavy supports this assertion by the conclusions derived from a large number of experiments.

OBSERVATIONS ON SOME POINTS IN THE PATHOLOGY OF SYPHILIS.

By James R. Lane, F.R.C.S.,

Surgeon to St. Mary's Hospital, Consulting Surgeon to the London Lock Hospital.

ON REINFECTION WITH SYPHILIS.

An important point in the pathology of syphilis, about which there is some difference of opinion, is the question whether the disease can repeat itself in the same individual, that is to say, can a man have an indurated sore and secondary syphilis more than once in his life? Ricord was the first to deny this recurrence, and he did so in very positive terms. At a later period, however, he admitted its possibility, and he likened it to the occasional recurrence of small-pox or scarlatina, but said that in all his long experience he had never seen an instance of it. Now, there can be no doubt that a patient does not contract a second indurated sore so long as he is under the influence of the syphilitic diathesis, unless, perhaps, after he has passed into the tertiary stage. If he is exposed to fresh contagion the result is either negative altogether, or a soft suppurating sore is produced, just as has been so fully proved to be the case when an indurated sore is artificially inoculated on a syphilitic patient.

It is a very important practical question whether this immunity is permanent, and will last the patient his life, for upon its decision depends the question whether syphilis is curable by treatment, or may wear itself out by lapse of time; or whether it is a life-long disease, as many good authorities believe. One distinguished speaker in the debate at the Pathological Society in 1876 on Mr. Jonathan Hutchinson's paper, expressed his opinion that "syphilis continues to be a constitutional disease throughout the whole life of the man who has it. Syphilis once, syphilis ever; syphilis general, syphilis universal, in the man all the time he lives."

I cannot acquiesce in this doctrine. It probably owes its origin to the impression naturally made on the minds of many practitioners by cases of obstinately persistent syphilis, unhappily only too common, in which, spite of all treatment, the disease seems to follow an independent course from one year's end to another; or in which, in the case of married persons, a long series of abortions or of diseased children is the result. But does not everyone whose experience is long enough know of patients who had syphilis in their youth, who recovered in due course from all its symptoms, who had no relapse, and who afterwards married and had perfectly healthy children? I myself, looking back over thirty years, can call to mind numbers, not of patients only, but of friends and acquaintances, of whom this has been the history. I therefore strongly deprecate the hopeless view of the case which is conveyed by the expression "Syphilis once, syphilis ever."

The best proof that the syphilitic diathesis can wear itself out is the fact, if it can be demonstrated, that the disease may be contracted a second time by the same person. I have seen what I believe to be unmistakable examples of this, and I fancy most of those who have been long in practice must have seen the same. There are not many instances of a second contagion of true syphilis specially recorded, probably because till recently nobody doubted the fact, and many who now meet with such cases do not appreciate their significance or think it worth while to publish them. Probably, also, they are not very common; for, after a patient has thoroughly got over his first attack, he either marries, or he is very careful about exposing himself to risks of contagion; he is an older and a wiser, if not necessarily a better man.

The Report of the Medical Committee appointed by the Admiralty in 1865, to consider the whole question of venereal diseases with a view to their prevention, states as follows:—

"Of thirty-three witnesses who were asked for their experience whether one attack of true syphilis gives immunity to the individual from a repetition of the disease, twenty-three not only declared it to be their opinion that such was not the case, but several amongst them stated that they had positively seen repeated attacks in the same person, which certainly were not relapses; whilst ten considered that an individual could be the subject of true syphilis only once."

The most recent authority on this point is my late lamented colleague, Mr. Gascoyen. A paper by him was published in the "Medical-Chirurgical Transactions" for 1875, in which he records eleven cases of re-infection which had come under his own observation. In addition to his own cases he gives in a tabular form sixty others collected from various publications, British and foreign. In thirty-five, constitutional symptoms followed the second contagion; in twenty, indurated chancre alone was the result; in five, an indurated chancre occurred while the patient was still suffering from tertiary disease. The fact last mentioned is of interest as corroborating Mr. Hutchinson's statement that syphilis is only a blood disease in the secondary period; and also of Ricord's doc-

trine that in the tertiary period the virulent principle has undergone a complete transformation.

To my mind there is ample proof that a second infection of syphilis may take place; and the corollary from this is that the disease may be cured or become extinguished, a result which I fully believe does take place in a very large proportion of cases.

CONTAGION OF SECONDARY SYPHILIS.

Another point of great importance is the contagious quality of the secretions of secondary syphilitic lesions, in the elucidation of which point great advances have been made of late years. In former times, and, indeed, soon after the great outbreak of syphilis at the end of the fifteenth century, the disease was supposed to be communicable not only by contact with its secretions in all its stages, but even by the breath of those infected, and very stringent measures were taken for the isolation of the sufferers to prevent its spread. Hunter denied the possibility of this mode of contagion, being lead to do so through his having failed to inoculate secondary syphilitic secretions on the patients themselves. In his chapter on "Diseases resembling the Lues Venerea," he describes cases which obviously illustrate the transference of secondary disease frem nurse to child, and from child to nurse, but he believed them not to be syphilitic, partly from their history, but mainly because they got well without mercury. At that time, and for long afterwards, mercury was held by many to be the crucial test of syphilis. If it did not cure the disease, the case was not syphilitic; if the disease got well without mercury, it could not have been syphilis. Benjamin Bell did not agree with Hunter's view as to the non-contagious nature of secondary disease, and Mr. G. Babington, surgeon to the London Lock Hospital, who commentated on Hunter's treatise on "Venereal Disease" in Palmer's edition of his works, also disputed its accuracy. The non-contagious theory was, however, strenuously upheld by Ricord, because he failed to inoculate from secondary lesions on the patients themselves, and it became an article of belief in the profession till about twenty or twenty-five years ago.

But some time before that the fact of the contagious nature of secondary syphilis had been clearly demonstrated by Dr. Wallace, of Dublin. In some admirable lectures published in the *Lancet* in 1835, he records five cases in which he inoculated healthy persons successfully from secondary lesions. All five developed indurated sores after a period of incubation, and all had secondary disease. The scientific value of these experiments was very great, although the mode in which it was obtained was no doubt unjustifiable. Dr. Wallace clearly deserves the credit of first re-establishing the fact of the contagion of secondary syphilis, but he must also bear the discredit of having been the first to communicate syphilis wilfully, and for experimental purposes to healthy persons, they being left in ignorance of the nature of the proceeding. I am not aware that this attracted any hostile notice at the time; but what, I wonder, would happen now if any one of us were rash enough to do the like? It is not long since that a jury awarded heavy damages against an unhappy surgeon who, having contracted a venereal sore on his finger in the practice of his profession, and being unaware of its real nature, had the misfortune to communicate the infection to one of his patients during childbirth. I presume that anyone who now inoculated a healthy person with syphilis as an experiment, without first fully explaining the probable result, would run the risk of a prosecution for wounding with intent to inflict grievous bodily harm, and imprisonment or even penal servitude might be his portion.

I believe the practice has not been repeated in this country since Dr. Wallace's time. Ricord always very properly denounced it, but other Continental practitioners have been less scrupulous, and, at the cost of a number of unhappy victims, a series of valuable facts has been obtained, which confirm those given by Dr. Wallace, and place the question beyond all doubt. It would occupy too much space to refer to these in detail; it is sufficient to say that the result, when successful, has uniformly been an induration at the inoculated point after a period of incubation, and secondary affections in due course.

The clinical evidence of the communicability of secondary syphilis is abundant. Mucous patches on the vulva or on the os uteri are probably among the most frequent causes of infection, and similarly in the opposite direction as regards the sexes, but less frequently, the same kind of patches on the glans penis, prepuce, or scrotum. Instances of the infection of healthy children by diseased wet-nurses, and of healthy nurses by suckling diseased children, are familiar to all. In these the contagion, unless under very exceptional circumstances, must have been derived from a secondary source—mucous patches on the mouth of the child or on the nipple of the nurse. Too familiar again are the cases—I have seen numbers of them—of members of our own profession who have contracted disease in ministering to syphilitic patients, especially in midwifery practice. In these latter the poison must have been nearly always from secondary lesions, for the primary affection has usually passed away before the period of parturition.

There are many other less obvious ways which show with what facility and in what circuitous modes this noxious contagion may be disseminated. A drinking vessel, a spoon, or a tobacco-pipe passed from one person to another have all been known to act as vehicles. Men engaged in blowing globes of glass, and who are in the habit of passing the blow-pipe from one to another, have thus been infected, and this so frequently that at some of the glass-works in France it has been found necessary that each man should have a special mouthpiece of his own to receive the blow-pipe. In the Jewish rite of circumsion, in which it is the custom for the operator to take some astringent fluid into his mouth and to suck the wound to arrest bleeding, the contagion has been known to be transmitted to the child. Eustachian catheters, which have been used on patients with secondary patches in the throat, and which have not been properly cleansed, have been known to convey the disease. I have seen one well-marked example of this. I believe also the use of public waterclosets at railway stations or hotels may be a not very unfrequent cause. I know this latter possibility is alleged so often by patients as an excuse that it has come to be received almost with derision, but I see nothing improbable in, we will say, a female with mucous patches on the vulva, or a male with a similar condition of the penis or scrotum, depositing some poisonous secretion, by which the next comer may be contaminated. At all events the knowledge we now possess of the many unexpected and unlikely ways in which syphilis may be conveyed, ought to make us extremely cautious in looking upon the existence of the disease as in itself evidence of immoral conduct. This is a point which, I think, cannot be too strongly insisted upon, and a proper appreciation of it will enable us often to dissipate unfounded suspicions, and to save reputations which, under the old belief, would have been perhaps irreparably damaged. It is better to allow ourselves to be deceived a hundred times by false excuses, than to countenance one unjust imputation.

CONTAGION BY SYPHILITIC BLOOD.

The contagious quality of the blood of syphilitic persons must also now be considered an established fact. In 1850 Dr. Waller, of Prague, inoculated a healthy boy, aged sixteen, with the blood of a woman with secondary syphilis. Five weeks afterwards indurated tubercles appeared at the inoculated points, and a secondary eruption followed. Lancereaux has collected twenty-three cases in which the inoculation of healthy persons with syphilitic blood has been practised. In six the result was the same as that just related—*viz.*, the formation of indurated tubercles locally after an interval of incubation, and subsequent secondary disease. In the remain-

ing seventeen cases the result was negative. The failures, however, cannot invalidate the positive results obtained in the other six cases, which seem to demonstrate beyond doubt that the contagion is present in, and is communicable by, the blood of a person with secondary syphilis. "The life of all his blood is touched corruptibly," although, perhaps, the poison may not exist there in so concentrated a form as in the secondary secretions, as the proportion of failures to inoculate successfully seems to indicate.

Hunter has recorded several cases of disease following the transplantation of teeth, a practice which was common in his time. The transplanted teeth at first became firmly fixed, but at the end of about a month the gums ulcerated, the teeth dropped out, and secondary symptoms followed. Hunter did not look upon these cases as really syphilitic; he describes them while speaking of "diseases resembling lues venerea." Mr. Lee regards them as examples of contagion by diseased blood, but the diseased tissue of the transplanted tooth is, perhaps, even more likely to have been the cause than the blood.

MENIERE'S VERTIGO—TREATMENT BY SULPHATE OF QUININE.

Translated from *Le Progrès Médical*, by Francis M. Luther, M.D., Cappoquin.

Gentlemen (says M. Charcot) I thought it would be interesting to inaugurate this year's conferences by showing you at the Salpétrière—that is to say, in an establishment devoted for the most part to chronic cases supposed to be incurable—two examples of cures, or at least of improvements equivalent to a cure. The term incurable, of course, when applied to a disease, should not be taken in an absolute sense, for while it applies to totally irremediable cases, it also applies to others for which remedies may be found, though they have not yet been discovered.

The cases about to be presented to you form two very distinct groups; in one the cure or the amendment has been produced spontaneously, without the intervention of science; in the other it has been wished for, sought after, anticipated. I will particularise one case belonging to the latter group.

The patient is one whom I showed you, for the first time, two years ago, and again last year. I will not enter into long details concerning the clinical history of the case; you can read the particulars of it in the *Progrès Médical*, which reported it. It has been, reproduced, moreover in most of the French and foreign medical journals. I will confine myself to glancing at the most salient traits of her history, mainly in order to enable you to appreciate exactly what was the state of things before therapeutic intervention.

It is, in my opinion, a very fine example of Meniére's disease, or rather Méniére's vertigo, for the syndroma, or group of symptoms to which these denominations refer, does not answer exclusively to one morbid state alone; it may be seen associated with very different affections of the ear.

The patient's situation at this period, that is to say, in May last, was absolutely the same as in 1874—that is to say that G. was for several years literally confined to bed by a permanent state of vertigo, and rendered by it nearly incapable of executing almost any movements. The slightest movements communicated to the bed also very considerably aggravated the vertiginous sensation, and many among you have doubtless not forgotten the profound anxiety painted on the patient's countenance, and the piercing cries she uttered when we had to have her carried last year and the year before upon a litter into the hall of conference.

Besides this vertiginous state, which is in some sort habitual, and is accompanied by noise in the ears, G. was subject, from time to time, to great vertiginous crises. I dwelled much, at the time, upon the description of these crises, because I believe they constitute the symptomatic fundamental fact in Méniére's disease, whilst the habitual vertiginous state may be in some sort considered as a complication, an epiphenomenon, noticeable only in exceptional cases.

The paroxysms I allude to are always announced and immediately preceded by the sensation of a shrill, piercing sound, which supervenes suddenly, unexpectedly, and which, in G.'s case in particular, as, moreover, in many other patients of the same class, resembles, even so far as to be mistaken for it, a railway whistle. I have been led to consider this shrill whistling as one of the constant necessary elements, and consequently a characteristic of *vertigo ab aure laisâ*. Quite recently Dr. Lussana, in a series of interesting articles, which have been published in the *Gazetta Medica Italiana Lombardia* (1875, vol. xxxv., seventh series, t. ii., No. 43, October) has confirmed this point, which is interesting both to clinical and pathological physiology.

As to the vertigo itself, in G.'s case it conforms to the classic type—a sensation succeeding to the whistle of a brusque movement of translation, in consequence of which the patient believes herself flung as by some external force either backwards or forwards. Impulsions in a lateral direction are much more rare; there is an absence of loss of consciousness; nausea and sometimes vomiting supervene towards the end of the attack.

I may remind you by the way, that this sort of motor-hallucination is not always (pardon the expression) platonic. I have enumerated for you several cases in which the patient, actually carried away by the vertigo, has fallen heavily on the face. One patient fractured the bones of the nose; another, of whom I shall speak to you presently, broke several teeth.

I shall finish by remarking that in G.'s case the malady is of very ancient date, the first symptoms counting back more than ten years; that there exists on the left side a lesion of the drum of the ear, with thickening of the membrane of the tympanum and frequent discharge of pus mingled with blood.

Now, while you have actually present before your mind the former tableau of symptoms, I am going to enter into some details, to show you under what circumstances the amendment has been produced which enables G. to-day to hold herself upright, as you see her, and to walk without assistance; to spend the whole day sitting quietly upon a sofa; and lastly, to undergo, without displaying too much emotion, all the shocks and all the disturbance inflicted on her by our curiosity.

In my lecture upon Ménière's vertigo, delivered in 1874, I promulgated some therapeutic considerations. I stated, amongst other things, that *vertigo from aural disease*, even when most inveterate, got well sometimes spontaneously when the patient became completely and irreparably deaf, and ceased to hear the whistling. I asked myself also, if it would not be possible to bring about this desirable result by surgical intervention. I recommended also the dotted cautery over the mastoid process. The method I have adopted in the case before you is both much more simple and much less heroic.

The idea occurred to me that, by the aid of sulphate of quinine, which everyone knows produces noise and buzzing in the ears more or less pronounced, one might succeed, perhaps—by prolonging sufficiently the employment of very large doses—in producing durable modifications in the function of the auditory nerve. The result, you will see, has justified my conclusions.

Giraud —— has taken the sulphate of quinine in the dose of ten to fifteen grains daily, steadily, except for a few interruptions of some days, necessitated by gastralgic attacks, during the whole of the month of May and of the month of June and the first twenty days of July.

Towards the beginning of June—that is to say, about five weeks after the treatment had commenced—it was remarked that for several days past the patient might be stirred in her bed, and even moved from one bed to

another, without uttering cries of distress, as she used to do regularly on such occasions.

Being interrogated, she informed us that the shrill whistle had about the same period at first diminished in intensity, then completely ceased, and in the same degree the great vertiginous crises. The permanent buzzing sound had been replaced by one of quite a different character, and which appeared referable to the action of the sulphate of quinine. Encouraged by these first results, I urged G—— to rise, and to try to hold herself upright and to walk. She at first refused energetically, dreading a return of the vertigo, and considering moreover the attempt to be impracticable, not to say more. I insisted: finally she consented, and one fine day, supported by two aids, she succeeded in achieving, not without great effort, two or three steps, rendered very difficult, apparently, by an excessive sensibility of the sole of the feet rather than the vertiginous state. I required the experiment to be repeated every day. The improvement was rapid, for about the 20th of July, at which date the exhibition of the sulphate of quinine was stopped, G—— had already been able several times, with a sufficiently assured gait and without any other assistance than that of a cane, to make the rounds of this vast hospital. The malady since this period has not made any aggressive return, and you can judge for yourselves that the attitude of the body and the gait are not very different in her from what they would be in a person in good health. I will add that she is neither more nor less deaf than before. It is not then, you see, by inducing complete paralysis of the auditory nerve that the sulphate of quinine acted in this case.

The fact to which I have just called your attention is not unique of its kind. I could quote several others in which the happy influence of the sulphate of quinine has been proved. I will confine myself to mentioning one of them in particular, interesting because the result obtained was witnessed by several *confrères*.

I was called in June, 1875, to consult upon the case of a lady, aged thirty, who for eighteen months past had become subject, I was told, to epileptiform paroxysms, or at least hysteric epilepsy. Bromide of potassium had completely failed.

From the consultation it appeared perfectly clear that neither syphilis, nor hysteria, nor any traumatic cause whatever figured in the patient's antecedents. The lady, who was very intelligent moreover, was kind enough, at my request, to enter into the most minute details concerning the character of the attack. I learned from her that during it she was doubtless very much troubled and agitated, but had never lost consciousness. However, its access was sudden, unforeseen. The sensation of a fall forward came on all at once, and in fact the patient had been actually precipitated forward several times. Once, indeed, the fall broke two of her teeth. The symptoms then were a vertigo of translation of sudden onset, a fall forward without loss of consciousness, consequently then some of the most pathognomonic characteristics of Ménière's vertigo. In order to complete the resemblance, I will add that in Madame X.'s case the attack often terminated by nausea or even vomiting.

This first information once obtained, I made a brief survey of her auditory capacity by the aid of a watch, and I perceived that her hearing was very manifestly weaker on the left side. I then put a final question. The answer should be, in my mind, decisive. I asked if she did not sometimes fancy she heard a shrill sound more or less analogous to a whistle, Her husband, who was present at the consultation, here took up the conversation, and replied energetically that in fact Madame X. was often astonished at hearing the whistle of the railway locomotive adjoining at unaccustomed hours, and when in reality nothing of the kind had occurred. The connection between the brusque onset of the whistling sound and the invasion of the vertiginous attacks was after that easily established.

I believed I might pronounce in this case that it was neither epilepsy nor hysterical epilepsy, but truly Ménière's vertigo. I gave some hope that by the aid of treatment the attacks might be diminished, perhaps suppressed altogether. Sulphate of quinine was prescribed in ten-grain doses for two months. Soon after the treatment was begun the whistlings and vertigo ceased, and have not since returned.

REMOVAL OF LARGE TUMOUR.

By A. Kidd, M.R.I.A., L.K.Q.C.P.I., &c.,
Ballymena.

Miss G., æt. about 35, consulted me three months ago about a tumour that she was anxious to have removed. The girl resides in the neighbourhood of Ballymena, and her family is that of the respectable farming class. I understand her general health has always been very good till, a few months previous to my seeing her, she had an attack of fever, in which she was attended by another medical gentleman. She is rather stout and muscular, with a temperament of the phlegmatic character.

The history that she gave me of her case is that, about twelve years ago, she was lifting or giving some assistance to her mother, when she hurt or in some way injured her left side. Soon after, she noticed a small lump forming at the site of the place complained of. From the time of supposed hurt, and during the whole twelve years, the tumour had been gradually getting larger; but since her recovery from the fever already referred to, she says it had increased in size rapidly.

On examination, I found a tumour on the left side of the abdomen, occupying the space between the two last or floating ribs (these a portion of the base covered) to the crest of the ilium. Its form and size might be well represented by that of an ordinary tea-cosey, probably being a little broader at its base than that article. I considered the growth to be lipoma, and after its removal the diagnosis was found correct.

Having got the assistance of Dr. Murney, of Belfast, and Drs. Young and Gilmer, of Ballymena, I proceeded to the operation for its removal on Thursday, the 24th of May last. The patient having been put under chloroform, two elliptical incisions were made, one on either side of the tumour, joining at each end. The skin between was left adherent. These incisions were each seventeen inches in length. Flaps were formed, and not much difficulty was experienced in dissecting out the tumour, no deep attachments having been found present. During the operation it was ascertained that the tumour consisted of two distinct lobes of about equal size and shape, closely applied to each other, without any space between them. Not much blood was lost, though the operation was (from the nature of it) unavoidably a little tedious. The weight of the tumour after its removal was ascertained to be 7¾ lbs.

About a dozen sutures were inserted, and the wound dressed with carbolic acid. Owing to the chloroform, the patient did not suffer any pain during the operation, which she bore well and was not timid about. Union by the first intention took place in nearly the whole of the wound, and the patient made an excellent recovery.

The chief points of interest in this case are—the great size of the growth, the large wound that was required for its removal, and its healing so quickly and favourably without a single bad symptom.

It appears from the Irish Lunacy Reports, with reference to previous professions among the insane, that the military is in a larger proportion in private asylums than any other, being twenty-four of the line against any one navy officer, twenty-one clergymen, sixteen lawyers, and ten physicians.

Clinical Records.

WEST LONDON HOSPITAL.

A Case of Traumatic Stricture of the Urethra, necessitating the frequent daily use of a Bougie.—Internal Urethrotomy.—Cure.

Under the care of Mr. TEEVAN.

STEPHEN K., a sailor, æt. 41, was admitted into the hospital on April 16th, 1877.

History.—Two years ago, whilst on board a yacht, the man fell a distance of ten feet astride the combings of a hatchway. A good deal of blood escaped from the penis immediately after the accident, and a surgeon tried to pass a catheter, but could not. Leeches were applied to the perinæum, and he was able shortly afterwards to urinate. Five weeks later he went to the hospital at Exeter, where, he said, he was treated by gradual dilatation, and when he left No. 11 could be passed. The relief was, however, but temporary, and he was obliged several times every day to introduce a No. 7 bougie into the stricture before he could make water.

State on admission.—The patient, although apparently healthy, looks careworn and dejected. He is obliged, three or four times every day, to introduce a bougie into the stricture in order to make water, and it takes the patient some time to be able to pass the instrument. The stricture, which is tough, irregular, and very sensitive, commences three inches and three-quarters from the meatus externus. Mr. Cumming, the house-surgeon, examined the urine, and found it to be alkaline, loaded with mucus, and its specific gravity 1020.

Treatment.—For a period of three weeks he was kept quiet in bed, and subjected to continuous and gradual dilatation. The result was that the strictured urethra could not be enlarged beyond No. 17 (Charrière), and even that calibre could not be maintained for many days. He did not bear the treatment well, and had nausea, pain over hypogastric region, general constitutional disturbance, and, on one occasion, a rigor. Under these circumstances, Mr. Teevan determined to perform internal urethrotomy. Accordingly, on May 8th, at 3 p.m., Mr. Teevan divided the stricture from before backwards, and having passed a No. 25 bougie to show that the urethra was restored to its normal calibre, he immediately withdrew it. The patient would not take ether, and did not complain of pain. About one tablespoonful of blood was passed.

May 9th.—Mr. Cumming found the patient had had a bad night, his tongue was out, and he complained of headache. The urine was passed in a large stream, attended by much smarting. Pulse 108; temp. 100°.

10th.—Had a good night. Temp. 99·3. Has but little pain when micturating.

11th.—No. 18 passed.

14th.—No. 20 introduced.

16th.—Patient is up and about to-day. No. 23 "bougie olivaire à ventro" passed.

21st.—No. 25 ditto.

23rd.—Patient introduced No. 25 for himself.

On June 14th patient left the hospital, quite well in all respects. The urine was acid and free from mucus. He took with him a No. 23 catheter, with directions to pass it at stated intervals. Since the operation he had not once required to introduce an instrument to enable him to urinate.

Remarks by Mr. Teevan.—The patient had the misfortune to suffer from a stricture of the worst description, for, being traumatic, it was necessarily a troublesome one to treat, and nothing less than its complete division afforded the patient any chance of being rid of the annoyance of the daily-recurring attacks of retention. The fact that the introduction of a bougie sufficed to relieve the stoppage, showed that the bladder was not at fault. The operation was perfectly successful, and after its performance the patient had not once to resort to the bougie for relief. The after-treatment of the case was of the simplest description, everything being left to Nature, care only being taken to ensure the insertion of a good "cicatricial splice" by the introduction of a large bougie every third day. As the patient had come all the way from Devonshire, he was kept under observation for some time, to see whether the results achieved were permanent or not.

THE CRIMINAL RESPONSIBILITY OF THE INSANE.

IN mental alienation, there is great uncertainty connected with the question of responsibility, and about fifteen years ago it was made the subject of a long and solemn discussion by the Medico-Psychological Association—the theme being "Partial responsibility. How to define it? In what circle to limit it? Ought it even to be admitted?"

Opinions were and remain divided; the society did not succeed in placing it on the basis of a common jurisprudence. Some believed in limits in which the society might legitimately take notice of the acts of the alienated, whilst others, although partisans in theory of absolute irresponsibility, would concede in exceptional cases, for certain individuals, an abatement of sentence. A larger number were in favour of much further extending the field of free will; and in virtue of the solidarity of the faculties, adhered to the non-criminality theory, being guided in practice, less by debateable doctrines, than by particular circumstances.

One or two speakers rejected arbitrarily extenuating circumstances altogether, giving neither hysterical nor epileptic patients the benefit of a doubt, whilst drunkenness added to the gravity of the offence.

Struck by these conflicting opinions, and the uncertainty which exists in forming sometimes even an approximately correct view in criminal cases, Professor Delasiauve set himself the task of defining the terms of the problem which, as far back as 1853 and 1859, had been presented, in two papers, read and discussed before the Medico-Psychological Society. (*a*)

FREE WILL—inscrutable mystery to our limited perception—is affirmed and denied.

It is essential to establish principles capable by their clearness of leading to a rule acceptable by all.

Perhaps my efforts in this respect have not been altogether fruitless. It is clear enough that crimination yields before madness. But with the exception of flagrant troubles, are there not distinctions to make? In partial delirium there is the healthy side and the morbid side. Ought we, applying here the assumed law of solidarity, pass over innocently offences foreign to the affection? or inversely, the offences having emanated from the influence of delirium, ought we to graduate the penalty in proportion to the degree of intelligence?

Logic appears to me equally to condemn both systems. To attach responsibility of some kind to an unfortunate, whose reprehensible act has directly sprung from mental perversion, is repugnant to our reason; in the opposite case I believe we exceed the limits in proclaiming an absolute irresponsibility.

I am of opinion that the patient escapes responsibility when the madness is manifest, or when, being limited, it is the cause of the reprehensible act.

When incrimination rests, on the contrary, on facts, the mainspring of which is foreign to insanity, it then belongs to experts and judges to inquire in their prudence—taking count of antecedent or actual circumstances—the degree of influence which diseased sentiment may exercise on the action of free will. We specialists are accused of confounding the passions with madness. The objection falls to the ground before the formal separation of the two domains, not that in leaving to the magistracy the appreciation of natural instigations we free ourselves. Only his *rôle* commences when ours end. Enlightened by us on the degree of the psycho-cerebral state, on it devolves the task of deciding in the sphere of normal manifestations, the knowledge of which is not the monopoly of any person, and which it possesses like all the world.

The examination of facts, from which resulted my works on pseudo-monomania, has fully justified the well-founded

(*a*) *Le Progrès Médical*, June, 1877,

nature of my distinctions. Cases of this kind are the ones which generally present a litigious character. Erratic, intermittent, as the nervous fluctuations which produce them, the fascinations with which the sufferers are beset are so little incompatible with the normal exercise of their faculties, that most of them live in the world, fulfil their obligations, without their torment being even suspected by their neighbours. With the consciousness of their sinister reveries they are humiliated, they are terrified by them, and resist them as far as possible, unfortunately, not always victoriously.

We can imagine that an assassination, a fire accomplished in such a condition, would excuse responsibility, whilst we could not say as much of other offences or crimes suggested by habit or natural propensity.

Is it not a common occurrence to see figuring amongst those accused of offences and crimes, individuals suffering from convulsive nervous affections, especially epilepsy?

We know the perversity and the violence of a great number. If judgment overtakes them, generally the medical experts are in their favour.

In vain we have wished to distinguish epileptics, as insane and simple. The attacks produce in all troubles which persist after the crisis, and which lowering the *morale*, may conduce to wicked actions. How, then, either to recognise or clear up their participation? The uncertainty and chances of error are sometimes great—the distance between the attacks is not always a guarantee. The *morale* also rebels, when the appearance of reason exists. I have noticed (*Journ. of Ment. Med.* v. i, page 265) an offender, who for weeks preserved a concentrated irritability, in every way contrasting with the placidity of his normal state. For the theft of a note for 1,000 frs., accomplished in an eccentric condition, this unfortunate was condemned to eight years' seclusion. In spite of my certificate, the jury returned a verdict of culpability, only with extenuating circumstances. The penalty was reduced to eight months' imprisonment; too much or too little.

These remarks are opportunely illustrated by a case, which has recently occurred in the department of the Seine, the details of which will be read with interest in this country.

Martial Leveque, aged 41 years, mason, dwelt at Champeaux, near Montmorency. Accused of assassination, committed on July 3, 1876, he was brought up for the first time on the 21st November, 1876, before the Court of Assize, but important witnesses being absent, the case was remanded, and was only taken on January 3rd last. What took place?

Charcou, the sapper of the fort about forty metres on the route from Domont to Montmorency, found Leveque laid in a trench on military ground, and asked him to retire. "If you were alone," says Leveque, "I would rip you open." Charcou, nevertheless, seized him, and dragged him away. He resisted and took up a stone to strike the soldier.

Some passers-by interfered; amongst others, a carman, Cebel, against whom the accused turned his anger. Being too weak, Cebel would have succumbed, without the aid of a comrade, Maucourant. As he retired, Leveque followed him, and plunged a knife into his breast; death was instantaneous; as an excuse the murderer alleged epilepsy.

The affection is real, but Dr. Bidart, of Pontoise, estimating from the state of his memory, that he was not under the influence of nervous aggression, gave his opinion in favour of a modified responsibility. Such is not the opinion of Dr. Font Réaux.

For some time Leveque showed frequent signs of madness; he had already sojourned for several weeks at the asylum at Bicêtre, and he consequently judged him irresponsible.

Embarrassed by this contradictory advice, the President of the Court appealed to a distinguished specialist, Dr. Motet, who, approving of the views of Dr. Bidart, supported his opinion. The jury, accepting their decision, condemned the murderer to only five years seclusion.

From the simple newspaper report, it would be difficult to pronounce an authoritative opinion, and I have had recourse to my excellent colleague, M. Motet, who has obligingly communicated to me the particulars of his observations.

The culprit, a passionate and brutal man, was accustomed to similar acts of violence Twice already he had been condemned for violence to his wife and brother-in-law. One day at Paris, seized with instantaneous fury, he broke everything at the house of a relation who received him; arrested, he passed from the depôt to Saint Ann's, then to Bicêtre, where he remained from November, till August 1872.

In January, 1873, taken up as a vagabond, he is promptly set at liberty, on a certificate from M. Laségue, framed in these terms:—

"Epileptic with rare attacks; alcoholism slight.

"Leveque is in the period of remission sufficiently clear, so that the sending of him to an asylum, would not be justified by his actual condition."

The report of M. Motet states, that the robust state of his health, spite of the long existence of epilepsy, had not been altered. The great convulsive manifestations were rare; an attack, of which M. Motet was a witness, confirmed the vertiginous form indicated by M. Laségue.

The learned expert, without believing in the actual influence of epilepsy, has not, however, neglected it, and I give you a *resumé* of his conclusions in this case:—

1. It is not proved that his epileptic condition contributed to the perpetration of the crime.

2. Its author must be considered as being responsible for it.

3. As to the degree of responsibility, epilepsy being established, we may take into consideration the inferior *morale* created by this malady, and the perversions of character, which are the consequence of it.

It is certain, to confine myself to the thesis of M. Motet, that the tragedy of Champeaux may be explained without the aid of falling sickness.

The disease being real, our colleague is none the less right in taking advantage of its existence; where we differ, perhaps, is on the motive which he draws from it.

Inferior Morality.—Modification of character believed in by him are only to me possibilities, to be dreaded. Shadows, if you wish, but important ones. M. Motet shares in the common views of partial responsibility, from which my theory differs. In his case, in effect, if in place of only apprehending mental lesion, we admitted it in virtue of the precept laid down before we should be, without contradiction, inclined for absolution, implying subsequently sequestration in an asylum.

According to M. Bidart, three months passed without an attack.

M. Motet was witness of one seizure, followed by the immediate return of the moral equilibrium.

The argument, drawn from this circumstance, has an indisputable force.

Certain authors have limited to three or four days the maximum duration of the epileptic disturbance. We know, however, at the present time, that the latent trouble often lasts longer, that it does not invariably succeed to the crisis, and that sometimes even manifest delirium is produced, in the interval of a distant attack. There is one consideration of M. Motet upon which I shall make a special reserve.

Morel had a propensity for extreme generalisations; when he published his researches on epilepsy every one was strongly impressed. But under cover of the morbid masks, under which epilepsy concealed itself, the daring innovator proposed to form a diagnosis capable of recognising them.

Now the impulsive frenzy attributed to the falling sickness, becomes the pivot round which the different features group themselves.

This fact has not escaped M. Motet. He is astonished that the fury of Leveque was not expended at once on the guard. The frequency of such aggressions in judicial proceedings has caused his illusion.

In *treatises* on legal medicine, there are abundant examples of individuals who, a prey to evil impulses, rush on unknown persons, and move with deliberate purpose, sowing death in their path.

But *to those who live in the midst of numerous patients*, this is the exception. Under the empire of mental trouble, some are timid, obsequious, gloomy; most are peevish, susceptible, irritable, complaining, fretful, or engaged in brawls more or less serious; scarcely ten out of a hundred are accidentally subject to sudden fury, instinctive or provoked by hallucinations.

The isolation at Bicêtre, of distant date, might be to a certain degree justified. It had its pendant in an arrest some months later, both being due to a blow of a bottle, but thanks to the intervention of M. Laségue, it did not lead to a second isolation.

The violence was in the temperament and habits, may be, of the patient. It is none the less to be regretted that under this head, a minute inquiry, revealing the true moral constitution, was not allowed to assign exactly the respective parts of his own nature and his nervous anomalies.

In my own case, jury and magistrates took an unfortu-

nate side. I had only given a certificate which was not sufficient. The court, if adopting our advice, should have ordered more ample information, opposing to the disturbance caused by his disease, the contrast of his normal life. This inquiry would have been certainly favourable to the accused, for remarkable for his good conduct, before suffering from the convulsive attacks which caused his discharge from military service where he had obtained honourable advancement, there was since two sides to his character. In the phases of repose, his features, attitude, language, manners, displayed a perfect serenity; he comported himself in a gentle, polished, and resigned manner; after an attack in the period of agitation let us see him. "He continued his task with a febrile precipitation, his eyes animated, haggard, cast over his bronzed and dulled countenance an appearance of gloom; his utterance was tremulous. In his impatience he replied in a sharp manner, uttered bitter complaints, abused everyone, and spoke of extreme resorts. Sometimes this state reached even incoherence, and lasted more than a fortnight."

In cases of need, we take precautions against such patients; a cone would think of rendering them responsible.

In presence of this dilemma, to condemn or acquit, conscience hesitates and is sometimes alarmed. The more principles are uncertain, the more ought we to apply ourselves to search into them, lest in avoiding error we should end with prejudices.

This must be my excuse for details which I have desired to abridge.

Legal Intelligence.

THE CARMICHAEL DUBLIN PRIZE FUND.

ROLLS COURT, JUNE 26.

THE TRUSTS OF CARMICHAEL'S WILL, *ex parte* THE COLLEGE OF SURGEONS, IRELAND.

THE late Surgeon Carmichael, of this city, by his will of the 11th of October, 1849, left £3,000 to the College of Surgeons, the interest of which was to be applied, in pursuance of elaborate directions, set forth in the sequel to his will. Prizes of £200 and £100 respectively were to be given every four years for the two best essays on specified medical subjects. The trust fund produced about £88 a year, or £350 every four years, and out of the balance, after providing for the prizes, the cost of printing 700 copies of the successful essay was to be defrayed. In case no essay of sufficient merit was sent in the prizes were to be doubled in value at the end of the next four years, and any ultimate surplus of interest was to go to the Medical Benevolent Association. In 1869 a scheme was framed in accordance with the founder's intentions, and settled by the late Master of the Rolls, who refused to make any provision for payment of the gentlemen who were to examine the candidates' essays.

Mr. William M. Johnson, Q.C., applied on behalf of the College of Surgeons, that they might be at liberty to apply the sum of £150 out of the trust funds, in paying three of their members £50 each for examining the essays sent in to compete for the prizes payable out of the fund. The petitioners' case, which was supported by the affidavit of Surgeon Colles, was, that the scheme, as settled, had become unworkable from their inability to get competent persons to undertake gratuitously the task of judging the essays, which were generally very numerous and very long. Consequently the college had not for the four-year period ending in the spring of this year issued the necessary advertisements for candidates for the prizes, and they had allowed the first Monday in May—the day fixed for the purpose—to pass without having awarded any prizes. Under the circumstances, they had some doubt as to whether the accumulated balance of interest should go to the Medical Benevolent Association, and had come before the court to obviate such a contingency in the future.

Mr. F. Walsh, Q.C. for the Medical Benevolent Association, argued that, according to the will of the late Surgeon Carmichael, and to the frame of the scheme as settled by the late Master of the Rolls, that association was entitled to the accumulation of interest now standing to the credit of the fund.

The Master of the Rolls, in giving judgment, expressed his deep regret that such an application had ever been made. The late Surgeon Carmichael was a man of great eminence in his profession, and one would have imagined that the Council of the College of Surgeons, out of respect to his memory, if not from a desire to advance science or other motive, would have taken care that these valuable prizes should not be allowed to lapse. The Council should either have refused the bequest altogether, or, after taking it, if they could not get any of their body to judge the essays gratuitously they should have provided remuneration for that out of their own funds. With the greatest respect for the College of Surgeons, he was bound to say that they had acted in this case in a manner not creditable to themselves. He felt coerced by every consideration to refuse the prayer of the petition with costs.

[We regret that the Master of the Rolls considered himself called upon to pronounce a censure of such gravity as this upon the Council of the Irish College of Surgeons, who certainly had no motive in making the proposition they did, but that of carrying out the trusts of the fund in a more satisfactory manner than hitherto. We certainly cannot concur with his lordship that the College should be expected to pay £150 every three years out of its own funds for the adjudication, nor could they, in accepting the trust, have anticipated the difficulty which has arisen. As we have said on a former occasion, it would be equally unreasonable to expect the labour of the adjudication to be undertaken without remuneration.

Considering that on one occasion the essays were five in number, and that one of them occupied the largest part of three manuscript volumes, it is not surprising that Fellows of the College should demur to the duty of deciding on the merits of rival authors.

Medical men are as liberal of their time and labour in the service of their profession as any other class of men; but the task of careful reading of these essays would be worthy of liberal payment, and, if supposed to be discharged gratuitously, would not be discharged at all. Either the College or the fund must pay for such work, and the Fellows would very naturally complain if collegiate money were diverted from more needful purposes for such an object.

Had the Master of the Rolls duly appreciated these circumstances he certainly would not have used the word "discreditable" in connection with the action of the College. By his judgment the Council is, we presume, compelled to proceed with the advertising for prizes, and may find itself in the position of either paying the assessors from its own fund. Should they decline to do so, we don't discover how the adjudication is to be made.]

MEDICAL DEFENCE ASSOCIATION.

THE first annual general meeting of this Association was held on Friday last, June 29th, at the rooms of the Medical Society of London, Chandos Street, Cavendish Square, Dr. B. W. Richardson, F.R.S., the President, was in the chair, and there was a numerous attendance of members. At the request of the President the Honorary Secretary (Mr. George Brown) read the report of the Council, which commenced by giving a sketch of the origin and progress of the Association, and then proceeded to narrate the work which had been done during the first year of its existence. It appeared from this report that the Association has progressed well, and has performed much useful work. The following branches have been formed—the East Anglian branch, Dr. Copeman, of Norwich, President; the North of England Branch, Dr. Dennis Emble-

ton, President; the Sunderland Branch, Mr. J. Davis, President; the Nottingham Branch, Mr. Stanger, F.R.C.S., President; the Shropshire and Mid-Wales Branch, the West Cornwall Branch, the Accrington Branch, and the Forest of Dean Branch. These branches, together with the Central Association, contain nearly 400 members.

No less than seven prosecutions have been conducted by the London organisation, and all have been successful. Besides these cases many unqualified persons have been compelled to cease practising through the action of the Association, and in consequence of members of the Association communicating with the district coroners several inquests have been held on the bodies of persons who have died after having been attended by unqualified men. The provincial branches of the Association have already done some excellent work, having successfully prosecuted in numerous cases of unqualified practice, and other cases are now pending. Among the branches which have instituted prosecutions are the Accrington, the Nottingham, the Sunderland, and the West Cornwall Branches. The report also referred to the action which has been taken by the chemists' trade association, and the claim which the chemists have now distinctly made to the right to practice medicine, and expressed the belief that the Council would be successful in resisting the pretensions of the chemists, and that neither the administrators of the law nor the common-sense of the country will allow the lives of the people to be tampered with by those who have received no medical education.

Since the Association began its prosecutions under the Medical Act, and, as the Council believe, in consequence of that action, the police in Manchester, Liverpool, Birmingham, and Glasgow have made raids on the advertising quacks of those towns, and many of them have been heavily fined.

The operations of the Council, however, have not been confined to the endeavour to check unqualified practice. A committee of the Council was appointed to consider and report upon the Medical Act, with a view to its amendment. That committee met weekly for two months, and produced a report, which was presented to the meeting. A memorial was also prepared and presented to the President and members of the General Medical Council, asking them to take steps with a view to the amendment of the Medical Act, and in December last a deputation from the Association, consisting of the President and seven members of the Council, waited on the President and Executive Committee of the General Medical Council, to urge them to take immediate steps for the amendment of the forty-second section of the Medical Act, so that the fines recovered under that Act within the metropolitan area should not be retained by the police authorities, as is at present the case.

Financially, the Association was shown to be in a satisfactory condition, the report of the Treasurer (Mr. Spencer Watson) showing a balance in favour of the Association of £22, and it was a matter of congratulation that the whole work of the Association had been done for less than £70. The report concluded by thanking the editors of the medical journals for their notices of the Association, and by recommending the organisation to the support of the profession.

After a few remarks by Mr. Mason and Mr. W. B. Hemming, the President moved the adoption of the report. In doing so, he remarked that he had never seen voluntary work done so earnestly as that of this Council. This was strong evidence of vitality. Another remarkable thing about the work of this Association was its cheapness. In respect to the prosecutions, also, the Council had been obliged to use much care and discrimination in selecting suitable cases for prosecution; and, as a result of this care, the Association was now able to say that it had done nothing which had not had a successful issue. These cases also do not by any means represent all which has been achieved. At the breath of the Association many quacks had fled from their places, and a year or two of prosecutions such as these would clear away all the worst of the class. With respect to the General Medical Council which had been referred to by some speakers, the President gave it as his opinion that, as it is at present constituted, it was impossible for a man of independent spirit, who was determined to go straightforward in the path of duty, to get a seat on the Council. There should be direct representation of the general practitioners of the country. As President also, he considered it his duty to thank the Editors of the medical journals, all of whom had been converted to the side of the Association, and he would especially mention the MEDICAL PRESS AND CIRCULAR for its article of June 27th, which he commended to the attention of all the members of the Association. He believed also that there was a strong feeling among the general public in favour of the Association.

The report and balance-sheet were then put, and carried.

The report of the Medical Acts Committee having been adopted, Dr. Danford Thomas moved, Dr. Beech Johnstone seconded, and it was resolved—

"That the President of the Medical Defence Association be requested to communicate with the President of the General Medical Council, with the view of bringing before him the various clauses of the Medical Act as amended by the council of the Medical Defence Association and adopted at the annual meeting."

Mr. W. B. Hemming proposed a vote of thanks to the retiring officers, which was seconded by Dr. Hutchings Williams, and carried.

A vote of thanks was also accorded to Mr. Pridham, the solicitor of the Association.

The following gentlemen were then elected as officers of the Association :—

President.—Dr. B. W. Richardson, F.R.S.

Vice-Presidents.—Dr. Alfred Carpenter; Dr. Edward Copeman; Dr. Dennis Embleton; Dr. Andrew Clark; Mr. James Lane; Mr. Spencer Watson; Dr. Alfred Meadows; Dr. Paul; Mr. W. Bowman, F.R.S.; Mr. E. Cock; Dr. Sansom; and Dr. White, of Snodland.

Honorary Treasurer.—Mr. Spencer Watson.

Honorary Secretaries.—Messrs. George Brown and W. Douglas Hemming.

Council.—H. Adcock, L.R.C.P. Ed.; F. H. Alderson, M.R.C.S.; J. E. Brooks, L.R.C.P. Ed.; G. H. Blackmore, M.R.C.S.; H. Cuolahan, M.D.; T. Cooke, F.R.C.S.; W. H. Drew, M.R.C.P. Ed.; S. Gardner, M.R.C.S.; W. B. Hemming, M.R.C.S.; W. Beech Johnstone, M.D.; C. Royston, M.D.; C. P. Langford, M.R.C.S.; N. C. Maclean, M.D.; J. W. Mason, M.R.C.S.; M. Reid, L.R.C.P. Ed.; W. S. Riding, M.D.; W. Smith, L.R.C.P. Ed.; J. Stevenson, M.D.; G. D. Thomas, M.D.; and H. W. Williams, M.D.

A vote of thanks to the President having been carried by acclamation, and responded to by him, the meeting was adjourned.

WITH the fine open weather of the past few weeks the exceptionally low death-rate of the United Kingdom continues. London is still the healthiest of the large cities of Europe, with a mortality of only 19 per 1,000 of its population. Glasgow shows 21, Edinburgh 22, and Dublin 25, during the past week. Of the large towns in the second category, Portsmouth returns only 13 per 1,000, and Salford 40, the two marking the extreme boundaries of the mortality of the week.

SMALL-POX reached the lowest stage of fatality during the past week in London since November last. The deaths from this disease were only 44, against 55 in the previous week. Of this number 29 occurred in public institutions, the remaining 15 in private dwellings.

WEDNESDAY, JULY 4, 1877.

REVIVAL OF BLOOD-LETTING.

PERHAPS the day is not far distant when blood-letting, in some form or other, will be practised much more frequently than it is at present. "Coming events cast their shadows before," and often those shadows are too dark and well-marked to escape observation. In other words, signs are not wanting that this therapeutic revivalism is nigh at hand. Not that venesection will ever be carried to anything like the extent to which it was carried about the end of the last, and beginning of the present, century. Then venesection was so indiscriminately and largely practised, that its eventual abandonment might have been confidently predicted. The very force with which it swayed the minds of the last generation was its own death-warrant; and like a ball, which rebounds in proportion to the force with which it strikes the ground, so was the reaction that took place against the adoption of any kind of blood-letting nearly in proportion to the unbounded confidence that was formerly placed in this method of treatment.

We have long been of opinion that this great and almost entire banishment of blood-letting from the domain of therapeutical science is by no means consistent with the principles of rational medicine; and it may be doubted whether there are any facts, either of a physiological, a pathological, or clinical nature, which should warrant us in wholly giving up a practice which, notwithstanding its former abuse, has much to recommend it.

If the neglect into which blood-letting has fallen for many years past was entirely the result of advances that have been made in pathology, we should not venture to speak in favour of its occasional and temperate revival. That the progress we have made in our knowledge of the nature and natural history of disease has had something to do with the revolution which has taken place in the practice of medicine, we readily admit. There were two circumstances which powerfully operated in forming the opinions, and in directing the practice of our predecessors. One was their not only attributing nearly all diseases to inflammation, but their supposing that this morbid condition was a manifestation of increased action and exalted function in the affected part, and that consequently the appropriate treatment consisted of such remedies as would produce an opposite state, and directly or indirectly antagonise the morbid condition; as would, to use the language of those days, produce a contra-stimulant or antiphlogistic effect. But recent researches have shown, or, at least, they are believed to have shown, that these opinions are in a great measure erroneous, and that so far from being a sign of increased action and tonicity in the structures affected, inflammation is actually a sign of defective vitality, of deficient innervation, of vascular and tissue relaxation, of perverted nutrition. Holding this doctrine, and one that appeared to be supported by most clearly established facts and the researches of eminent pathologists, it could scarcely be expected that the present and last generation of practitioners would adhere to a method of treatment that was in direct opposition to the views they entertained respecting the nature of a morbid condition which was an important factor in half the diseases they were called upon to treat. Then, again, the ideas of our predecessors with regard to the nature and appropriate treatment of disease in general was far less rational than their doctrines with respect to the inflammatory process. They were too much in the habit of looking upon diseases as so many redundant and abnormal processes, as so many *entities*, the removal, counteraction, or suppression of which was the bounden duty of every true physician. Forgetful of the sagacious aphorisms and judicious admonitions of Hippocrates, or the careful practice of Sydenham, they regarded disease as an enemy to be taken by storm. In their opinion every disease was some adventitious and independent growth, and not, as we know, a complication of morbid phenomena, which are, in a great measure, mere modifications of the various physiological processes that are natural to the human body. They seemed to have no idea that a large majority of diseases, even those inflammations of which they stood so much in awe, naturally tended to a favourable termination. To have treated a case of pneumonia with a little liquor ammoniæ acetatis and a few poultices to the chest, would have appeared to them the height of folly. To have given brandy under the same circumstances, would have been in their opinion actually criminal.

Nevertheless, our contention is that, with regard to the subject we are now considering, the opinion and practice of the present day are partly a reaction upon the erroneous doctrines and indiscriminate practices to which we have just alluded. It has been a matter of common observation that among the many features characteristic of human progress either in science, in politics, or in art, is the fact that any extreme views or practices which have prevailed at any particular period are almost sure to be followed at another period by a reaction in the opposite

direction ; and the history of medicine shows that this department of human thought and toil is no exception to the general rule. It is difficult for our younger readers, used as they are to the cautious and expectant treatment of the present day, to realise the state of practical medicine at the beginning of this century. If they could, they would not be surprised that blood-letting was now rarely practised, considering how much it was formerly abused ; that Bouillaud used to think nothing of taking thirty or forty ounces of blood from a fever patient ; that it was then as common for people to be "blooded" with every return of spring as to cast off their winter clothes ; and that even in cases of rheumatic fever, bleeding has been carried to the extent of producing fatal syncope. We can scarcely wonder at medical men over-stimulating their patients with a liberal allowance of wine and brandy when we remember how much they were in the habit of weakening and half-starving them with bleeding, purging, tartar emetic, and low diet. If the profession are now too much inclined to regard all disease as a manifestation of debility, to be cured by tonics, it is because they used to be always attributing it to inflammation, and to be curing it with the lancet. If Todd thought the best way to cure pneumonia was to administer large quantities of brandy, it was because Bouillaud had before him equal confidence in copious venesection.

If, therefore, the great prejudice which has for some time obtained in the profession against blood-letting is to be partly attributed to a spontaneous reaction in medical opinion and practice, it is only reasonable to suspect that, like all other reactions it may have passed the bounds which reason and prudence should have dictated. It is not unreasonable to suspect that, although our predecessors committed a grave error and did incalculable mischief by their large and indiscriminate bleedings, we have also erred in having gone to the opposite extreme and in having almost entirely abandoned the practice.

Nor is the fact that the knowledge which the older physicians had of the nature of disease, and especially of inflammation, was behind that of the present day, any reason why blood-letting should have been allowed to fall so much in the estimation of the profession. For are we sure that the pathological doctrines which we are now taught, and to which we are told the overthrow of the system of blood-letting is to be mainly ascribed, are firmly established, and are to be reckoned among our most unassailable scientific truths ? Are we sure that this pathology, of which we have so high an opinion, may not be leading us into error not only with regard to the treatment of disease in general, but with regard to our abandonment of a practice in which formerly so much confidence was reposed ?

THE HOMŒOPATHIC SCHISM.

Hahnemann is now dethroned from his position as the leader of homœopathy, and we are assured by the monthly *Homœopathic Review* for July "there are but very few who have any belief at all in those teachings of Hahnemann which are constantly paraded as true homœopathy." We regret this, as we thereby lose the force of a beautiful story told by Addison in No. 195 of the *Spectator*, as it is one of the finest evidences of what might be called homœopathic influence we have ever read of.

It is taken from the "Arabian Nights' Tales :"—A king had long languished under an ill habit of body, and had taken abundance of remedies to no purpose, but at length a physician cured him by the following method : He took a hollow ball of wood, and filled it with several drugs, after which he closed it up so artificially that nothing appeared. He likewise took a mallet, and, after having hollowed the handle and that part which strikes the ball, he enclosed in them several drugs, after the same manner as in the ball itself. He then ordered the Sultan (who was his patient) to exercise himself early in the morning with these rightly-prepared instruments till such time as he should sweat, when, as the story goes, the virtue of the medicaments perspiring through the wood had so good an influence on the Sultan's constitution that they cured him of his indisposition.

We might have speculated on the *modus operandi* of this cure, and explained it on the "dynamic" theory, or on the theory of atmospheric "dilution ;" but now "that these questions have nothing whatever to do with homœopathy or its principles," we must simply look upon it, as Addison did, as an Eastern allegory finely contrived to show us how beneficial bodily labour is to health, and that exercise is a most effectual physic. This tale would also, if Hahnemann's theories were still in vogue, confirm Dr. Sharp's belief that the principles of homœopathy were known in the East in the reign of Vikramadytia, king of Ugayin, who flourished 56 before the Christian era, and that a homœopathic proverb is to be found in a Sanscrit poem called "Sringára Tilaka," written by Kalidása, who was one of the ornaments of the Court.

But now, what is homœopathy ? It is thus defined by the editor of the *Review* :—

"True homœopathy consists simply and solely in the prescribing for disease such remedies as are competent to produce a similar disordered state of health in a healthy person. This alone is homœopathy.

"To carry out homœopathy, it is necessary that drugs be proved on persons in health.

"It is further necessary that the amount of drug given to cure be less than that required to produce disease ; and finally, it is requisite that medicines should be given singly, uncombined with others."

Will this definition satisfy homœopathic followers ? According to it, Dr. Wyld cannot rank himself as one, for in his letter he says :—

"Had I a case of agony produced by the passing of a stone from the gall-bladder or the kidney, I should use anæsthetic or opium. Do opium or chloroform cause stone, or produce pain ?

"Had I a case of paralysis, I should recommend skilful medical rubbing. Does rubbing produce paralysis in health ?

"Had I a case of chronic congestion of the liver, I should prescribe Carlsbad water. Does Carlsbad water cause congestion in health ?"

Will Dr. Hughes, lecturer on Materia Medica and Therapeutics, agree with this definition, holding the views he has with regard to the action of mercury in syphilis ?

Is it not irreconcilable with the action of such a drug

as Ruspini's essence of camphor, which is, or has been, a lauded homœopathic remedy for cholera.

Does camphor produce in health collapse, diarrhœa, and all the other symptoms of cholera ?

If we could feel satisfied that this definition would be accepted by the united body of homœopaths as their *ultimatum*, and as the definition of their views, we should have little hesitation in devoting some of our space to the controversion of the essential fallacies contained therein; but it would be useless to grapple with one shadow and then have to contend with another. For, when we see the father of this school so rudely cast on one side, his idols broken, his "psora," his dynamei, his globular theories scattered to the winds, we can have but little faith in the propagandism or the acceptance of newer theories, and can only expect for them a similar fate—in time.

Notes on Current Topics.

Home Hospitals.

A MEETING in furtherance of the promotion of home hospitals for the well-to-do was held last Thursday, in the Egyptian Hall of the Mansion House, the Lord Mayor presiding.

Mr. H. Burdett, the Secretary, announced that letters of apology had been received from the Duke of Northumberland, Dr. Quain, Dr. Acland, Sir J. Paget, the Bishop of Winchester. Dean Stanley, Lord Lawrence, and others. Whilst describing the origin of the movement, Mr. Burdett stated that it arose from a letter written by him to the *Standard* in April, which was followed by a leading article, in consequence of which much general attention had been directed to the subject, and the result had been the present effort to carry out the scheme. Already the movement had met with a very large measure of support from those who were best competent to give an opinion on this important subject. He then proceeded to state the objects of the movement, which we have already fully stated on a previous occasion.

Mr. J. Walter, M.P., remarked that in spite of the advances made of late years in the direction of great sanitary improvements in the metropolis, they would all agree that they were yet far from the sanitary and social millennium, and they must consider, therefore, the best way of dealing with existing ills. Why, he asked, should it be the case in the metropolis that there were only two classes of people who, when they were ill, either from sickness or accident, were able to enjoy the best medical skill and nursing? While the very rich and the very poor were able to obtain these great advantages, it was absolutely impossible for those who formed the class coming between the two extremes to command the advantages of efficient medical treatment and nursing in cases of long-continued sickness.

Canon Miller expressed his conviction as a clergyman of some age and standing in the ministry that the persons to whom hospitals of this character would be a boon were not to be counted by hundreds or thousands, but by tens of thousands. There was no clergyman who had had experience of clerical ministrations who could not call to his mind hundreds of cases, not among the poor or among the rich, but among the middle classes, which could have been much better healed in a hospital than in the home of the patient.

Sir Rutherford Alcock, Monsignor Capel, Mr. Jonathan Hutchinson, and several other gentlemen spoke in favour of the home hospitals.

On the other hand, Dr. Glover remarked that there were already one or two institutions in London which fulfilled the intentions of the authors of this movement, and he instanced the Fever Hospital and the Small-pox Hospital at Highgate, in both of which patients were received on payment. He did not agree with those who thought sickness or cases of amputation could be better treated in hospitals than at the home of the patient. He believed that a person who had to pay for accommodation in a hospital of this kind would be far better supplied at home.

On the motion of Sir F. Hicks, seconded by Mr. Blake, M.P., the following gentlemen were appointed a provisional committee, with full power to take such steps as they may consider desirable to carry out the objects embraced by the foregoing resolutions:—The Lord Mayor, the Duke of Northumberland, Sir Rutherford Alcock, Mr. Frederick Cleeve, Mr. John Eric Erichsen, Mr. Ernest Hart, Sir Francis Hicks, Treasurer of St. Thomas's Hospital, Mr. E. H. Lushington, Treasurer of Guy's Hospital, Dr. Quain, Mr. Albert G. Sandeman, Mr. George Stanley, Mr. Clifford Wigram, and Mr. F. C. Burdett.

A vote of thanks to the Lord Mayor and to Sir F. Hicks (who took the chair when his lordship was compelled to leave) was passed, which brought the proceedings to a close.

Ether as an Anæsthetic.

OUR contemporary, the *Doctor*, has the following observations on this subject :—

"It has always seemed to us," it says, "the height of folly to declare there could be no danger in any anæsthetic. The lesson taught by the late death from nitrous oxide has, it is to be hoped, been well learned, and we shall in future hear less of the absolute safety of any agent capable of depriving a person of all sensation. Some cases in which ether has been followed by alarming symptoms have lately been recorded. They have been termed syncope, but the word is not appropriate, as the heart continued to beat after respiration ceased. This is what should have been anticipated. When death is produced by ether the animal's heart continues to beat long after the arrest of respiration. The pulse is quickened by ether and maintains its force through a long state of anæsthesia. In these facts lies the safety of ether. But it should never be forgotten that there is danger at a certain stage, and the danger is from the side of the respiration, which at length ceases. Stertorous breathing proceeds from paresis of the muscles of the palate, and should lead to the ether being suspended. So respiration growing more and more shallow and less frequent is a warning and should not be overlooked. It is very rare that the heart fails—perhaps never. Pallor is rare too, and should excite attention if it occur. But we repeat, the danger of ether is from the side of respiration, that of chloroform from the heart, and this fact goes far to explain their relative safety. In chloroform narcosis the danger is much more sudden. Ether gives warning."

These remarks form the soundest and most sensible commentary on the anæsthetic controversy that we have read. The fact is that the use of ether transfers the danger from the heart to the lungs and bronchi. Observation of every case of death reported to have occurred under the use of ether, and of every instance in which we have ourselves witnesssed unpleasant symptoms from that anæsthetic, completely corroborates the statement. But it will be admitted that there is no comparison between the gravity of lung dangers and heart dangers. The former can only arise from asphyxia, which under all circumstances is a slow process; while the latter always arises from syncope, which is sudden and unexpected. The former is plainly visible and can be remedied at any mo-

ment by removing the ether and admitting air to the lungs. The latter gives no warning and is hardly to be dealt with by any treatment whatever. For these reasons no patient need ever to be killed by ether, for he can only be endangered by continuous disregard of the threatening symptoms, while, on the other hand, no anæsthetist, however careful, can be sure of his patient's life when using chloroform.

The Coming Election of the Irish College of Surgeons.

The Council of the College has fixed Monday, the 9th of July, for the election of three councillors in the room of Mr. Wilson and Dr. Cronyn, deceased, and of Dr. Jacob, who has resigned his seat, as required by the Charter, in order to present himself for the Professorship of Ophthalmic Surgery in the College. For these three vacant councillorships the candidates are still as we stated them last week—viz., Dr. Benjamin F. M'Dowel, surgeon to Mercer's and the Lock Hospitals; Mr. Stokes, surgeon to the Richmond, and Professor of Surgery in the College; Dr. Elliott, surgeon to the Whitworth Hospital, Drumcondra, and formerly for many years a councillor; Dr. Collins, surgeon to Jervis St. Hospital; Dr. Corley, surgeon to the Richmond, and Dr. Madden, a retired army surgeon, and a fellow of thirty years' standing.

For the Professorships of Ophthalmic Surgery and Midwifery there promises to be an animated competition. For the first of these offices the probable candidates will be:—Dr. Jacob, formerly ophthalmic and aural surgeon to the City of Dublin Hospital, more recently of the Dublin Eye and Ear Infirmary, and a councillor of the College; Dr. Loftie Stoney, now ophthalmic and aural surgeon to the City of Dublin Hospital, and a demonstrator in the College School; Dr. Rainsford, surgeon to St. Mark's Hospital, and to the Adelaide Hospital, and lecturer on ophthalmology in the Ledwich School; and Dr. Swanzy, ophthalmic surgeon to Steevens' Hospital, and the National Eye Infirmary in St. Stephen's Green.

For the Professorship in Midwifery, which Dr. Cronyn's death has vacated, the probable candidates are:—Dr. Rutherford Kirkpatrick, examiner in midwifery in the College, ex-assistant-physician to the Rotunda; Dr. Roe, obstetric physician to the Coombe Hospital, and examiner in the College; Dr. Macan, obstetric physician to the City of Dublin Hospital, and ex-assistant-physician to the Rotunda; and Dr. More Madden, ex-physician to the Rotunda.

The election to the vacant chairs has been fixed for Thursday, the 2nd of August, and the new professors will be selected in accordance with the charter, by seven councillors, chosen by lot from the twenty-one, which constitute the governing body of the College.

The British Association.

Some of the arrangements for the next meeting of the British Association for the Advancement of Science, which is to commence at Plymouth, on Wednesday, August 15, under the presidency of Professor Allen Thomson, M.D., LL.D., F.R.S., &c., have now been announced. The reception room will be opened for the issue of tickets, &c., at one p.m., on August 13, and on following days at eight a.m.; no tickets will be issued after six p.m. The first general meeting will be held on Wednesday, the 15th, when Professor Thomson will assume the presidency, and deliver an address. On Thursday, the 16th, and Tuesday, the 21st, *soirées* will be held. On Friday evening, August 17, at 8.30, there will be a discourse by Professor Warington Smyth, F.R.S., on the Physical Phenomena connected with the Mines of Devon and Cornwall; and on Monday evening, the 20th, there is to be another discourse, the final arrangements for which have not yet been made. The concluding general meeting will be held on Wednesday, August 22.

The local arrangements are not yet matured, but they will probably include an exhibition of paintings, chiefly by artists of Devon and Cornwall. There will also be excursions to Torquay or Kent's Hole, and the Dart; up the Tamar or Cotehole; to the Moss Clayworks, over Dartmoor; to the Eddystone Breakwater and Government establishments; to the Caradoc Mines; and to Penzance, the Lizard, the Land's End, &c.

In accordance with usual arrangements, the annual meetings of the British Pharmaceutical Conference will also be held in Plymouth, commencing on Tuesday, August 14, at ten a.m. It may also be added that at the last meeting of the Council of the Pharmaceutical Society of Ireland a resolution was passed instructing the Secretary to write to the President of the British Pharmaceutical Conference, expressing a hope that the Conference will meet in Dublin in 1878, at the time of the visit of the British Association.

On the Peristaltic Action of the Intestines.

M. Jules Guerin contributed an interesting communication to the Academy of Science on this subject at one of its sittings.

From observation and experience he concludes—

1st. That the matter contained in the intestine moves not only from the *a tergo* action resulting from simple circular contraction of the muscular membrane, but from a double action, propulsive and aspiratory, caused by contraction of the circular and longitudinal planes of the intestine.

2nd. In virtue of this double contraction, distributed over the continuous parts of the intestine, one of them, the superior portion circularly narrowed, forces its contents towards the inferior portion, which, shortened by the contraction of its longitudinal fibres, meets it, receives the contents, and draws them on by virtue of a kind of aspiration.

3rd. This double movement of propulsion and aspiration is reproduced at each separated point of the intestine, by means of the *valvulæ-conniventes*, the borders of which, placed in contact by the circular contraction, form an obstacle to the retrograde movement of the matter.

This physiological conception is not the result of simple induction drawn from the anatomy of the intestine, but is based on observation and direct experiment. Applying this physiological datum to the stagnation of typhic matter in the inferior part of the small intestine we can understand how this portion, rendered inert by the stupifying action of the toxic agent is deprived of its contractile power, whilst the large intestine is filled by a certain

quantity of old fœcal matter, so that the double action of propulsion and aspiration cannot be carried on.

The ileo-cæcal valve, obstructed on both sides, only allows the passage of the liquid matter accumulated at the end of the small intestine; hence the special liquid diarrhœa during the first days of the disease, and the evacuation of old solid matter at the end of the malady. In support of this view of the physiological mechanism of the intestine, M. Jules Guerin cites those cases of intestinal invagination met with in subjects who have died of typhoid fever.

Lady-Doctors in France.

THE ambition, laudable or otherwise, shown by numerous ladies to enter the ranks of the medical profession, is not confined to the British Isles, for we learn from our contemporary, *Le Paris Médical*, June 21st, that a week since two ladies presented themselves before the faculty of Paris, to maintain their thesis for the doctorate.

One, Mdlle. Zenaide Ocounkoff, born at Moscow, had taken for her thesis the subject "Of the Physiological *rôle* of Sulphuric Ether; its employment subcutaneously as an excitant and stimulant."

This thesis, of sixty-five pages, was maintained on Monday, June 14, in the presence of Professor Verneuil, who congratulated the fair recipient on her success.

On the same day Madame Anna Dahms, born at Mamcheburg, Prussia, in 1848 (we blush for our contemporary in giving the date of the lady's birth, but we suppose we must abandon all such delicacy in future), defended a thesis "On the Thymus in relation to its development and retrogression," in length fifty pages. She was received with the usual amount of felicitations, and testified her appreciation of the hospitality she had received during her four years' study in Paris.

The Paris *Médical* adds:—

"We are not so much behindhand as the Dubois-Raymonds, the Virchows, and the Wundts profess, *ex cathedrâ*, and in their books, else their compatriots would not seek our benches!!!

"Madame Dahms has been received and congratulated. Would it be the same, if we to-day sought a diploma at Berlin, Jena, or Giessen?"

Durham University.

THE *Doctor* says that the opening of this University to practitioners has proved a failure, and thinks that this might have been anticipated in view of the strictness imposed. Our contemporary is informed that three men, over forty years of age, have been up for the M.D., and two have received it. Either the regulations do not meet the case, or the cry for M.D. has been exaggerated, or those who want it are, after all, afraid of a moderate examination.

We are decidedly of opinion that our contemporary *rem acu tetegit* in its last phrase. The class of practitioners who clamour for permission to write M.D. after their names, without possessing any University education, are just the class who are too shallow in their aspirations, and not sufficiently educated in their profession, to venture upon a high-class examination. If a medical man has stood the test of practice for ten years, he will have either made a success or a failure. If the former, he will scarcely care to seek for the empty honour of a doctorate, which gives him no more professional standing than his practising qualifications do. If the latter, he will probably not be the sort of man to win an M.D. by an honest examination.

The Doctor thinks the University of Durham would catch candidates if it lowered the professional age required for the degree to five years. No doubt it would. But why not make the decadence in one step downwards? Why insist on any practical experience at all? Why not give the M.D. to all comers who can pay and pass? That condition once reached, the only difficulty will be to find a respectable practitioner who would allow himself to be called "Doctor" on any terms.

Cold Baths in Infantile Diarrhœa.

IN our issue of the 13th ultimo, we remarked that Dr. Horatio Wood, of Philadelphia, had drawn particular attention to the effect of heat and of the rays of the sun in causing cholera infantum, diarrhœa, enteritis, &c., and to the remarkable efficacy of enforced cold bathing in these cases.

It appears from *L'Sperimentale*, No. 10, 1876, that Dr. Wocke has also been drawing attention to the same plans of treatment. He refers more particularly to the terrible epidemics of diarrhœa which prevail in summer. The epidemic is due, he says, in part to the deleterious influence of the elevated temperature on the infantile organism, and in part to the injurious effect which the heat exerts on the aliment, the milk, and the air inspired. For this state of things he recommends cold bathing, of which he has a high opinion. Wasting children, reduced by vomiting and diarrhœa, were as if regenerated by the second day after the baths were commenced. The restlessness disappeared; sleep was restored, the appetite increased, and the diarrhœa diminished. The cold baths act on the child as a tonic, and internal remedies then exert a better influence.

Dr. Wocke commences his treatment with cold douches to the head and stomach; then passes to baths, commencing at a temperature of 26° C., and reducing them to 22°. Three baths a-day are sufficient.

Transfer of Chronic Lunatics from Asylums to Workhouses.

THE Inspectors, in their late report, complain that the Act passed in the year 1875, the 9th section of which was framed to disembarrass district asylums of chronic and harmless cases of a character similar to those already in workhouses, has not been availed of by boards of governors and other authorities concerned. It has, consequently, so far failed up to the present in the purpose for which it was introduced. This they attribute not to any supineness on the part of those responsible for asylum management, but rather to a belief, amounting almost to a conviction, entertained by some of them, that after all workhouses, admirable as no doubt they are as receptacles for paupers, and those whose malady assumes no pronounced form,

are not the fitting places for lunatics who require the appliances, curative treatment, and other special advantages which can only be found in hospitals for the insane, constituting as they do a class of institutions so distinct and apart from all others, owing to the peculiar and exceptional character of their belongings, that an assimilation of other public charities to them, even in a modified shape, such as the arrangement in question would seem to indicate, will, they are apprehensive, be attended but with limited success.

Sanitation in India.

We understand that her Majesty's Government in India have instructed Surgeon-General Gordon, C.B., to inquire into and report upon the sanitary condition of Ootacamund, which is close to the Neilgherry Hills, the most important European station in Madras. Cholera having so persistently clung to the bazaars of this place, and prevailed in epidemic form during the past few months, the Government have wisely determined to deal with the evil at once; for which purpose they have certainly chosen a most able and energetic officer. Dr. Gordon was engaged on special service by the British Government during the Franco-Prussian war, and his work on "Military Hygiene and Surgery," during that period constitutes the best work on the subject of modern times. He has also written a clever "Pocket Manual of Sanitation" for soldiers and civilians, besides works on cholera, &c. Dr. Gordon will be assisted in his investigations by the Sanitary Commissioner of Madras and the Acting Commissioner of the Nilgiris.

Anomalous Proportion of Married and Unmarried amongst the Insane in Ireland.

In their report to Parliament, the Inspectors of Irish Asylums advert to a very peculiar characteristic in the insanity of Ireland as distinguished from that affliction in the sister countries. In the latter the proportion of lunatics is very much greater among the married than the unmarried; in Ireland, the very reverse occurs in public asylums, while in private the single predominate over the married and widowed by fully five to one. It might appear that prior to puberty there is a large number of insane to be found to account for this; such is not the case; lunacy is a disease not of early life; in fact, not one-twelfth of the inmates of private licensed houses between both sexes are under the age of twenty. The malady, as a rule, being developed subsequent to the twentieth and up to the thirty-sixth year.

Treatment of Headache.

Apropos of what we have said in another place, respecting the administration of medicines in large doses, it appears from the *American Practitioner*, that Dr. Lockeridge has professionally treated sick headache with large doses of bromide of potassium and tincture of aconite. As he truly observes, common idiopathic headache is as near being an *opprobrium medici* as any other common and ordinarily innocuous complaint. He says, that having noticed that the above medicines separately relieved more cases than any remedies he had previously tried, he experimented with large doses of these drugs combined. For several years he has been in the habit of giving in these cases sixty grains of the bromide of potassium, and ten drops of the tincture of aconite-root, in a wine-glass ful of water, the same to be repeated in an hour or two, if the head be not relieved.

Death from Chloroform.

A death under the influence of chloroform took place at Mercer's Hospital, Dublin, last week, there was nothing unusual in the circumstances of the case. The patient was 27 years of age, and of alcoholic habit, and was about to be fired for chronic synovitis of the knee. The chloroform was given in a Skinner's inhaler, an ounce of whisky having been previously swallowed. Before the operation could be commenced syncope and death ensued. The coroner's jury entirely absolved the medical officers from blame as it appeared that every reasonable precaution—short of the use of ether—had been taken to ensure safety to life. The *post-mortem* showed extensive fatty degeneration which was undetected during life, although the patient's heart had been many times examined.

Personation at the Examination of the Pharmaceutical Society.

Last week G. F. Webb, a chemist's assistant, was charged at Bow Street with fraudulently procuring his registration under the Pharmacy Act, 31 and 32 Vic., 1868.

The defendant had presented himself for the preliminary examination, and having failed, allowed one named Hunter to pass the examination in his (Webb's) name. A warrant was out against Hunter, but he was not yet apprehended. He had already been charged with the same offence on a previous occasion.

The defendant at first denied all knowledge of the case, but now expressed a wish to plead guilty to the charge.

The case was adjourned.

The Successor to Giraldes in the Academy of Medicine, Paris.

The place rendered vacant in the section of operative medicine has been filled by the election of M. Rochard, Inspector-General Navy Department of Health, author of a "History of French Surgery in the Nineteenth Century."

The candidates were numerous: MM. Jules Rochard, Panas, Desormaux, Despiès, Guyon, B. Auger. M. Rochard obtained forty-three votes, against thirteen given to M. Panas and thirteen to M. Desormaux, so that the French naval service is well represented in the Academy.

Death of a Surgeon by Drowning.

A boat accident occurred on the River Bann at Portadown on Tuesday week by which two lives were lost. Drs. Biggar and Stevenson, and the servant of the former, went out for a trip on the river, when the boat, upon which a small sail had been hoisted, capsized. Dr. Biggar and his servant were drowned, but Dr. Stephenson, who was observed struggling in the water, was rescued.

Ovariotomy in Dublin.

MR. WILLIAM STOKES performed the operation of ovariotomy at the Richmond Surgical Hospital on the 27th ult. We are glad to learn that since the operation no bad symptom of any kind has supervened, and there is every reason to expect that the case will be brought to a favourable issue. In our next we hope to give fuller particulars.

THREE chemists were fined last week at Bradford £4 10s. each for having sold as "sweet spirits of nitre" articles which contained from 20 to 30 per cent. more water than was necessary or proper.

The defendant's counsel said, that "the article before the court was sold at a certain price, and purchasers knew what they were getting it for; they took it at the price, and did not complain of being prejudiced by it. If a purchaser had asked for the pure spirit of nitre, the person supplying it would have known that he wanted a certain other thing under a different name."

It was obvious to the magistrate that such a defence was not true in substance or in fact. Purchasers in such cases do *not* know what they are getting and ought not to be expected to ask for "pure" spirits on the implication that that sold was impure.

A CHILD, nine years old, died last week at Scarborough of strychnine poisoning. The little creature had crawled to a slice of bread-and-butter covered with "vermin killer," which had been put down for beetles, a portion of which it swallowed, death shortly after ensuing. A coroner's inquest was held and a verdict of "accidental death" returned. We do not desire to relegate to ourselves undue powers, but certain it is that since our comments in May last upon the many unnecessary inquests, fewer have taken place at Scarborough than at any other period.

THE Royal Hospital for Diseases of the Chest, City Road, which has been renovated, refurnished, and partially remodelled, was opened for the inspection of governors and their friends. At five p.m. yesterday a special dedication service was conducted by the honorary chaplain in one of the wards, and was attended by the Members of the Council, the House Committee, the Finance Committee, the Building Committee, rhe Medical Council, the Committee of the Ladies' Samaritan Society, and the Governors of the Hospital.

THE *Naval and Military Gazette* understands that the Secretary of State for War has arranged that the pay and allowances of medical army officers on home service shall be issued by Messrs. Vesey W. Holt and Co., of 17 Whitehall Place, from 1st July next. This is but a return to an old arrangement, for Sir John Kirkland, Messrs. Holt's predecessor in business, was agent to the Army Medical Department for many years. The contemplated change, we may add, will not involve any expense to the public.

THE annual rates of mortality, according to the most recent official weekly returns in foreign cities were—in Calcutta 26, Bombay 61, Paris 25, Geneva 31, Brussels 24, Amsterdam 27, Rotterdam 32, The Hague 24, Copenhagen 24, Stockholm 35, Christiania 33, Berlin 30, Hamburg 28, Dresden 24, Breslau 37, Munich 43, Vienna 29, New York 24, Brooklyn 18, Philadelphia 17, and Boston 19 per 1,000 of the population.

THE following singular death-notice is from the Waco (Texas) *Examiner*: "Died—At the residence of Major W. W. Downs, on Third Street, Monday, August 7, at 10.30 o'clock p.m., Captain D. J. Downs, of voluntary abstinence from strong drink."

THE Scientific Grants Committee of the British Medical Association has advertised for applications for grants in aid of research for the advancement of medicine and the allied sciences.

THE first stone of the Hospital of Levallois-Perret, which is to be built at the sole expense of Sir Richard Wallace, is to be laid this week.

Literature.

LECTURES ON BRIGHT'S DISEASE. (*a*)

THESE lectures have already appeared in our columns in their original form, and therefore our readers will be familiar with the views expressed. In the preface, the author informs us that in this work the lectures are revised and amplified, and may prove acceptable not only to those who heard them but to others, such as practitioners whose time and opportunities preclude the study of more elaborate works. It seems to us that the writer would have made this work more acceptable to the latter class if he had given a more complete sketch of the subject of Bright's disease, and not have devoted so large a portion of his little work to controverted points, on which no absolute decision can as yet be arrived at. The work consists of six lectures, the first comprising the structure and functions of the kidney in health, while the second is devoted to the description of the different forms which chronic kidney disease assumes. The third relates to the causes of kidney disease and the indications thereof. In the fourth the writer considers the causes of œdema, and the views of George Johnson, and of Sir William Gull and Dr. Sutton. As to the conclusions of the two last-named gentlemen, he writes:—"They certainly appear to me to do little towards the elucidation of the nature of the disease under consideration." The theories of uræmia occupy the first part of the fifth chapter, and the tests for albumen the latter portion. In the concluding chapter are considered the prognosis of Bright's disease, and, after a retrospective summary, the treatment of nephritis. The treatment, which occupies but eight pages, is confined to the acute manifestations. Venesection is approved of, together with hot baths. The use of mercury is advocated and that of diuretics, especially the bitartrate of potash, condemned. Diluents are also forbidden. Counter-irritation over the loins is recommended. Scarifications are not approved of for dropsy. "Secondary affections must be treated upon general principles. The diet of the patient should be of a nutritious description, consisting of animal food, milk, &c. Alcoholic drinks should be strictly forbidden." Thus it will be seen that Dr. Campbell Black is inclined

(*a*) "Lectures on Bright's Disease," delivered at the Royal Infirmary, Glasgow. By Dr. Campbell Black, M.D. J. and A. Churchill. 1877. Pp. 146.

to think for himself, and in this little work his views will be found to be put forth in a distinct form.

A GUIDE TO THERAPEUTICS. (a)

THIS is not a very ambitious book, but what there is of it is satisfactory. Dr. Farquharson has prepared us for a sytematic work by his numerous contributions on matters connected with therapeutics. The present work is one for students *par excellence*, and the physiological actions of a drug occupy one column of a page, while in the other column the reader finds the therapeutical use of the drug. Thus, in speaking of the action of chloral, he writes in the first column, "The breathing tends to become slower and finally to cease, from paralysis of the respiratory centre;" in the other column, just against the passage, stands, "This effect on the respiratory centre naturally suggests caution in prescribing chloral in cases of advanced bronchitis with rapidly accumulating mucous secretion and deficient oxygenation of the blood." This is certainly a clear and distinct way of placing the subject before the student; a subject which handled otherwise is apt to be confusing and disturbing. The exposition of the actions of the various drugs is uniformly good and well abreast our most recent information, and the book is a safe guide for students unless they have the misfortune to come before an antiquated examiner. Dr. Farquharson commences his work by some apposite remarks about how to administer drugs, the large and small dose, idiosyncrasies and habit, the accumulation of a drug within the system (which seems made more of than it ought, though not so much as in older books), &c., as well as remarks on the art of prescribing for children. He points out that of some drugs, notably belladonna, children can take as large or larger doses than adults. Also arsenic, strychnia, and iron can be taken by children in large doses as compared to adults. The subject of domestic measurement is also considered. The work on the whole is carefully done, with slight slips occasionally. Thus of atropia 15 grains is not a fatal dose for a rabbit—by which a 3lb. rabbit is usually meant—but 23 grains. And of atropia internally 1-50th of a grain is said to be a safe medium dose, but it will be found for the bulk of patients that 1-75th is quite sufficient, if given to check perspiration. On the other hand, there are many excellent remarks; for instance:—"Whilst a patient is undergoing a mercurial course we must keep up his constitution well with good diet, iron, and perhaps a little stimulant, for experience shows that mercury far more speedily exerts its debilitating influence on weak persons, or those who enfeebled by fasting." In conclusion, we can recommend Dr. Farquharson's little work very cordially to students, for whom it is designed rather than for practitioners.

THE JOURNAL OF PSYCHOLOGICAL MEDICINE. (b)

THIS journal continues to maintain its high literary and scientific reputation. The last number, which appeared in April last, contains a numerous list of articles on philosophical and scientific subjects, interesting alike to the general and the medical public.

In the first article Dr. Winn points out in particularly clear and forcible language the fallacies of the new school of physiological psychology, which he designates as materialistic physiology.

Dr. W. A. F. Browne, whose valuable contributions have so often enriched the pages of psychological literature, has contributed a paper styled "Religio-Psycho-Medici." It is eloquently written, detailing the duties of the psychological physician, and containing many passages which embody the highest aspirations of our nature. Dr. Browne is not a mere theoretical philanthropist; he is well known as one whose life has been practically devoted to the cause of humanity.

In addition to these articles, there are able contributions from Drs. Sankey, Fothergill, Boyd, Mann, Myers, Rouse, Savage, and Bockhammer.

The reviews are well worth perusal, especially one on the "Functions of the Brain," by Dr. Ferrier.

Medico-Parliamentary Intelligence.

INDIAN MEDICAL SERVICE.

Sir C. O'LOGHLEN (in the absence of Mr. Stacpoole) asked the Under Secretary of State for India why the examination of medical officers for promotion to the rank of surgeon-major was retained in the Indian army, although discontinued in the British army.

Lord G. HAMILTON: The discontinuance of the examination of medical officers for promotion to the rank of surgeon-major in the British army was coincident with an entire alteration in the constitution of that service, whereby the greater number of those officers will not be eligible for promotion at all, as their term of service is to be only ten years in all, whereas twelve years' service are required to qualify for promotion to the rank of surgeon-major. No such change has been made in the Indian service; and the grounds whereon the system was originally adopted as desirable in the British service still hold good there. The point has, however, been brought to the notice of the Secretary of State by the Government of India; but as a report on the general question of the organisation of the entire Indian medical service is shortly expected from India, it was determined to await that report before coming to any decision on this individual point.

Correspondence.

PRIVATE ASYLUMS AND PRIVATE PATIENTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have read with much interest the letters by "Humanitarian" and "Libertas," which have appeared in your columns, on "Private Asylums and Private Patients." I regret, however, that the subject has been discussed before the Committee, now sitting to consider the operation and the general working of the Lunacy Laws, have published their report. The point raised by your correspondents is whether the liberty of the subject is properly protected by the present provisions in our Act which relate to "lunacy certificates." Cases have been cited in which certificates have been given apparently in a careless or improper manner. This of itself proves nothing, as every system has its abuses. We must not condemn our present procedure in lunacy because there are some ignorant persons in it who are unable to detect between dipsomania and insanity, and who give lunacy certificates in the former of these maladies. Your correspondents appear to lose sight of one of the most important points connected with the incarceration of persons in asylums; I refer to the suspension of these documents by the Commissioners. The medical certificates which have been brought forward as being insufficient for the purpose, as evidence of a person's insanity must be accompanied by an order signed by someone who is supposed to be acquainted with the mental state of the patient. These certificates are copied by the superintendent, and forwarded to the Commissioners in Lunacy within twenty-four hours from the patient's admission into the asylum. If there are any informalities or mistakes in them, they are returned by the Commissioners for alteration or amendment, fourteen days being allowed for this. If the Commissioners are not satisfied with the facts stated in the lunacy certificates, and if in the time allowed for the amendment stronger facts of insanity cannot be stated, the patient

must be discharged. The course of action then is clear; an action against the medical men who signed the certificates can be brought by the patient.

We see, therefore, that to detain a patient wrongfully in an asylum there must be an *apparent* conspiracy between the medical men who signed the certificates, the person who signed the order, the proprietor of the asylum, the superintendent, and the Commissioners in Lunacy. We very rarely hear of a case of prosecution against medical men for improperly certifying in cases of lunacy.

I have been for many years resident at an asylum, and am able to state, as the result of practical experience, that I have never known any case admitted on improper certificates, and I have never seen a patient who was wrongly detained. The desire of the superintendents of private asylums is to discharge their cases too soon, rather than to detain them after recovery.

Our lunacy system works well. We have a most effective body of Commissioners in Lunacy, who visit asylums six times a year, and who perform the important duties of their offices in a complete way, protecting the interests of the insane to the utmost. I deny the allegation, stated by one of your correspondents, that collusion is possible under the present working of our Lunacy Act. This is utterly impossible, as I have shown at the commencement of this letter.

It is not my intention now to enter into a consideration of private asylums. I propose, however, when the Committee have terminated their inquiry, to consider in detail the evidence given before them, and which, for obvious reasons, I now refrain from referring to. I hope, however, that I have now said sufficient to convince your readers that the present system of our lunacy practice works well, and is a sufficient protection against improper incarceration.

I am your obedient servant,

L. S. Forbes Winslow.

Cavendish Square, London, W.

THE POPULATION QUESTION, IN REFERENCE TO THE LATE TRIAL OF REG. *v.* BRADLAUGH AND BESANT—"THE FRUITS OF PHILOSOPHY."

By Charles R. Drysdale, M.D.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—When the case of Mr. Bradlaugh and Mrs. Besant came first on for trial before Alderman Figgins at the Guildhall, you expressed yourself as astonished that my "well known" love of the views of the *Modern Malthusian* should have led me so far as to become bail for the able lady defendant in the case. At that time my mouth was closed, because the case was *sub-judice;* and I find your long editorial article of this day (June 27th) such an immense advance on the spirit of the paragraph I refer to, that I am in hopes you will ere long be like myself, an ardent follower of the teachings of J. S. Mill, Joseph Garnier, Chalmers, and Sismondi, and come to believe that the production of a large family in an already over-crowded country like this is the greatest of all social misdemeanours that any citizen can be guilty of.

With regard to the question of the *free discussion* of this momentous question, I think I will convince you and your readers that *it* is now becoming imperative, when I say that it is demanded by such men in our profession as Sir H. Thompson, Dr. Hardwicke, Mr. Erichsen, Dr. Morell Mackenzie, and Dr. Palfrey; and, out of our ranks, by Professor Alex. Bain, Professor Hunter, and Sheldon Amers, with a perfect host of able thinking men in the bar, and in our own profession. I, indeed, quite agree with Mr. John Stuart Mill when he exclaims, "Little advance can be expected in *morality* until the production of a large family is regarded in the same light as drunkenness, or any other physical excess;" and I will now proceed to lay before you what are my reasons for so believing.

Mr. Malthus, writing in 1798, and his followers, F. Place, John and James Mill, Ricardo, Senior, Fawcett, Cairnes, and a host of economists, have shown that there is a constant *tendency* in all animated beings, including ourselves, to increase more rapidly than the means provided by nature for our subsistence. In our race, a woman commences to menstruate at 15, and continues apt for reproduction until the age of 45, or 30 whole years, during which time she might easily on an average give birth to 12 or 15 children, if in good health. It is this constant *tendency* towards rapid reproduction which causes the present most unsatisfactory state of hygiene among the poorer classes in such long and over-peopled countries as this. In the United States of America the tendency to increase rapidly is evinced by the fact that ever since 1780, the population was doubled in some 20 to 25 years, in many instances entirely *without* counting immigrants. We, at our most rapid times, have never doubled our numbers more rapidly than in some 52 years. Hence, it is as clear as a sum in addition, that we, and especially the French, who remain stationary in numbers altogether, must have had our increase checked by some causes.

These causes must have been, in the language of the economists, either preventive or positive. The positive checks to *our* increase have partly been early death among the children of the poor. For instance, in the wealthy parish of St. George's, Hanover Square, the deaths of children under five years of age only form one-third of the annual number of deaths; whilst in Bethnal Green they form one-half of all the deaths. Mr. Charles Ansell, actuary to one of the Insurance Companies of London, lately made inquiries as to the death-rate among well-to-do persons of the upper classes; and from his tables I estimate that nearly three times as many children die, out of 100,000 born, in the first year of their life among the poorer classes as do among the rich. Also that, whilst the average age at death among the richer classes is at present in England 55 years, it is only 35 years among the poorer classes. This, then, is the positive check which prevents us in Britain doubling our numbers so quickly as the inhabitants of the United States. The *preventive* check to population in this country is well exemplified in the late marriages seen on all sides of us. *Our* women do not marry before the average age of 24, whilst in Hindoostan girls are often mothers at the age of 12. And we have besides hosts of old maids who never make any use of their powers of reproduction at all. Then, again, prostitutes, as I know well from my own experience as physician to the Rescue Society's Lock Hospital, are almost invariably barren, and our society contains hosts of such women.

It will thus be seen that we, the inhabitants of Europe, have only a sad choice to make between early death, celibacy, or deliberate prevention of births (*conjugal prudence*) after marriage. I confess I prefer the last of the checks infinitely before the others, and I consider that Dr. Knowlton, the able and benevolent Boston physician who, forty years ago, tried to make such *conjugal prudence* accessible to all, was not only not a bad man, but, indeed, one of the best of men and of physicians.

I can, I confess, see nothing but the highest morality in making the most important of all human actions—the generation of human beings—become amenable to the deliberations of intelligence and prudence. In the Œcumenical Council, indeed, held at Rome in 1870, one of the holy fathers of the Catholic Church prayed the Council not to insist on this *conjugal prudence* being pronounced by confessors as a "deadly sin," seeing that people would practice it, and the more so, as they became more civilised and amenable to reason.

Dr. Mayer, in his able work "Rapports Conjugaux," which has gone through many editions in Paris, mentions that there is not a family in France at present that does not have recourse to some of the "checks" mentioned by Dr. Knowlton in his now classic pamphlet; and no medical man of any experience can fail to be aware how many married men in *this* rather hypocritical country have made use of such practices, and are continually doing so every day. My experience shows me that among the well-educated classes here, few families are ever so large as they might be, were such means not made use of by the father. And, frankly, I heartily applaud all who take sedulous care never to bring into the world what has been called an "unwelcome child."

Take, again, those tragical cases where a woman has a contracted pelvis. Are we to see with patience such women, as I have done, again and again impregnated, and then forced to have recourse to the obstetric surgeon to

produce premature labour, without pointing out that the real duty in such cases is to prevent impregnation by simple means? To say no is to be a grown-up baby, in my humble judgment.

Medical men should be the last persons in society, too, to counsel late marriage, or to entertain life-long vows of chastity. This advice is to the last extent opposed to happiness, to health, and to true morality. Sir B. Brodie is but one of those who have pointed out that the evils of celibacy are worse even than those of disease-producing prostitution. Insanity, masturbation, and impotence are too frequently the result of protracted celibacy, especially in the male.

In short, I hold that, in order to get rid of the worst evils of society, such as early death, prostitution, and celibacy, the only choice for rational men and women lies in early marriage, accompanied by *conjugal prudence*.

I remain, Sir, yours obediently,

CHARLES R. DRYSDALE, M.D., M.R.C.P.Lond., F.R.C.S.Eng.,

Consulting Physician to the Farringdon General Dispensary, London, and to the Rescue Society's Lock Hospital.

17 Woburn Place, W.C., June 27, 1877.

*** We are at a loss to detect any line of argument in Dr. Drysdale's letter which could be advanced to justify the publication of the pamphlet entitled the "Fruits of Philosophy."

Much of the letter is entirely illogical. Dr. Drysdale says that women in this country may easily on an average give birth to twelve or fifteen children, and as this country has never doubled its number more rapidly than in fifty-two years, hence the increase has clearly been checked by some causes. From this, one might gather that Dr. Drysdale believes the checks to conception to be already thoroughly understood by those who are giving birth to children; and if so, why would he publish to all the world, young women and old, what is already well known to those whom he would desire to benefit by the publication.

The tables which he quotes of deaths among the poor compared with the rich, show nothing more than that a greater number of poor children than rich die, but they entirely fail to show how the comparative number of deaths among the poor would be decreased except by inferring that by checks to conception, some of the poor children who have died would never have been born.

It may be a painful reflection that so many more children of the poor die under twelve months of age, but the causes of death are ascertained, and doubtless much improvement will take place in this respect under our increasing knowledge. But most assuredly the fact that so many die in the first year is no argument in favour of the publication of this immoral pamphlet. It may betoken ignorance and inattention on the part of the mothers, but it is the least expensive part of the life of the child, and for several months absolutely costless so far as regards food.

The next and most important point touched upon by Dr. Drysdale is the question of late marriages. If he could show how young people might be enabled to enjoy the blessings of married life, it would, indeed, be a boon to the middle class of society; but here, again, he fails. The question of late marriages scarcely, if at all, affects the working class. As soon as the youth of nineteen can be called an able-bodied man he obtains a weekly income, which he will increase but little throughout the rest of his life, and he marries early in life; but the middle class professional men—men who are working their way in business in city offices; men who hold a certain social position with a good education, and who can scarcely be considered to have made a good footing in the world until they are nearly forty years of age—such men are unable to marry until late in life. But is it the question of children that stands in the way of their marriage? Not at all. As bachelors they are wealthy; as householders, with a wife and an altered position in social life, they are unable to meet the expenditure entailed.

We look upon the pamphlet as immoral in the extreme—not calculated in any way to relieve the misery which it refers to; but, on the contrary, written in such a style, and made public in such a manner, as to induce prostitution among those women who are not fortunate enough to be able to enter the married state. The publication and sale of the pamphlet is evidence either of vicious intent or of gross indiscretion against the authors. In a recent article we have exonerated them from the former; of the latter they will ever stand charged.

Obituary.

DR. JOHN CRONYN.

THE memory of Dr. Cronyn, who died last week, after a long illness, will be revered by his brethren alike for his social as for his professional qualities. A man of the most genial and sympathetic temperament, and the most generous and kindly disposition, his loss has been regarded with more of personal regret than that which it would have excited if he had been regarded simply as a professional brother; and those who knew him best, must feel that they have lost not only a compeer but a friend.

John Cronyn was a native of Callan, in the County Kilkenny, his father and brother being also medical men. He received his first professional training in the Meath and City of Dublin Hospitals, and in the Schools of the College of Surgeons and Cecilia Street. Having qualified as Licentiate of his college in 1847, he returned to the country and started in practice at Erroll, in the Queen's County, whence he removed to Maryboro, and after a short stay in that town was appointed to the Dispensary and Fever Hospital at Gowran, in the County Kilkenny, in which office he remained for over seven years, enjoying the good will of every one in his district. That his departure from it was regarded with sincere regret is manifested by the fact that on his retirement in 1862 he received a gift of a handsome watch and chain and an address expressive of the good-will of his professional constituency in the county. He had come to Dublin for the purpose of taking a position as an obstetric surgeon, and he made his first entry into that position as Assistant-Physician to the Rotunda Hospital, where he remained for the usual period of three years. From thence forward his professional career was successful and full of promise. In 1868 he was appointed medical attendant to the employés of the Bank of Ireland, and shortly afterwards took a seat in the Court of Midwifery Examiners of the College of Surgeons, of which he was chairman for several years. In 1874 he was chosen by the Council to act as *locum tenens* for Dr. Sawyer in the Professoriate of Midwifery, and he delivered the course of lectures until the resignation of Dr. Sawyer, when he received at the hands of the Council the full honours of the Professor's chair. Shortly afterwards he took a place in the administrative body of the college as its councillor, and last year took a further step towards professional celebrity, having been appointed Vice-President of the Obstetrical Society. Unhappily, the future which held out such hopes of success for him and of credit to his profession was never realised, for he was, some two months since seized with an inset of gouty pneumonia, which resolved itself into a series of most alarming symptoms, against which his vigorous constitution battled in vain. Eventually, plugging of the veins and extreme anarsarca set in, and the untiring efforts of Professor M'Dowel

and Dr. Banks, his attendants, proved unavailing to arrest the progress of the disease. Had he lived he would, undoubtedly have inscribed by the force of his talent, his industry, and his social qualities, his name upon the already replete roll of Irish Obstetricians, who have left their mark in the profession. It was otherwise willed, yet his memory lives in the affections of those who knew him either as a friend or as a medical adviser.

Medical News.

Queen's University in Ireland.—At a meeting of the University, held on June 18, the following degrees were conferred:—Doctor in Medicine—Archibald R. H. Bland, Wm. Henry Bracken, George Henry Bull, William Corry, Robert D. Donaldson, Hugh L. Donovan, J. Kent Fairclough, Denis Harrington, Henry O'Neill, Wm. A. Quayle, Robert H. Robinson, Henry George Thompson, Wm. Henry Thornhill, James Tidbury, Charles Workman. Master in Surgery—J. J. Adams, A. R. H. Bland, George Henry Bull, William Corry, Robert D. Donaldson, Hugh L. Donovan, J. Kent Fairclough, John Mulrenan, William A. Quayle, Robert H. Robinson, Henry George Thompson, William Henry Thornhill, James Tidbury, Charles Workman. Licence in Midwifery—J. J. Adams, Archibald Bland, George H. Bull, William Corry, Hugh L. Donovan, William A. Quayle, William H. Thornhill, James Tidbury, Charles Workman.

St. Andrew's Graduates' Association.—The ninth anniversary session of the Association was held at the Westminster Palace Hotel, on Thursday, June 28th. The Dean of Westminster, Lord Rector of the University, very kindly conducted the members over the abbey in the afternoon. At the dinner Dr. Lush, M.P., was in the chair, and was supported by Lord Gordon, Mr. Ramsay, M.P., Mr. Walter James, M.P., Mr. Rowley Hill, M.P., Dr. Cameron, M.P., Mr. Knight, M.P., Professor Smyth, M.P., Dr. Mitchell, Dr. Bucknill, Dr. Crichton Browne, Mr. Balfour Browne, Dr. Richardson, F.R.S., Dr. Day, of Stafford, Dr. Paul, Dr. Cholmeley, Dr. Weir, of Malvern, Rev. Dr. Rogers, Dr. Sedgwick, and many other country and London graduates. Dr. Paul was presented with a handsome claret jug and goblets for his services as treasurer, since the foundation of the Association. The attendance of Dr. Lyon Playfair, M.P., was unfortunately prevented by his parliamentary duties. The following were elected as the Executive for the year 1877-8:—Dr. Richardson, *President of Council*. Dr. Paul, *Honorary Treasurer*. Dr. Sedgwick, *Honorary Secretary*. *Council*:—Dr. Cholmeley, Dr. Christie, Dr. Cleveland, Dr. Crosby, Dr. Henry Day, Dr. Dudfield, Dr. Griffith, Dr. Griffiths, Dr. Holman, Dr. Lawrence, Dr. Lush, M.P., Dr. Macintyre, Mr. Menzies, Professor Pettigrew, Dr. Julius Pollock, Rev. Dr. Rogers, Dr. Joseph Rogers, Dr. Lawes Rogers, Dr. Cooper Rose, Dr. Royston, Dr. Scott, Dr. Seaton, Dr. Whitmore, Dr. Willett, Dr. Duckworth Williams, Dr. Rhys Williams, Dr. Wiltshire, Dr. George Bird, Dr. Falls, Surgeon-Major Franklin, Dr. Mortimer Granville, Dr. Kesteven, Dr. Charles Mott, Dr. Bransby Roberts, Dr. Stocker, Dr. Weir.

NOTICES TO CORRESPONDENTS.

Notice to Subscribers.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in London, Dublin, or Edinburgh.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Scarce Numbers.—Double price will be given for the following numbers of this Journal if sent to the London office:—October 6, December 22, 29, 1869.

A certain Physician, says a lay contemporary, upon being questioned the other day about the health of a friend, replied, "Yes, he is very ill!" "Does he keep his bed?" asked the questioner further. "Of course he does," replied the medical wag, "You don't suppose he is fool enough to sell his bed when he wants it so badly?"

Dr. Croft.—The report which you stated in your letter, dated June 20th, had been forwarded by book-post, has not been received yet.

How is Quackery to be Remedied.—The correspondence on the leading article which appeared in our last on this subject is unavoidably held over till next week.

Dr. Gordon will find the matter referred to in another column.

Dr. Forbes Winslow has forwarded us a letter which will be found in another column, on the subject of lunacy certificates, he is unwilling to enter into the general question of private asylums which has been discussed in our columns, and other matters connected with lunacy until the lunacy committee, now sitting, have closed their inquiry. We are promised, however, a full consideration and discussion on a future occasion. Dr. Forbes Winslow maintains that our present lunacy system is sufficient for the purpose, and is a protection against the liberty of the subject being unfairly dealt with. We shall look forward with great interest to further communications, and also to the report of the committee on this important question.

Medicine and Advice for Fourpence per Head.—Our contemporary the *Lancet*, anxious as usual to supply its readers with "the latest news," announces in its last number a fact which it has just discovered: that Mr. J. Oliphant Brett, of 53 Exmouth Street, Clerkenwell, is content with the modest fee of fourpence in the morning, and sixpence in the evening. Perhaps our contemporary would be surprised to learn that more than *eighteen months since* we received notice of an action for libel for commenting upon this very thing, and that twelve months later we were mulcted in £50 damages and about £250 costs for so doing. Not that our contemporary need fear anything of the kind for its exposure, beside having the demerit of being ancient, is also incorrect and misleading in the most particular point, the name of the individual. The action was brought aagainst the Medical Press and Circular by Mr. J. Oliphant Betts, the *Lancet*, probably to avoid our fate, gives a false name and styles him Mr. J. Oliphant Brett. *Tempus omnia revelat*, so does our contemporary eighteeen months date.

VACANCIES.

Royal Free Hospital, Gray's Inn.—Junior Resident Medical Officer. Board is provided, but no salary. Testimonials to the Secretary. (See Advt.)

Seamen's Hospital, Greenwich.—House Surgeon. Salary, £50, with board. Applications to the Secretary.

West Kent Hospital, Maidstone.—Physician. Honorary. Testimonials to the Secretary.

Warwick County Lunatic Asylum.—Junior Assistant Medical Officer. Salary, £100, with board, &c. Apply to Dr. Parsey, Hatton, Warwick.

County Asylum, Prestwich, Manchester.—Third Assistant Medical Officer. Salary, £100, with board. Applications to the Superintendent.

Cumberland Infirmary.—House Surgeon. Full particulars of the Secretary, Ash House, Carlisle.

Wolverhampton General Hospital.—Physician's Assistant and Pathologist. Salary, £50. with board. Applications to the Chairman.

Carrick-on-Suir Union, Carrick-on-Suir Dispensary.—Medical Officer. Salary, £115 per annum. Applications to the Hon. Sec.

Lismore Union, Balliduff Dispensary.—Medical Officer. Salary, £120 per annum. Applications to the Hon. Sec.

Sligo Union, Sligo Dispensary.—Medical Officer. Salary, £100 per annum. Applications to the Hon. Sec.

APPOINTMENTS.

Bennett, A. H., M.D., M.R.C.P.L., an Assistant Physician to the Westminster Hospital.

Biggs, R., M.R.C.S.E., Medical Officer to the Bath Union Workhouse.

Campbell, J. A., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer, &c., for the Dungiven Dispensary District of the Limavady Union, co. Londonderry.

Cant, Mr. W. I., Assistant House Surgeon to the General Hospital, Nottingham.

Davies, J., M.R.C.S.E., Medical Officer for the No. 1 District of the Bath Union.

Johnson, R. L., L.R.C.P., M.R.C.S., &c., Senior Assistant Surgeon to the Provident Surgical Appliance Society.

Jones, R., L.R.C.P.Ed. & L.M., L.F.P.S.G., House Surgeon to the Carnarvonshire and Anglesea Infirmary and Dispensary, Bangor.

Maunsell, J., M.D., L.R.C.S.Ed., Medical Officer for No. 2 District of the Bath Union.

Mitchell, C. J. C., M.R.C.S.E., Assistant Medical Officer to the Birmingham Workhouse.

Ord, Dr., Physician to St. Thomas's Hospital.

Rainsford, R., M.B., C.M., F.R.C.S.I., Senior Surgeon to St. Mark's Ophthalmic Hospital, Dublin.

Deaths.

Cooper.—On June 23, at Brentford, Middlesex, George Cooper, F.R.C.S.E., aged 84.

Garstang.—On June 21, at Bolton, Thomas B. Garstang, M.R.C.S.E.

Gompertl.—On June 23, W. F. L. Gompertz, F.R.C.S., late R.L. Militia, aged 55.

Lallemand.—On June 20, at Sutton, Macclesfield, Frederick Francis Lallemand, F.R.C.S.E., aged 70.

Martin.—On June 19, at Donaghmore, Nerw, John Gibson Martin, Surgeon, aged 81

Randell.—On June 22, at Singapore, Henry Lloyd Randell, M.R.C.S., Surgeon-Major, Army, Principal Civil Medical Officer, Straits Settlements, aged 43.

Watson.—On June 17, at Gerrard Street, Islington, Frederick Hastings Watson, L.R.C.P.Ed., aged 34.

IRISH POOR-LAW INTELLIGENCE.

ABSTRACT OF THE PARLIAMENTARY REPORT ON LUNATIC ASYLUMS IN IRELAND.

In order to afford more definite information on the subject we subjoin a comparative table of the number of the mentally affected of all classes, both in public and private institutions throughout the kingdom, as well as of those returned to us as being at large or with their friends at the close of the past and the immediately preceding twelvemonth.

On the 31st December, 1875, there were—

	M.	F.	T.
In Public or District Asylums	4,142	3,599	7,741
In the Central Asylum for Criminals	134	38	172
In Lucan Govt. Asylum	7	22	29
In Private Asylums	271	382	653
In Poorhouses	1,275	1,904	3,179
In Gaols	1	2	3
Making a total of	5,830	5,947	11,777

On the same date, 1876, there were—

	M.	F.	T.
In Public or District Asylums	4,340	3,733	8,073
In the Central Asylums for Criminals	132	34	166
In Lucan Government Asyl.	4	20	24
In Private Asylums	257	387	644
In Poorhouses	1,268	1,948	3,216
Making a total of	6,001	6,122	12,123

But, as observed by us in a former parliamentary report, the returns of the insane at large, or of the non-officially registered, for the most part collected, and on the same day, by a very intelligent body, the constabulary, cannot, in all cases, be accepted as necessarily accurate, although we are supplied with the name, age, character of the disease, religion, and residence of each individual mentioned in them. Under the heading of lunatics, between both sexes, there are 934. Of idiotic, 4,367, and of imbeciles and epileptics, 1,306. 4,646 belong to the humbler community, the difference, 1,961, to the middle and upper classes.

As a rule, the unregistered above adverted to are maintained by their families, save when becoming intractable or dangerous, they are received into poorhouses, or as generally occurs, are either committed by magistrates to district asylums as paupers, or sent by their friends to private licensed houses.

With reference to the insane in unions, the great majority of the actual lunatics, or of those who had formerly been in full possession of their reason, and amounting to 1,429, have been for years located in them, aged, decrepit, and hopelessly demented. Unaccustomed to asylum treatment they have become habituated to their position; the remainder coming under the denomination of idiots, imbeciles, and epileptics, form a total of 1,787.

With reference to the immediate operation of district asylums during the past year, we first advert to the number of patients in them on the 31st December, 1875, viz., 7,741. In the course of the following twelvemonth the admissions were 2,344, raising the aggregate under treatment to 10,085—5,400 males and 4,685 females. Of the admissions, 232 only—101 men and 131 women—were effected through the legitimate mode, namely, by order of Boards of Governors, or of the Inspectors. 798—367 and 431—of either sex respectively were taken in by Resident Medical Superintendents as urgent on their own authority; while 1,239—737 men and 502 women—were committed by magistrates as dangerous lunatics, some few we are compelled to remark on rather frivolous pretexts, but to whose cases we directed immediate attention, and 75 by warrant of the Lord Lieutenant—53 males and 22 females. The great advantage, and one so needed, of having patients admitted by Boards, consists in the certainty, that thereby there proper chargeability will be secured, and in each case useful information as regards the individual's past history afforded on the form of application, whereas in the other modes of admission the statements, generally speaking scant and unreliable, render a subsequent treatment difficult, at least in the beginning, and the liberation of recovered patients unless placed directly under the care of friends on leaving the institution unsatisfactory, a state of things we have endeavoured to combat as much as possible.

The discharges in 1876 as cured amounted to 970—506 males, 464 females; the improved to 225—130 and 95 of each sex. Twenty-five males and 22 females were taken home by their friends incurable, but tranquil; some few of them on recognisances, they have previous to admission evinced dangerous or vicious tendencies.

The deaths within the same period reached 765—395 men, 370 women—including four suicides three of them males; on each a coroner's inquest was promptly held, and verdicts of an exonerating character returned, in one instance, however, with an expression of opinion by some members of the jury, that the window from which the deceased threw himself was not constructed with due strength against such an occurrence.

On the score of mortality 796 deaths; the average ratio to the total in asylums during the past year was 7·60 per cent., comparatively speaking not an unfavourable proportion, for it should be also remembered that the insane are subject to the combined and depressing influences of physical and mental disease, and the reaction of one on the other, a condition which can be diminished only by proper asylum treatment, and the benefits derivable from constant care, good dietary, exercise in the open air, and suitable occupations.

The per-centages of deaths would on the whole be almost one lower, were it not for the unusual mortality at the Metropolitan Asylum in consequence of a very fatal epidemic of pulmonary affections, which continued rife for some months in the city.

3.30 p.m.—Slept the greater part of the morning. Still continues the same nourishment.

12th, 3.30 a.m.—Has not slept. Temp. 99·8. Morph. subcut., gr. 1-3rd.

10 a.m.—Temp. 98·4; pulse 103. Slept till 8 a.m.

13th, 10.30 a.m.—Temp. 100·4; pulse 110. The pedicle has risen up and filled the opening caused by the drainage-tube; a hard tumour felt immediately below the wound, probably the uterus. The last suture removed.

10 p.m.—Temp. 101·6; pulse 110. Much worried by noise in the street. Flushed and heated. Ordered a bromide draught.

14th, 10.30 a.m.—Clamp removed. Discharge from pedicle to be dressed thrice daily. Temp. 100; pulse 110. Enema ordered, but did not act.

10 p.m.—Temp. 100; pulse 100. Has vomited slightly; pill ordered.

15th.—Vomited pill. Temp. 99; pulse 96.

16th.—Temp. 98·4; pulse 100. Slept well. No pain. Pedicle discharging. Bowels not opened. Tongue clean.

17th.—Bowels opened three times slightly. Complains of a sharp pain in epigastrium, which passed off. Morph., subcut., gr. 1-3rd.

From this time the patient went on uninterruptedly well. The temperature varied a good deal without apparent cause. No stimulant of any kind was given, but milk and soda-water with ice was given in small quantities at frequent intervals.

Case II. Reported by Mr. Andrew Horne.

Rose C., an unmarried woman, æt. 30, was admitted into the Auxiliary Hospital, May 8, 1877, being the subject of ovarian disease. Her history was that she had always enjoyed good health until two years ago, when, without any assignable cause, she began to suffer from pain in the left ovarian region. This continued off and on for more than a year, when she noticed that the lower part of the abdomen was enlarged; this quickly increased in size, the pain at the same time diminishing. Last October she became so large, that her breathing was greatly embarrassed, on account of which she consulted Dr. Trotter, of Summerhill, who deemed it advisable to tap her. He removed a large quantity of dark, thick fluid, after which she experienced great relief for a month; but the pain returned, and the fluid accumulated rapidly. On admission she measured thirty-nine inches round the abdomen, and was forty-one prior to the operation. She had lost much flesh, and could with difficulty walk upstairs. Menstruation was normal.

The operation of ovariotomy was performed on the 14th June, by Dr. Atthill, Master of the hospital. Ether was the anæsthetic employed, administered by Mr. Ormsby, who used his inhaler; the cyst was unilocular, with slight adhesions anteriorly; it contained twenty pints of a dark, gluey liquid, sp. g. 1,030. It was emptied without its contents escaping into the abdomen.

The pedicle was secured by means of Spencer Wells' clamp. The cut surface brushed over with the actual cautery, and the external wound brought together by means of five carbolised cat-gut sutures. The operation was concluded in twenty-five minutes. The patient vomited a little just as the operation commenced, but not afterwards. Temperature of room was maintained at 70° F.

June 14th.—(After operation) 10·30 a.m.—Temp. 97·6 (in axilla); pulse 100; resp. 24. Vomited twice during the day. Slept a good deal. Diet: milk and soda water, with ice *ad. lib.*

7.30 p.m.—Temp. 101; pulse 110; resp. 26.

15th.—9·30 a.m. Temp. 100·4; pulse 115; resp. 30. Passed a quiet night; vomited only twice; tongue moist, coated with a white fur; urine drawn off every four hours with a catheterr Ice, milk, and soda water, as before.

7.30 p.m.—Temp. 101·2; pulse 124; resp. 30.

16th.—Temp. 99·6; pulse 110; resp. 32. Passed a restless night, being troubled with a distressing cough, which induced vomiting. No abdominal tenderness. Ordered: ℞ Sodæ bicarb, ℥ij.; acid hydrocyan dil m 24; Aquæ ad ℥viij. st. ℥i. Notwithstanding, she vomited frequently during the day; the bowels also repeatedly acted. Ordered: gr. ¼ morphia hypodermically.

Evening.—Temp. 100·6; pulse 135; resp. 32.

17th.—Temp. 100·6; pulse 120; resp. 32. Slept well. Had no vomiting or diarrhœa; but has a painful, kneading sensation in bowels. ℞ Enema amylic cum tinct. opii m x. Two sutures removed. Wound healthy; dressed with carbolic lotion. Given beef-tea in half-ounce doses every hour.

Evening.—Temp. 99·6; pulse 99; resp. 22.

18th.—Temp. 98·4; pulse 99; resp. 22. Feels quite well. From this date she progressed rapidly until the 23rd, when a liquid diarrhœa set in, with fullness in the right groin. Temperature was normal. Astringents were tried, but they gave only a temporary relief; large enemata of water administered, which brought away an accumulation of fæces, which was the cause of the irritation.

July 5.—Convalescent.

THE PHYSIOLOGY OF SUGAR IN RELATION TO THE BLOOD.—No. II. (*a*)

By F. W. Pavy, M.D., F.R.C.P., F.R.S.,
Physician and Lecturer on Physiology, Guy's Hospital, &c.

Amount of Sugar contained in the Blood.

This paper formed the continuation of a previous one read on the 14th ult. (see Medical Press and Circular, July 4th), in which the author described in detail his new gravimetric process for the accurate determination of sugar in blood. The present communication is the issue of the application of that process.

Dr. Pavy dealt with the question of the quantity of sugar in the system under the following conditions:—

1. The amount which exists in blood in its normal condition.
2. The comparative state of arterial and venous blood.
3. The spontaneous change which takes place in blood after its removal from the system.

The author pointed out that the very rapid changes which take place in blood under altered conditions of the system render it essentially necessary that the greatest precaution should be observed, in order to obtain blood in its natural condition. If taken during life, the animal should be in a perfectly tranquil state. If after, it should be procured as instantaneously as possible after the death of the animal, so that no opportunity could be afforded for the blood to be affected by the post-mortem production of sugar in the liver.

The experiments now under notice were made on dogs, sheep, and bullocks' blood, and a series of six—in one case, seven—examinations of each kind instituted, and two analyses made for every sample taken.

In quoting Dr. Pavy's figures, we are giving the mean of the two separate analyses. It is necessary, however, to state that the extremes of each show but trifling variations, and these are rarely so great as to affect more than the second figure in decimals. The differences were so slight indeed, that, had the results been obtained by rival analysts, no dispute could have arisen, as the variations were within the recognised range.

The mean results of seven examinations of dogs' blood showed the amount of sugar which it contained, in parts per 1,000, to be as follows:—0·751, 0·786, 0·700, 0·766, 0·786, 0·921, 0·803, respectively. This gives an average of 0·787 on the whole series.

The blood of sheep yielded 0·470, 0·490, 0·517, 0·559,

(*a*) Abstract of Paper read before the Royal Society, June 21st.

0·569, 0·526, respectively, or an average of 0 521 parts of sugar per 1,000.

The bullocks' blood gave 0·703, 0·525, 0·492, 0·456, 0·499, 0·588, or an average of 0·543.

In each of these experiments every care was taken to secure the blood in such a manner that it was a reliable representation of its ordinary condition during life. Unless such precautions are taken, the results obtained will be, in a physiological point of view, worthless and misleading.

This fact was strikingly illustrated by a comparison of results which Dr. Pavy obtained from four bullocks killed in the ordinary way—viz., by felling the animal with a poleaxe, and breaking up the spinal cord by means of a cane. In the first two of these observations the opening into the blood-vessels was made as speedily as possible after the animal had been felled. In the next two, Dr. Pavy had reason to believe that this necessary condition had not been complied with, and that some little time was allowed to elapse between the felling of the bullock and the opening of the vessels. The effect of this delay in the post-mortem production of sugar is shown by the following results :—

Blood of the first two bullocks (mean of two analyses) yielded 0·596, 0·688 parts of sugar per 1,000, respectively. In the second two a mean of 1·053 and 1·094 parts of sugar per 1,000 were given.

The conclusions to be drawn from these varying experiments are, that the amount of sugar contained in the blood of sheep and bullocks is about ½ per 1,000, or 1 in 2,000, and in a dog about ¾ per 1,000, or 1½ per 2,000. Taking the results of the whole series of observations, they show a remarkable uniformity and harmony in the amount of sugar contained in the blood of the respective animals.

In striking contrast to this uniformity and consistency of the results attained by Dr. Pavy are the figures given by Bernard, who states (in *Comptes Rendus*, June 19th, 1876, p. 1,409) that the lowest limit of sugar in the blood is 1 per 1,000, and that in the normal state the amount of sugar varies from 1 to 3 per 1,000.

Comparative State of Venous and Arterial Blood.

The author next considered the comparative states of the arterial and venous blood. This part of the subject is one which possesses the greatest importance from a physiological point of view.

One of the effects of anæsthetics on animals is to occasion an abnormal amount of sugar in the blood. In order to attain accuracy, therefore, it is indispensable that blood should be taken at a time when the animal is not under such influence.

In the first observation made on the blood of a dog, life had been instantaneously destroyed by pithing, and collections were made immediately after from the jugular vein and crural artery. No time was allowed for the effect of post-mortem formatio i of sugar in the liver to influence the blood. The results obtained by this method were as follow : Crural artery, ·799, ·799 ; mean, ·795. Jugular vein, ·793, ·791 ; mean, ·792.

In order, however, to obtain evidence to which no exception could be taken, Dr. Pavy adopted another method of procedure, which he was enabled to do just prior to the meeting of the society, from having a restriction previously imposed under the Vivisection Act removed. This enabled him to collect the blood under the natural conditions both from the carotid artery and the jugular vein. The animals operated upon were placed under an anæsthetic, during which time the vessels were exposed and a thread placed loosely round each. After they had regained tranquillity, and the effect of the anæsthetic passed off, the vessels were drawn forward, and openings made into them to allow of the simultaneous escape of blood. So quietly and painlessly was this operation of collection performed, that the animals themselves maaifested no signs of consciousness of what was taking place. The analyses of the blood obtained in this manner were commenced before coagulation had time to occur, and the results were as follow : No. 1, carotid artery, ·806, ·817 ; mean, ·811. Jugular vein, ·808, ·788 ; mean, ·798. No. 2, carotid artery, ·854, ·873 ; mean, ·863. Jugular vein, ·863, ·896 ; mean, ·879.

From these figures it is clearly evident that no material difference exists in the amount of sugar contained in arterial and venous blood.

The mean of these several observations show an apparent difference between arterial and venous blood of ·300 parts of sugar per 1,000. The least difference stands in an observation in which the figures are 1·100 parts per 1,000 for arterial, and 1·080 for venous, showing a variation of ·020. The greatest difference is in an observation where the figures stand 1·510 for arterial and ·950 for venous. This comparison relates to the carotid artery and jugular vein, and the difference amounts to ·560 parts per 1,000, which represents actually altogether a large proportion of sugar than Dr. Pavy has found exists naturally in the blood of the sheep and the bullock.

Spontaneous Disappearance of Sugar from Blood.

Turning to the third part of his subject—viz., the spontaneous disappearance of sugar from blood after its removal from the system, Dr. Pavy gave the results of a series of analyses he had conducted, and which are as follows :—

No. 1.	Taken immediately after death	mean	·786
	„ after 1 hour.....	„	·739
No. 2.	Taken immediately after death	„	·700
	„ after 1 hour.....	„	·670
No. 3.	Taken immediately after death	„	·766
	„ after 1 hour.....	„	·751
	„ „ 23 hours.....	„	·285
No. 4.	Taken immediately after death	„	·786
	„ after 1 hour.....	„	·728
	„ „ 24 hours.....	„	·302
No. 5.	Taken immediately after death	„	·921
	„ after 1¾ hours.....	„	·793

A somewhat parallel series of experiments made by Bernard, and published in *Comptes Rendus*, June 10th, 1876, showing a remarkable discrepancy with the foregoing.

In conclusion, the author stated that the evidence adduced in this communication shows that the results which Claude Bernard has obtained by the experimental *modus operandi* he has been recently employing are erroneous, and consequently the inferences he has drawn from them are equally in error. The cause of truth and the interests of science demand that what he has recently been advancing should be eliminated from physiological literature.

ABSTRACT OF
CLINICAL LECTURES ON SYPHILIS.

By S. Messenger Bradley, F.R.C.S.,

Surgeon to the Manchester Royal Infirmary, and Lecturer on Practical Surgery, Owen's College.

Lecture II.—*Period of Secondary Affections—Multiple Inguinal Adenopathy—Syphilitic Fever—Affections of Skin — Mucous Membrane — Hair—Nails—Bones and Periosteum—Blood-vessels—Nerves—Organs of Special Sense—Viscera.*

Multiple Inguinal Adenopathy.—When the syphilitic virus has advanced beyond the first inguinal gland to the glands next in order contamination of the general system may be regarded as tolerably certain, and the circumstance itself be looked upon as the first evidence of constitutional infection, or the first secondary symptom. It is true that in a few cases no such result has followed a hardening and enlargement, apparently syphilitic, of the entire chain of glands, that

in certain other rare instances secondary affections have ensued when only one gland was attacked, and, again, others when a general syphilitic eruption has been seen without any previous glandular affection; in, however, the vast majority of cases of constitutional syphilis a hardening and enlargement of the whole chain, or "constellation" of inguinal glands takes place prior to the outburst of other more general symptoms. This multiple inguinal adenopathy is of a characteristic kind; the glands are neither very large nor very tender, nor do they ever suppurate except under accidental and quite additional irritation, but each gland slowly and almost painlessly enlarges, becoming very hard, about the size of a filbert, and often remaining perceptibly larger than those on the opposite side for months and years; it is almost always prior to the subsidence of the adenitis that secondary affections of the skin and mucous membrane manifest themselves. This class of symptoms is more closely ushered in, however, by an attack of syphilitic fever, to which we now allude. (*a*)

Syphilitic Fever.—At a period varying considerably in duration, but with an average of sixty-seven days from the date of infection, and, therefore, of about forty-six after the appearance of the initial lesion, secondary symptoms are ushered in by an attack of syphilitic fever. Like most syphilitic phenomena, this presents great diversity of type, at times passing by quite unnoticed, at others constituting in itself a sharp illness, while most frequently it produces a general feeling of *malaise*, of being "out of sorts," without any marked individuality of type. In the general run of cases the symptoms are headache, limb weariness, anorexia, a temperature raised at night, and depression of spirits. These symptoms pass away in a day or two, but before doing so, or immediately after, usher in the train of secondary affections of skin, &c.

These we now proceed to consider, and for the sake of convenience shall consider them histologically in the following order: affections of skin, mucous membrane, hair, nails, bones and periosteum, blood-vessels, nerves, organs of special sense, and the different viscera. It must, indeed, be distinctly understood that secondary syphilis, which is the period of the greatest inflammatory activity of the syphilitic poison, spares no tissue or viscus, and that, therefore, no distinction can be made on this ground between secondary and tertiary manifestations; the real difference between the two depending, as we shall see later, in quite other circumstances—viz., in the fact that the tertiary period is distinguished by a peculiar exudation, and not at all in the supposed circumstance that tertiary syphilis affects the bones and viscera, while secondary syphilis limits its ravages to the cutaneous and mucous surfaces.

Secondary Affections of the Skin.—It may be mentioned *in limine*, that while there is no distinctively syphilitic skin disease, yet syphilis impresses its mark upon every cutaneous affection of which it is the *vera causa*. Some skin diseases are much commoner than others, though nearly every form is occasionally met with as the offspring of the virus. Erythematæ, papulæ, and squamæ are more frequently encountered than vesiculæ bullæ, or pustulæ. Some, again, such as roseola, are common as early secondary symptoms, while others, such as psoriasis, are more decidedly characteristic of the later periods of the secondary rash. There are certain features which syphilitic skin diseases, conveniently grouped together as "syphilides," possess in common, and which serve to distinguish them from their non-specific allies. They are coppery, or inclinning to copper, in colour; passing away, they leave a brown stain behind them, which finally fades into yellow, and is sometimes persistent; they are not accompanied by pyrexia if the syphilitic fever has passed, they often appear very suddenly, they are prone to recur after disappearance, they are not associated with any itching sensation; if papular, the papules are round and smooth and shining; if squamous, the scales are very fine and small; if pustular, the crusts are prone to accumulate in a superimposed fashion, simulating the appearance of a limpet-shell; if ulcerative, the residual ulcer is circular, with remarkably clean-cut edges.

The pathological anatomy of syphilitic skin diseases does not differ from that of non-specific origin, but the affections are often characterised by a diversity of type which is not common under other conditions; thus we not unfrequently find papulæ, squamæ, and maculæ existing side by side in syphilitic skin diseases.

Roseola indicates a mild attack, and is the commonest of all specific secondary skin diseases. It chiefly affects the chest, abdomen, and face; the patches are sometimes red when the capillary activity is great, at others, coppery from the onset; they form clusters, and the spots vary in size from small points to marks as large as a shilling; they readily yield to treatment, but are prone to recur. A word of caution should be given the student against mistaking chloasma (tinea versicolor) for roseola or other maculæ. I am led to say this from often meeting with cases where the patient quotes the *verbum magestri* in support of this error. The greenish-yellow tinge of the patch of tinea should at once suggest its true nature, and in cases of doubt the detection of spores under the microscope will settle the question.

Papules, large and smooth in outline, is, in my experience, the form of skin disease next in frequency to the maculæ. They have no special name, and may be regarded as perhaps the most distinctively syphilitic of all skin affections. They chiefly attack the chest and face and shoulders; they are about the size of a threepenny-piece, raised some two lines from the surface; they are smooth and shining, with a coppery hue. They indicate a much more serious invasion of the system than roseola does, and though they yield readily enough to treatment, they are very generally followed by other syphilides, or themselves recur.

Psoriasis, rare on some parts of the Continent, is very common in England. The flexor surfaces of the arms and hands, the soles of the feet, the face, the tongue, and trunk are situations frequently selected by this disease. Psoriasis strictly confined to the palms of the hands and the soles of the feet is nearly invariably syphilitic in origin, and in type is quite characteristic; after a time it becomes limited to the "lines of life," or creases of the fingers and palm, picking them out with a glazed red line, easily seen, and not readily mistaken for anything else. Syphilitic psoriasis is a true squama from the first, and not a late form of vesicula; the scales are exceedingly small and fine, and in many cases almost imperceptible. The affection is characterised by a marked tendency to crack, the resulting fissures often being painful. Psoriasis, and especially palmar psoriasis, indicates an obstinate, though not necessarily virulent form of the malady, and years often elapse before the tendency to recurrence is overcome.

Rupia and *Ecthyma*, the latter being often sequential to the former, are neither of them very common; they more frequently follow a phagedænic chancre than any other form of primary lesion, and, as a rule, point to a cachectic habit of body. The crusts of rupia sometimes attain a considerable height before falling, and the ecthymatous ulcers often eat very deep. The forehead, arms, and legs are the commonest situations of these affections, both of which indicate a severe attack of syphilis. The stains left by both are often persistent through life.

Vesicular and *bullous* syphilides are rare, and are generally sequential to an obstinate form of primary lesion. They do not present any feature calling for special attention.

Secondary Affections of Mucous Membranes.—Almost equally common with cutaneous affections are syphilitic

(*a*) Though the inguinal glands are the first recipients of the poison, and therefore the first to suffer, they are not the only glands affected, but are often followed by enlargement of the posterior cervical glands, and less frequently by glandular enlargement elsewhere, *e.g.*, in the axilla or the ham.

affections of the mucous membrane; especially is this the case with the mucous membrane of the mouth and throat. The most frequent form it assumes is ulceration of the tonsils; this is probably due to the circumstances, as we shall see on discussing the pathology of the disease, that the tonsils are congeries of lymphatics, which are the special conduits of the poison. The affection we are speaking of often comes on very suddenly, and is decidedly painful. The ulcers are clean-cut, with a tendency to circularity; they are symmetrical, and are distinguishable from other ulcerative diseases of the throat by being unpreceded by any tonsillar hypertrophy, and presuming the syphilitic fever has passed over, being unaccompanied by pyrexia. Care must be taken not to mistake the fore edges of the faucial pillars for the margins of an ulcer, for occasionally it happens that the free edge of the palate-glossus, when surrounded by inflammatory action, closely simulates this lesion. In doubtful cases the history of the primary lesion is of great value. Somewhat later in the career of syphilis (for the throat affection is generally cotemporaneous with the earlier skin symptoms, often disappearing and reappearing as the cutaneous affection fades and recurs) we meet with mucous *plagues*, or *tubercles* (condylomata), or *rhagades*. The *plagues* chiefly affect the tongue, and are best seen when the surface of the organ is cleaned and dried with blotting-paper; then the circular, red, glazed patch becomes sharply defined and easily distinguished from the surrounding papillary glossal structures. On the tonsils round, smooth, *tubercles* (condylomata) of the size of shirt-studs are very frequently met with, and these *condylomata* again are often found during the progress of the disease on the vulvæ, or the anus, or perinæum, or buttocks, or nose, or toes, or face, or neck. *Rhagades* of the tongue are exceedingly common, and somewhat less so are rhagades of the anus. These rhagades often fissure the entire circumference of the tongue, nicking it as with a knife all round; healing, they leave cicatrices behind them, which become a valuable index of a past attack of syphilis. This tendency to cicatrisation forms a notable feature in syphilis, and is the cause of a somewhat common and always very important secondary lesion: I refer to *stricture of the rectum*. The stricture is generally situated within easy reach of the finger, and is sequential, I believe, to ulceration of the mucous membrane. It not only is an inconvenient and even perilous disease in itself, but is apt to give rise to fistula in ano, which must thus be looked upon as a disease of occasionally syphilitic origin. (*a*)

Secondary Affections of Hair.—Alopecia is an ordinary mark of secondary syphilis—the fall of hair being sometimes associated with a distinct eruption about the hair follicles; at other times no eruption being discernible. The occurrence of this lesion varies greatly in time being occasionally one of the first evidences of constitutional infection, at others, years elapsing before it makes its appearance.

Secondary Affections of Nails.—The nails are often affected by syphilis, and are sometimes the only seat of the poison. The ungual affection at times is manifested by deep transverse furrows, the entire nail being dry and chippy, and readily breaking at the fore edge; at other times a true onychia of an obstinate and painful character is the form which the disease assumes.

Periosteum and Bones.—Both the bones and their periosteal investment are often invaded during the later stages of secondary syphilis. In both cases inflammation (periostitis or ostitis, as the case may be) is produced, and in both the tendency is to a circumscribed form of inflammation. In case of the periosteum being attacked effusion takes place beneath it, raising it into a lump or *node*, which either hardens more and more until it ossifies, or undergoes a more or less complete resolution; in case of the bone being the site of mischief, the inflammation produces either a *sclerosis* or *necrosis* as the inflammatory action is more or less severe. The bones most frequently attacked are the os frontis, the tibiæ, the clavicles, the sternum, the radius, and the ulna. If treatment be adopted resolution may very generally be counted on, but in a few isolated cases suppuration ensues, which may give rise in its turn either to a general death of the bone or to pyæmia.

Blood-vessels.—In no class of affections is the destructive power of syphilis greater than in this group; in no class is it less seen and more felt; giving rise to few or no active symptoms an arterial lesion often exists which suddenly announces itself by the rupture or the dilatation of the vessel affected, hæmorrhage (probably cerebral), or an aneurismal tumour, as the case may be, being the result. The influence of syphilis upon the veins is less, indeed, is little understood; but, doubtless, it is here as elsewhere potent for mischief, and in all probability a syphilitic phlebitis is a common precursor of the syphilitic ulceration of the legs which we so often see. The action of the poison upon the arterial system has been carefully studied; in the first place, it gives rise to a localised arteritis, and the exudation being absorbed, an atheromatous patch is left, which so weakens the vessel as to determine either its rupture or its yielding. It is probably not too much to affirm that fifty per cent. of all cases of aneurism met with in adult life are due to the poison of syphilis.

Nervous System.—Syphilitic neuritis is occasionally met with, but more commonly we have to deal with a cephalic or sciatic neuralgia whose specific origin is sufficiently demonstrated by its rapid subsidence under the use of iodide of potassium. General nervousness is another condition which the presence of the syphilitic poison in the nervous system produces; it may be indirectly caused by an impaired nutrition of the blood, but whatever the explanation be, the phenomenon itself must not be overlooked. I have over and over again met with cases of nervous agitative tremor which, while resisting other methods, have readily and completely yielded to antisyphilitic treatment. Small tumours, akin to the painful subcutaneous tumours of Wood, sometimes form upon the sheath of nerves, which, disappearing under the exhibition of iodide of potassium, are presumably of syphilitic origin; histologically, they are akin to fibromata.

Organs of Senses—the Eye and Ear.—Both these organs are liable to the invasion of syphilis; the eye, however, much more frequently than the ear. Any of the tunics, the sclerotic, choroid, or iris, or the retina, may become affected, a sclerotitis, choroiditis, iritis, or retinitis ensuing; of these, iritis is more common than all the others put together. The diagnosis between these affections and their non-specific allies is determined, and can only be determined by the history, and, therefore, needs no detailed description here. (*a*)

The ear may suffer too in all its parts, but affections of the tympanic cavity are the commonest and most important. Syphilitic otitis often results in rupture of the membrana tympani and escape of the ossicles through the rent—in consequence of which partial or complete deafness is caused. In the meatus, condylomata or syphilitic papillomata are likely to attract attention, but do not differ from similar affections elsewhere.

The Viscera.—The viscera, and more particularly the outer coats and investing membranes of the viscera,

(*a*) Among the most important syphilitic affections of mucous surfaces must be ranked syphilitic laryngitis. This disease comes on during the progress of the accompanying syphilid; it runs a slow course, and whether the affection be syphilitic erythema or ulceration, almost always terminates favourably, and so notably contrasts with the tertiary affections of this organ. The most prominent symptom is hoarseness or loss of voice.

(*a*) The nodular character which the lymph assumes in syphilitic iritis, the presence of little tubercles or condylomata, and the coppery tinge of the iris, are all symptoms of doubtful existence, and certainly of less value than the history of the particular case.

are liable to the inroads of secondary syphilis. The presence of the poison produces symptoms of an inflammatory nature, which are more or less acute as the viscus itself, or its coating, is the seat of mischief. If the former be attacked then the functions of the organ are likely to be deranged, or abrogated, and this often forms the only clue we have to the existence of disease, *e.g.*, in the liver we may have icterus produced ; in the kidneys, albuminuria ; in the spleen, a leucocythæmic state ; in the brain, headache and mental confusion ; in the lungs, bronchitis ; or it may be that the syphilitic lymph undergoes a process of organisation, when a cirrhotic condition will be induced. When the testicles are affected by secondary syphilis the epididymus is the part to suffer first, though afterwards the body of the organ participates ; the symptoms are less acute than in gonorrhœal orchitis, and the progress of the case more slow ; the organ rarely attains a very large size, but is hard and slightly tender.

All these visceral affections yield more or less readily to treatment. As to diagnosis, there are no pathognomonic symptoms which differentiates them from maladies of a non-specific origin, and, therefore, the history of the case, the presence of other syphilides, and the subsidence of symptoms under the employment of anti-syphilitic remedies are the chief grounds on which we base our opinions. At the same time it is important that the student should recognise the existence of these visceral and meningeal affections among the phenomena of secondary syphilis, inasmuch as some are too ready to attribute all visceral affections of a syphilitic nature to the later period of gummy products. As we shall see in the next lecture, though certainly more common as tertiary symptoms, syphilitic visceral affections naturally differ in the two stages of the disease.

Clinical Records.

THE ASPIRATOR IN STRICTURE OF URETHRA.

By P. L. O'Neill,
Surgeon to Union Infirmary, Athy.

June 20th.—J. F., æt. 62, presented himself to Dr. Mara at the dispensary, labouring under a fit of retention from which neither the doctor's tact nor patience in the use of the catheter relieved him. Accordingly he was admitted to the infirmary, where I also essayed in vain in same way. However, under the use of a hot bath and opiate suppository the urgency abated. Next day I again endeavoured to pass a catheter, but with the same result. The bladder being greatly distended and patient's sufferings intense, I with Dr. Mara's assistance aspirated it. In twenty minutes after the operation, I introduced a No. 1 catheter with the greatest ease. I have since, by degrees, introduced larger, and patient is happily progressing.

There are few hospital surgeons who have not from time to time met cases where the instrument could not be introduced while the bladder was distended, and yet found it pass easily after that viscus had been evacuated.

Holmes, in his "Principles and Practice of Surgery," recently published, states, in reference to aspiratory puncture of the bladder for retention in stricture of urethra, that he is somewhat sceptical as to its real value, but at the same time acknowledges that its use is perfectly rational. I think in this particular instance the real value of the aspirator has been fully established.

The death-rate in London last week was only 19 per 1,000 of its population. Glasgow in the same period shows 21, Edinburgh 23, and Dublin 31, during the past week. Of the large towns in the second category, Portsmouth returns only 11 per 1,000, and Oldham 29, the two marking the extreme boundaries of the mortality of the week.

Correspondence.

PRIVATE LUNATIC ASYLUMS AND PRIVATE PATIENTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I regret that I cannot accept the conclusions of Dr. Forbes Winslow, "that the present system of our lunacy practice works well, and is a sufficient protection against improper incarceration," though they are the opinions of one whose words are entitled to respect from his long connection and acquaintance with questions of insanity.

I am not singular in my views, as I find it stated in the *Lancet*, of May 12, p. 691, "that the whole subject of lunacy is open for investigation and calls for scrutiny." Does not the very existence of a select committee point *primâ facie* to some dissatisfaction with the existing system? Why should Dr. Lockhart Robertson—if there is sufficient protection at present—recommend to the Select Committee on the Lunacy Laws the appointment by the commissioners of a visiting physician to every private asylum, on the ground that such appointment would be a great safeguard against undue detention and improper treatment? (*Brit. Med. Journ.*, May 26, 1877.) Can our lunacy laws be considered perfect, or to work well, when the existing law (8 & 9 Vic., sec. 100, c. 57) requires only a resident medical man for asylums which contain 100 patients, or even more ; and in the 104 private asylums of England and Wales the law requires a resident medical man in only seven, the daily visits of a medical man in only nine, and in the remaining 88 asylums it will be satisfied with the visit of a medical man twice a week (*Brit. Med. Journ.*, May 26, 1877). Can we say in the face of such facts that our lunacy system works well or is satisfactory? It is true that the Commissioners in Lunacy, whose disinterestedness, humanity, and devotion are known and appreciated, visit these institutions six times a year ; but however diligent and expert they may be, such periodical visits do not afford a sufficient safeguard against improper incarceration.

I grant that Dr. Forbes Winslow's experience has been happy, and in thinking of such private asylums as he has been connected with, "the mind naturally reverts to some well-known institution ignoring the far greater number of obscure places, 29 of which are licensed to non-medical persons, 20 to women," and "not more than 25 can, upon the most liberal computation, be said to be licensed to medical men whose names are not much known beyond the precincts of their own walls" *Brit. Med. Journ., loc. cit.*).

As a further instance of the difference of opinion on the lunacy laws, I give another extract from the *Lancet*, May 12, p. 670 :—"The select committee has been told, on high authority, that no case of unjustified incarceration, or undue detention in an asylum has occurred for many years past, that the treatment patients receive is excellent, and, in fact, nothing remains to be desired. On what should be equally trustworthy testimony it has been asserted that something like a third of the inmates of private asylums are not insane, that drugs are administered wilfully or carelessly to their permanent detriment, and that a radical change is urgently necessary."

So much for the general question of the excellence of our present system, and I must leave your readers to draw their own conclusions from the quotations I have given.

I certainly cannot see any harm in discussing such questions as the above, even though the committee have not finished their inquiry ; the more they are ventilated the more light must be thrown upon them, and the experience and opinions of various minds are brought forth, some, perhaps, being worthy of attention, others erroneous. Neither am I inclined to alter my views by Dr. Forbes Winslow's reasoning in reference to lunacy certificates.

I am aware the Commissioners in Lunacy receive such and examine them, and all informalities and mistakes as to exact name, date, signature, place of residence, &c., are very soon noticed, whilst forms are returned for alteration or amendment where insufficient evidence is given, and I believe, as a rule such additional evidence is generally forthcoming.

But what protection is afforded by the Commissioners when they receive two duly attested certificates with, *on paper*, sufficient facts, and all their laws complied with? They necessarily accept them on the faith of the two signatures,

and decide on the facts before them; but if they made a personal examination themselves they might, in some instances, hesitate before they pronounced their verdict of satisfactory. Every system has its abuses, but our object and desire is to remedy such, and to make our lunacy practice so perfect "that cases may *not* be cited in which certificates have been given apparently in a careless or improper manner." I shall look forward with interest to Dr. Winslow's report on "Private Asylums."

A long letter is a great evil, and though I have not half entered into the question, I must conclude, as I do not desire to weary your readers or take up space which may be required by other subjects equal in importance to that which has been started by

Yours faithfully,

July 6, 1877. HUMANITARIAN.

"THE HOMŒOPATHIC SCHISM."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In an article entitled "The Homœopathic Schism," which appears in your paper of the 4th inst., you (by omitting three words from a sentence quoted from the leading article in the *Homœopathic Review* for the current month) expose the meaning of the writer of that article to grave misinterpretation. We trust that you will allow us to correct the possibility of such interpretation being put upon it. You write: "Hahnemann is now dethroned from his position as the leader of homœopathy, and we are assured by the monthly *Homœopathic Review* for July 'there are few who have any belief at all in those teachings of Hahnemann which are constantly paraded as true homœopathy.'" In the original this reads, "those teachings of Hahnemann which are constantly paraded *by our adversaries* as true homœopathy." We maintain that the idea of an increment of medicinal power being produced by prolonged perturbation, that the opinion that the best dose in all cases is a globule of the thirtieth dilution, and the theory that a large proportion of chronic diseases originate in a suppressed eruption, have nothing whatever to do with homœopathy.

These views, whether erroneous or sound, are separate and distinct from it. They form pharmaceutic, therapeutic, and pathological ideas propounded by Hahnemann, which have been more or less contested, and by many who avowed their confidence in homœopathy were repudiated, from the earliest period of their enunciation.

Hahnemann undergoes no dethronement by any denial of the truth of these teachings of his. His reputation rests, for the most part, on his having been the first to work out the law of similars, and to show its great importance in therapeutics; in his having been the first to institute, on a large scale, investigations into the action of drugs, by experiments on healthy men and women; on his recognition, forty years in advance of the bulk of the profession, of the detrimental character of the violent methods of dealing with disease prevalent in his time; and in his having substantiated the efficacy of very small doses of drugs in curing disease, *when such drugs were administered in harmony with the principle of drug selection he was the first to elaborate.*

We are, sir, yours, &c.,

EDITORS OF THE "HOMŒOPATHIC REVIEW."

London, July 6th, 1877.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—With reference to the observations on this subject in your impression of the 4th instant, will you permit me, as the originator of the present movement in favour of peace between contending medical schools, briefly to repeat that Hippocrates 2,400 years ago, said *some diseases were best treated by similars and some by contraries.*

This axiom has never been seriously disputed by the great body of the profession, nor has the belief in this axiom ever been injurious to the professional position of any man.

Orthodox medicine has mainly interested itself in developing the law of contraries, while the so-called homœopathists have most laboriously devoted themselves to developing the law of similars. The two systems are thus the two factors of the Hippocratic axiom.

At the present day those who have hitherto acted almost exclusively on the law of contraries, are beginning to employ a considerable number of remedies long in use according to the law of similars, and, on the other hand, the more advanced and less sectarian of the homœopathists have always used many remedies outside the law of similars, and some remedies according to contraries.

The question I ask is simply this:—Why should these two schools expend their energies in denouncing or ridiculing each other? Why not meet, as scientific and honest men, desiring beyond all things peace and truth, and quietly and like men of common sense, reason the matter out. No system is so perfect as to be incapable of improvement, and no system is so bad as to contain no good.

Will you not assist in bringing about a true understanding on the basis of mutual regard and respect.

Yours sincerely,

GEORGE WYLD, M.D.

12 Great Cumberland Place, W., July 8, 1877.

HOW IS QUACKERY TO BE REMEDIED?

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Although I shall not presume to answer the question you have raised in your able leading article on quackery and its remedy, perhaps you will allow me to make a few remarks on a subject to which you have very properly called the attention of the profession.

And first let me endorse all you have said respecting the laudable object and good work of the Medical Defence Association, and the duties and opportunities of that large class of practitioners which forms the rank and file of the profession. A great deal of credit is due to this Association for the spirit and zeal they have shown in grappling with an evil from which much older and more important bodies have shrunk, and it is to be hoped that they will meet with even more patronage and encouragement than they have hitherto secured.

If we speak of medical quackery in the largest acceptation of that term, I am afraid it will be long before your question receives a satisfactory answer. Quackery has flourished from time immemorial. It is mentioned in the Hippocratic writings; and you will even find it noticed in those Sanskrit works of the ancient Indians, which date further back than the time of Hippocrates. The credulity of mankind, ignorance, the objections which all Governments have to interfere too much with the liberty of the subject, and even the imperfection of medicine as a science and an art, are the conditions which help to foster quackery and imposture; and as a very long period must elapse before some of these conditions cease to operate, I fear there is very little prospect of putting an end to the evils of which you justly complain.

In your article, however, you allude chiefly to those forms of quackery which are respectively represented by prescribing chemists, unlicensed medical practitioners, and unqualified assistants.

With regard to chemists prescribing, I would urge that there are several ways in which this evil either is, or may be, kept down. In proportion to the diffusion of education among the masses, we may expect that the public will see it is to their interest to consult members of the profession, instead of chemists. The habit, too, which a certain class of medical men have of keeping open shops, and which leads the public to make very little distinction between the druggists' shop and the "open surgery," will be gradually given up, *pari passu*, with the entry into the profession of a more respectable and highly educated class of practitioners.

Then, with regard to unqualified assistants, the question is a very important one, but a very difficult one to deal with. I agree with you in thinking that by discountenancing this class of unqualified practitioners, we are really doing them a service, inasmuch as when they find they cannot get employment, they will have a strong incentive to pursue that course which alone enables them to be acknowledged by the profession. Perhaps the reforms that have been recently made in the preliminary education and examination of the student, will be the means of preventing men entering upon their medical studies who are never likely to pass their final examinations. A large number of unqualified assistants are men advanced in life, and who are allowed to commence their professional studies without having been tested as to their general education. Now the case is different, and men who have been compelled, as they now are, to pass a preliminary art-examination before they can be registered as medical students, have

much more chance of pursuing their subsequent studies with success.

I have trespassed so much upon your valuable space, that I must bring my letter to a close, but, perhaps, with your permission, I may on another occasion make some further remarks on the subject.

I am, &c.,
A General Practitioner.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The profession must be indebted to you for taking up this subject. It is a return to an old grievance, agitated by old journals. One reason why we have not been successful is, as stated by the Apothecaries' Company in their first letter to Sir James Graham:—"The attempt to put down illegal practice has never yet been fairly made."

Prosecutions are expensive, the defendant only is mulcted in £20, but the prosecution is mulcted in a very much heavier sum.

The Medical Defence Association must want funds. I trust the profession will support you and this Society.

Yours, &c.,
June 26th, 1877. Salfordiensis.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Thomas Carlyle objects to shams strongly; you do likewise, judging by your articles. The rank and file should feel obliged by your assigning them such an important place in physic, by putting trust in ourselves, and keeping our powder dry.

It is doubtful whether prosecutions alone, or stringent medical laws will suppress quackery.

Education of the public may do good, and teach them to distinguish the true from the false, when they are more Ruskinised and Carlylelised, if I may use such words.

I hope you will preach to the profession in "cannon salvoes," which may react on the public mind.

"Speech is silver, silence golden," but by all means let us have the silver at present, for it is wanted.

Yours faithfully,
June 30, 1877. A General Practitioner.

THE NON-ALCOHOLIC TREATMENT OF DISEASE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Having read both your leading article and Dr. Williams's letter respecting the London Temperance Hospital, I have pleasure in adding my testimony as to the value which an institution of this kind possesses for the purpose of scientific comparison of different methods of treatment.

Having had over quarter of a century of experience of the hydropathic system, in which alcoholic liquors are rarely used, I was not surprised at the good results which I had observed at the London Temperance Hospital in cases of the greatest severity. It is now many years since I witnessed the failure of the great Mr. Cusack to preserve life in a case of aneurism, for which he tied one of the common carotid arteries, death having taken place at the end of a few days from hæmorrhage. But I find that my friend Dr. Edmunds has been successful in a similar case, and I have seen a case of typhoid fever, which is now in the hospital, and is doing well, on the non-alcoholic system. Not being myself an abstainer, I may be regarded as perfectly impartial in what I now say: and I have no manner of doubt that those who wish to satisfy themselves of the large class of cases which actually do better without alcohol than with it, can easily do so at the London Temperance Hospital, where inquirers invariably receive every courtesy from the resident or visiting staff.

With regard to the difficulty which is often felt of finding a substitute for alcohol in cases where a tendency to intemperance exists, it is plain that when this can be done, much is gained in every way; and there is no reason to believe that any drug in existence (however valuable) is without its analogues, whose physiological properties are in many respects equally available. Under these circumstances, even those who believe in the virtues of alcohol, may regard the experiment now being made at the London Temperance Hospital, not only without "humiliation," but with the greatest satisfaction, as showing that the resources of medicine are by no means dependant upon any individual drug, or even upon any special class of remedies.

I am, Sir, your obedient servant,
Edwd. Haughton, B.A., M.D., M.R.C.S.E.

PAUPER (?) ATTENDANCE AND FEES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Will you kindly oblige by giving me your opinion of the following case, which happened to me a week ago. A labouring man was run over by a waggon, and received a fracture of the thigh, besides other injuries. A medical man was sent for, but as he did not see any chance of being paid for his trouble, advised the district medical officer being sent for, and volunteered to call and send him on his way home. I am the district medical attendant, and upon being asked by my brother practitioner to go, I went; but before going called on the relieving officer, and explained the case to him. He informed me he could not give an order, except on the application of one of his friends; but knowing the man, and his circumstances, he had no doubt he would come directly upon the parish. I went and attended to him, and as he was four miles from home, I placed his leg in splints, &c., and put him in a cart on a bed, and sent him home; requesting his brother to go to my surgery to fetch medicine, &c., and also get an order for the parish surgeon, which he did. I went again next morning, as I had the relieving officer's order to attend to him, the man living seven miles from my home, and to my great astonishment found my splints were all taken off, and a labouring man who resides in a neighbouring village, and *calls himself a bone-setter*, had been sent for by some of his friends, and as he said, set the limb. At the same time they wished me to attend him medically, which I declined; I immediately walked out of the house and left him. I consulted the relieving officer about the case, and he said he thought I ought to go and see the man again, and then report the case to the board, which I did. In consequence of such treatment to me, I hear the man is now very bad, and no medical man will go near him. Can I under these circumstances obtain my full extra fee of three pounds from the guardians for attendance, &c.? By answering this question for me you will greatly oblige.

Yours, truly, H. S. W.

*** There can be no question that our correspondent is morally entitled to his full fee, but we fear the guardians, if so disposed, could dispute their legal responsibility for extra fees in this case.

Medico-Parliamentary Intelligence.

IMBECILE, LUNATIC, AND OTHER AFFLICTED PERSONS BILL.

In the House of Lords, on Thursday,

Lord O'Hagan, in moving the second reading of this Bill, observed that the Census Commissioners of 1851 recommended that some steps should be taken to improve the condition of the imbecile, lunatic, and other afflicted classes in Ireland, but nothing had hitherto been done to carry out that recommendation. In the year 1862 an Act was passed for the amelioration of the condition of these diseases in England, but Ireland was entirely excluded from the operation of that measure, and he submitted that the case of these unfortunates was deserving of full consideration.

Lord Stanley of Alderley did not think the noble and learned lord had made out a case for legislation, and he therefore hoped their lordships would not read the Bill a second time. He thought if the 9,000 odd lunatics were to be shut up, as proposed by the Bill, they would be worse off than they were at present. He knew from personal experience the great care which the people of Ireland took of their afflicted ones, or he should have less hesitation in opposing the Bill.

The Duke of Richmond and Gordon said there could be no doubt that the subject which had been brought

before the house by the noble and learned lord was one of great importance; but there were two reasons why he thought it would be inexpedient to press a division on the Bill at the present time. In the first place, the Government, fully alive to the magnitude and interest of the question, proposed to issue a commission to inquire thoroughly into the whole matter; and, in the second place, even if that were not the case, he did not think it would be advisable to embark upon a measure of this kind at so advanced a period of the session, more especially when it was remembered that there was a committee of the other house sitting at the present moment upon the whole of the lunacy laws of the country.

Lord O'Hagan said that after what had just fallen from the noble duke, he was willing to withdraw the Bill, which was accordingly done.

PUBLIC HEALTH (METROPOLIS) BILL.

In the House of Commons, on Thursday,

Mr. Sclater-Booth, in reply to Mr. J. Holms, stated that he had given directions for the preparation of a memorandum showing the clauses in the Public Health (Metropolis) Bill, which were substantially taken from Acts now in force in the metropolis; and also those which were altogether new. The Bill did not propose to give any of the controlling powers and authority now vested in the Secretary of State for the Home Department or Privy Council to the President of the Local Government Board. There was no modification of any of the powers hitherto possessed by the local authorities.

WEDNESDAY, JULY 11, 1877.

THE ARMY MEDICAL WARRANT.

We understand that a new warrant relating to the duties of medical officers under the new scheme will soon be published; and that its chief feature will be the unreserved transfer of the command in all military hospitals, and over all men of the Army Hospital Corps, to the medical officer, subject only to the military officer commanding the camp, or garrison, in which they serve.

In this revolutionary change we of course see the death-blow to regimentalism, and it is now for medical officers to look the situation in the face. We think it will assume an aspect somewhat on this wise.

The comradeship, comfort, and social advantages of a regiment are gone; the independence of an isolated charge which individualised each man's labour, and won for him either confidence or contempt, and which not unfrequently developed the valuable quality of self-reliance, is now merged in collective duty; the distinctions of rank have been abolished, so that the oldest executive officer is interchangeable for duty with the last joined candidate. Horse allowance has been stopped, exchanges done away with, and the future of every medical officer placed unrestrictedly in the hands of the medical department.

On the other hand, medical officers will now be thrown with those of their own service only; they will, while performing like duties, exercise command over each other, according to seniority, and will have complete control over the *materiel* and *personnel* of their hospitals. They will save the subscriptions which they hitherto paid to regimental institutions, and ought to be subject to less frequent moves from place to place.

We do not hesitate to admit that as unification is apparently inevitable, the securing of command to medical officers gives it a backbone which we thought was far distant, nor do we attempt to conceal the fact, that in undertaking the struggle by which it has been won, Sir William Muir has not courted the paths which lead to popularity and preference at the hands of the military authorities.

It is at the same time all the more disheartening that the strong will and indomitable perseverance which bore down so much opposition to attain his object, should direct the same qualities against his own department in such a trifling matter as exchanges, and that he should refuse to conciliate those who have suffered such loss and hardship in the recent alterations by so easy a concession.

If medical officers were to feel that the same hand, whose strength was hitherto shown in the rude demolition of all their cherished belongings, were in future to be raised in their support and championship, they would gather confidence out of the very violence by which they suffered.

THE DEBATE ON VACCINATION.

Many months ago, we remarked that probably it would not be long before the House of Commons would take into consideration the propriety or not of amending the Vaccination Laws, not with the intention of making vaccination less compulsory than it is at present, but with the view of modifying the penalties that are now imposed upon those who infringe the Acts.

Both the amended motion and the debate which followed raised two questions for consideration, first, whether the practice of vaccination could be conducted in a more satisfactory manner, and secondly, whether the law relating to the accumulation or repetition of penalties, does not require amendment.

In reference to the first question, Earl Percy spoke in a remarkably temperate manner, and it would be well if the anti-vaccinators were to follow the excellent example set them by his lordship. He remarked that while he

disapproved of the language and conduct of some of those who were opposed to vaccination, these persons ought not to have the least shadow of foundation for their defiance of the law. Perhaps, however, this was saying too much; for there are few laws for the breaking of which some worthless excuse might not be made. The woman who when almost dying of starvation steals a half-penny loaf from a baker's shop, and the convict who after his release from prison, pursues his former avocation because society will not employ him, and because he cannot starve, might plead at least some shadow of foundation for their crimes. It was also urged, that by constant transmission through various sources the lymph became deteriorated, and became the vehicle of other maladies, and that it was desirable to follow the example set by Belgium, and vaccinate from the calf. That there is a good deal of unsuccessful vaccination throughout the country, few would venture to deny, but this does not arise from the bad quality of the lymph, for as Mr. Sclater-Booth remarked, it was an error to suppose that the lymph in use in this country was worn out by lapse of time, the fact being that it was constantly being renewed. Where the operation failed it was owing, as Sir T. Laurence pointed out, to the carelessness or unskilfulness of the practitioner, or to the use of impure lymph. Considering the millions of persons who are vaccinated, it is no wonder that now and then we should hear of the operation being imperfectly performed, or that here and there a child is vaccinated from another unhealthy child. But this does not often occur. The Government authorities are doing all they can to prevent any abuse of the Vaccination Acts; but with regard to the performance of vaccination, both in respect of the operation itself and the purity of the lymph, a great deal must be left to the medical practitioner, and we hope that few cases will be heard of to show that the profession has abused the confidence which has been reposed in them. There has been much talk of vaccination from the calf, but there are many difficulties in the way of carrying out this system among large populations. It has not been so successful in Belgium as many would have us believe; and we are told that as late as 1875, Belgian physicians had discontinued the use of animal vaccine, finding it defective in the matter of certainty.

But the most important point for discussion was undoubtedly Mr. Pease's amendment, recommending an inquiry for the purpose of ascertaining whether any alteration should be made into the law relating to the accumulation or repetition of penalties for infringement of the Act. Long ago we pointed out that some such alteration was not only desirable, but might be made without in any way weakening the force and compulsory nature of the Acts. And the amendment, with the original motion, appeared to be lost more out of fear of doing anything that might encourage the at present limited agitation against vaccination, than from any objection hon. members had to a few alterations in the law relating to the infliction of penalties. Mr. Sclater-Booth himself said he would be glad if he could see his way to remove the evils attendant upon the imposition of cumulative penalties; and Mr. Forster was glad to find that the President of the Local Government Board was not opposed to the principle of the amendment which he, from his experience in the administration of the vaccination laws, was strongly inclined to support. The repeated and petty prosecutions of parents for their resistance to the Acts, with the repeated infliction of small fines which are in nine cases out of ten paid by the society which encourages their transgression, is neither a very dignified proceeding on the part of the Government, nor a proceeding calculated to infuse into the minds of these misguided people a due respect for the majesty of the law, nor the best way of making vaccination a popular and universal operation. Mr. Forster said he was in favour of letting the people alone who were conscientiously opposed to vaccination; but were this plan to be unconditionally carried out, such a large number of children would remain unvaccinated through the conscientious scruples of their parents, backed and even fostered by the representations of the anti-vaccinators, that, when the next epidemic of small-pox occurred, the mortality would be probably greater than it has ever been before. If fines are altogether remitted, vaccination is no longer compulsory. If the parent is only to be prosecuted once, it would be, as Mr. Walter hinted, equivalent to giving a dispensation against obeying the law. If therefore the abolition of penalties, the imposition of one penalty only, and repeated or cumulative penalties, are all equally objectionable, it may be asked what could be done, short of doing away with compulsory vaccination, in the event of the legislature hereafter deeming it necessary to make some alteration in the punitive clauses of the Acts? We would suggest, as we did when last our attention was directed to the subject, that the accumulation or repetition of penalties should be given up, and that after the first conviction the parent be no further prosecuted, but with this provision that in the event of one of his unvaccinated children contracting and dying from small-pox, he shall be indicted for manslaughter, or shall at least be subject to a very heavy fine and imprisonment.

It is however to be hoped that the expectant policy pursued by the present House of Commons will be justified by the course of future events. It is to be hoped that in proportion as the people become more educated, vaccination more carefully and thoroughly performed, and its prophylactic powers more fully recognised, the prejudices which exist among a few individuals will gradually disappear, and that even the society which has so distinguished itself by its opposition to Jenner's great discovery, will at last see the error of its ways, or for mere lack of converts to its principles, become obsolete and finally extinct.

THE TITLE OF M.D.

THE correspondence columns of our contemporaries overflow with the sophistry of writers who, being College of physician licentiates, exhaust their logical faculties in the endeavour to show that they are entitled to call themselves doctor, and *ergo* to write themselves down M.D. While we are not forgetful of the fact that the upper rank of the profession have no desire to claim distinctions and titles which they don't possess, we think this discussion worthy of notice, because it arises just at

PEPSIN-ESSENZ (Liebreich.)

This preparation is sold under the guarantee of Dr. Oscar Liebreich, Professor of THERAPEUTICS in the University of Berlin. In a paper on "The Uses of Pepsin in Medicine, and its Preparation," which appeared in the PRACTITIONER for March, 1877, Dr. Liebreich says—"*I strongly recommend practitioners, for all therapeutical purposes, to employ such a solution.*"

"A sample of 24 grains of the Pepsin-Essenz, containing only from 1-16th to 1-20th part of a grain of the active principles of Pepsin, was then taken, and its action compared with one grain of the best solid Pepsin procurable, and proved in every respect equal to it. The remarkable fact was therefore demonstrated, that this very minute portion of peptic principle in the wine fully equalled twenty times its weight of solid Pepsin, and it is possible that when taken into the living human stomach the proportional digestive action may be even greater."—H. C. BARTLETT, Ph.D., F.C.S.

"We have ascertained clinically that a teaspoonful of this very light and palatable preparation, taken, according to direction, after food has a considerable power of aiding imperfect and diseased digestion."—*British Medical Journal.*

"Dr. Liebreich's Pepsin-Essenz is agreeable to look at and pleasant to the taste, and in some cases in which we have employed it the result has been highly satisfactory. We think it well worthy the attention of the profession."—*Medical Times and Gazette.*

Supplied in bottles, 3s. each, by all Chemists,

the moment when the status of university medical qualifications is in the balance, and when a danger of the utter degradation of the Doctorate of Medicine presents itself as an actual probability.

This question cannot arise upon the use of the word "Doctor" by persons who are not M.D.'s, because that title has come, by use, to signify nothing. Every general practitioner—nay, every medical student—is doctor by courtesy, for there really exists no other single word in our language which implies a general connection with our profession. The public cannot call their family adviser Physician Jones, or Surgeon Robinson; and, if they did, neither title would convey the idea of general medical practice; and there is, therefore, really no misrepresentation in a licentiate of a college of physicians dubbing himself "Doctor," by the ready method of his brass door-plate, or permitting his patients to exalt him to the level which it is the special privilege of university graduates to occupy.

The unauthorised use of the title M.D. has a very different ethical aspect, for it is a deliberate misrepresentation as to the professional rank held by the person who makes use of the title. It does not admit of defence or palliation that a licentiate of a college of physicians should append to his name the distinctive mark of a university graduate; and we feel bound to go the length of saying that such an assumption of title is a discreditable misrepresentation. In the first place, the highest legal authorities have declared from the bench that a college of physicians does not and cannot confer the degree of M.D., and that the license of such a college cannot authorise any one to put himself forward as an M.D. The correspondents of our contemporaries exhaust themselves in the effort to prove that the examinations are as good in a college of physicians as in a university, that the legal rights of each are equivalent, and that etymology makes a doctorate and a license all the same. These arguments may be true or false, but they do not seem to us to touch the point of the misrepresentation. What does the licentiate who appends M.D. to his name expect that the public will infer therefrom? Does he not show perfectly well? Does he not adopt the letters with the hope that he will pass for a university graduate? It is manifest that there is a something in that name which is coveted as a distinction, and no one knows better than the licentiate doctor that that something is the guarantee which the M.D. gives, or did once give, that the holder of the degree had received a gentleman's education. Up to the time when the Queen's University commenced to distribute its doctorate to students who had undergone no arts study, saving a few weeks in a Queen's College, every university doctorate involved a Baccalaureate in Arts and four years academic study, usually with residence in the University; the public and the profession respected a man who had gone out of the way to educate himself to the highest standard, and the time and money expended in the arts education were recouped to the graduate by the position which he enjoyed. It is that position which physician licentiates covet—which the Queen's University professes to offer them at a nominal arts education and the Durham University at none at all. We submit that any M.D. without arts graduation is a pretence, and *à fortiori* that a physician's license gives no claim whatever to such a title, and we deeply regret—in the interests of the profession—that either institutions or individuals should be encouraged to sail under false colours.

If apology be needed for our speaking strongly on this subject it will be found in the following paragraph which we quote from the correspondence of the *British Medical Journal*, and which is seriously recommended to the consideration of the Durham University by the *Student's Journal*:—

"The University of Durham affiliates colleges in arts and theology in different parts of the world. Why should it not affiliate all the London medical schools, giving students M.B. and M.D. after passing a set of fair and reasonable examinations either in London or Durham—not such terrific ordeals as the London University ones?—The way would then be open for admitting qualified men—past students of London hospitals—to modified preliminary and primary examinations, and to a thoroughly good practical and scientific final. No student or practitioner would then have any cause for complaint; and if an Oxford, London, or even a St. Andrew's graduate should despise the Durham man's degree, he could easily show the (supposed) superiority of his own by adding to it the name of his University. Probably, Durham would give honorary degrees to any disgusted London graduates who do not care to share their degrees with medical women."

When it is proposed that London medical students shall be dubbed Doctor of Medicine without arts study or medical qualification whatever, it seems to be time for the Universities to move.

A NEW TREATMENT OF SUNSTROKE.

A FEW days ago *The Daily Telegraph* devoted a long leader to the consideration of a novel method of treating sunstroke, recommended by Mr. Smeaton, an engineer, and the attested success of which is, remarks our contemporary, not unworthy the candid attention of medical practitioners. As, moreover, we are told that if the ground Mr. Smeaton takes be found solid, medical science may be congratulated on having moved a step forward in the path of progress, none the less important because associated with a simple discovery of a layman, it would ill-become us to pass it by altogether unnoticed. In narrating his experience among workmen in brick-fields—which appears to have been considerable—Mr. Smeaton informs *The Telegraph* that it was no uncommon thing in an intensely hot season for some of those "fielders" to be suddenly stricken down and seized with vomiting, violent headache, and delirium. "But I do not recollect," says he, "one individual treated under the method I am accustomed to follow, who suffered any after effect, or had a second sunstroke." The patient when taken was immediately carried to the shady side of the burning kiln, or into an adjacent shed; a pail of water was fetched and a red-hot brick thrown into it. The feet of the sufferer were then placed in the heated water, and more hot bricks were added until the water was raised to a very high point of temperature. Simultaneously, hot bricks were so arranged as to form a pillow for his head and the back of his neck. His face and hands were bathed with hot water, which was afterwards

removed, and fresh hot bricks were then applied under the neck and head. The process resulted in the restoration of the patient to consciousness in fifteen minutes or half-an-hour, when copious perspiration and a tendency to sleep supervened. Spirits were administered at intervals to stimulate circulation, and on the patient waking the cure was found to be complete.

We may smile at the confidence and the complacency with which our contemporary would view this method of treatment, but some of the arguments which Mr. Smeaton urges in favour of his plan are more plausible than the reader would imagine. "Coup de soleil (he says) is a species of heat-bite, strictly analogous to frost-bite, and subject to the same curative laws. It is caused by heat and should be cured by heat, although not by the heat in the precise form which caused sun-stroke." And he is convinced that the proper treatment of this affection "is the immediate application of substances capable of absorbing redundant heat from the system rapidly, and, by counter irritation or otherwise, attracting a portion of it to some organ not so delicately related to the centre of vital force as the brain is."

It may be shown, however, that his treatment is more erroneous in practice than it is in theory. The necessity of reducing the redundant heat of the system in these cases has long been recognised by medical men, but that the best method of fulfilling this intention is the employment of hot applications, as above recommended, we must have much better proof than that afforded by the exposition of Mr. Smeaton. It has, however, been incontestably shown that no plan is so effectual in reducing the temperature of the body in cases of hyperpyrexia as the application of cold. Dr. Wilson Fox has cited many cases in confirmation of this statement. In two cases of recovery under this treatment the temperature in one case reached 110°, and in the other 107·3°; and in the management of cases of sunstroke, Sir Joseph Fayrer, whose experience in India is far more valuable than any that can be obtained in this country, insists upon reducing the temperature of the body as quickly as possible by use of the cold douche to the head and body, mustard poultices, and purgative enemata. Nor is Mr. Smeaton right in saying that the "orthodox treatment has been attended by purely negative success, as in nine bad cases out of ten the result has been mental or physical derangement, or death." The experience of the profession in India would lead to the very opposite conclusion, and the same high authority above mentioned states, that of numbers of soldiers who were struck down in the Burmese war in 1852 by the direct action of the sun, all recovered under the cold water treatment except two, who were bled on the spot where they fell.

Mr. Smeaton's theory that sunstroke is a species of heat-bite, analogous to frost-bite, and that the principles of treatment are the same in both, will not bear a moment's examination. In rubbing (not merely applying), a frozen finger with snow, we have two objects in view, one to restore the circulation by the rubbing, the other to moderate the reaction which is apt to take place when the circulation is restored by the use of snow or ice. In cases of frost-bite we have only to look to the restoration of the natural circulation in the parts affected. In sunstroke the case is very different. The disorder of the cerebral circulation is only a small part of the mischief we have to deal with. The hyperæmia may or may not be a matter of serious consideration. The great danger lies in the paralysing effects of the heat upon the functions of the brain. The nerve centres are overheated and overwhelmed by the intense heat and hyperpyrexia of the system, and until the temperature is lowered they cannot recover from the shock they have received. So far as the hot plan of treatment encourages perspiration, it may do good, as free perspiration assists in carrying off the superabundant heat, but that it will ever be found so efficacious as the method that is now generally adopted by the profession, we do not for a moment believe. At the same time we are not aware that such a plan of treating insolation has ever been thoroughly tested by those who have the best opportunities, and who are most competent, to form an opinion on the matter. At all events the fact that a remedy was recommended by a layman, would never raise in our minds a prejudice against it, provided its value has been proved and not found wanting.

Notes on Current Topics.

Ovariotomy in Dublin.

During the last few weeks ovariotomy has been performed four times in our Dublin hospitals, namely, twice in the Rotunda by Dr. Atthill, once in the Adelaide by Dr. Barton, and once in the House of Industry Hospital by Mr. Stokes. The two former and the last have been perfectly successful; Dr. Barton's, we regret to say, failed. Thus three out of four lives have been saved.

We congratulate Irish surgeons on this satisfactory result. Hitherto the same success has not attended the operation of ovariotomy in Dublin which has been attained elsewhere. We trust that a new era is commencing with us, and that we shall for the future be enabled to publish in respect of Ireland as satisfactory a record as that afforded by the sister kingdom.

We doubt, however, that if the particulars of *all* the cases operated on in England were published they would show better results than those even as yet obtained in Ireland; for we are in a position to say that in several provincial hospitals, and in some of the London ones, the mortality has been very great. But these are not generally known, while those performed by Mr. Spencer Wells and his colleagues are the ones with which Irish surgeons are accustomed to compare themselves. This is hardly just; for beyond doubt, the mortality after ovariotomy is greater in general hospitals than in private practice, or in an hospital set apart (as the Samaritan virtually is) for the special purpose. Nearly all the operations performed in Ireland have been in general hospitals. Thus Dr. Barton's and Mr. Stokes' patients were operated on in wards occupied, till but a day or two before, by patients suffering from various diseases. In the Rotunda special provision is made for these cases. A reference to our "Original Communication" in this day's issue, will show that there "a ward isolated from the rest of the hospital," is set apart for ovarian cases. Nor that alone; the patient

is not admitted into it till the morning of the operation, and on her discharge it is closed, nor again opened till another case is ready for admission. When, after being specially prepared for her reception, the patient is admitted as before, on the morning of the operation. In the Rotunda, too, the ordinary hospital nurses are not admitted, so that the system of a separate hospital for ovariotomy is imitated as closely as possible. There can be no doubt but that the governors of the hospital—acting, probably on the advice of the Master—are carrying out a most judicious course in making this arrangement; and we believe that the care and attention bestowed by Dr. Atthill in the management of these cases will, in no small degree, raise the reputation of the Irish School of Surgery.

Funeral and Mourning Reform.

Respect and reverence for the dead are the universal characteristics of not only civilised, but of barbarous nations, varied of course as to the manner of testifying them. It is a laudable feeling that induces mourners in civilised nations to represent their grief by external signs, as black and crape, and other symbols of sorrow; and we could find little fault with this fashion, if it were restrained within reasonable bounds, and did not too often violate the rules of prudence and common sense.

We are unfortunately led away too much by the force of fashion in the disposal of our dead: there is too much pomp and pageantry, too much of the mockery of woe, in the solemn march of the well-fed, well-groomed, well-bedecked Belgian horses, in the waving plumes surmounting the badly-designed, inartistic hearse; in the massive, ornamented coffin; in the rich and heavy mourning, and too much sad mockery in the accompanying mutes, who, with seemingly doleful countenances, are in reality longing to plunge their noses into a pint of beer at the nearest public house.

When Dives departs this life, we have all the magnificence and solemnity of a fashionable funeral, and we subsequently see its success in the rich mourning and equipages of the relict, which oftentimes indicate the amount of £ s. d. which Dives left to his widow, heirs, and assigns. We have said that the force of fashion is very binding. Dives' estate can well afford the extra expense, but those not so blest with the world's wealth, feel tempted to rival or imitate the foolish expenditure of the rich man's funeral, in order to stand well with the world, and to conform to the all-devouring Moloch of custom.

There has been a feeling of later years to curtail funeral expenses, but we believe that much yet remains to be done in this respect, not only with the actual cost of the funeral itself, but with the habit of wearing mourning, both complimentary and otherwise.

The experience of every medical man will have furnished him with instances of cases, where this fashion of sorrows has caused serious inconvenience, and where the little money left, after the demise of the bread-winner, in place of being applied to better purposes, has been wasted on useless frippery, under the misplaced sentiment of paying respect to the loved departed one.

When death enters the households of certain classes who have limited incomes, and, perhaps, large families, the outlay for mourning is almost ruinous, especially if a long tedious illness has preceded the necessity for its adoption, and more especially if a succession of deaths have occurred.

Leaving the higher and middle classes, we find even amongst the poor who follow the example of those above them, that the funeral and other expenses absorb all their savings, or what they receive from benefit or burial societies, and that in the attempt to appear respectable, they have made themselves paupers, and in too many cases have to apply to boards of guardians for relief. To such an extent is this feeling manifested in Ireland that amongst the lower classes sons, who are content to leave their parents to live and die in the workhouse, will spend every shilling they possess in a wake and funeral afterwards, and widows will leave their children without food to give "a dacent berryin" to their husband.

We need then some reform in this matter. The force of example is very great, and if it were taken in hand by those who have wealth and intelligence and sufficient moral courage to run counter to popular fashion, we feel convinced that a great amount of good might be done and much misery saved.

This might be made woman's work, and as we have at the present time a superabundance of feminine energy seeking an outlet, we believe it could not find better vent than in devising some simpler and cheaper form of mourning, and in thoroughly remodelling the funeral code.

The Discovery of Anæsthesia.

It is a remarkable fact in the history of modern medicine, that many of those discoveries upon which we place most value, owe their origin partly to accident and partly to the perfection of a science which has been of more benefit to mankind, and which has more completely revolutionised the comforts and conveniences of life, than all the other sciences put together. It is indeed impossible to overrate the obligations we are under to chemistry; and judging from the assistance which that science has already rendered to us in our battle with disease, and in the abolition of pain, it should seem as if the remedies it has placed at our disposal will far surpass any that have hitherto been furnished by the vegetable kingdom. The discovery of anæsthesia is one of those happy discoveries in which chemistry, accident, and human ingenuity, each played a conspicuous part. We do not owe the means by which a patient can be made insensible to the severest operations, either to the physiologist, the pathologist, or the physician. To a chemist and to a dentist we are indebted for one of the greatest boons to suffering humanity. Chemistry and dentistry may lay claim to what has been too often regarded as a purely medical discovery. The discovery of anæsthesia has been for a long time associated in the minds of the English public with the name of the late Sir James Simpson. His discovery of the anæsthetic virtues of chloroform, his great reputation as an obstetrician, the success with which he advocated the general employment of that agent, especially in obstetric practice, have led many outside the profession to suppose that the introduction of anæsthesia itself was alike a product of his fertile brain. But the idea that chloroform, which so closely resembled ether in its chemical

constitution and physical properties, probably shared the anæsthetic virtues of that compound, is an idea that might have occurred to many, and a fact which, if Simpson had never lived, would not probably have remained long unknown. It is generally admitted that the "prelude," to this great discovery was the partially successful attempt of Horace Wells, an American dentist, to administer nitrous oxide gas; while the discovery itself is in this country generally allowed to be due to another American dentist of the name of Morton, who showed how complete insensibility to the most painful operations might be produced by the inhalation of ether. It would appear, however, that our American *confrères* have not been very unanimous as to which of their countrymen the honour of having discovered anæsthesia is due. The *Boston Med. and Surg. Journal* remarks that "Dr. Sims, the avowed supporter of Horace Wells, has recently learned that Dr. Long, of Georgia, had given ether for minor operations before Dr. Wells made his memorable failure at Boston." This, if true, of course puts Wells utterly out of the question, but Dr. Sims is apparently too deeply committed to drop him, and is reduced to the necessity of dividing the honour between Long, Wells, Morton, and Jackson. He proposes that the whole profession should ask Congress to appropriate one hundred thousand dollars to be divided between the families of these four gentlemen. It is not improbable that such a motion will be made at the coming meeting of the American Medical Association. That it would have little effect may be considered certain, for Congress is in anything but a "giving vein" at present; but we should be sorry to see the Association commit itself to such a policy.

"We have repeatedly stated what we believe to be the facts of the case, and we see nothing in Dr. Sim's pamphlet to modify our opinion. It is briefly this: the idea of the possibility of anæsthesia is probably very ancient; various persons have had more or less definite ideas of applying it, but the honour belongs to him who made it a reality, and that merit is Morton's."

The Irish Local Government Board and the Press.

THE Dublin press has joined with us, with unanimity, in condemning the course pursued by the Irish Local Government Board in calling for the resignation of a Poor-law medical officer, because he had handed to THE MEDICAL PRESS copies of official documents which had become public property upon their communication to the board of guardians and dispensary committee. The *Evening Mail* says:—

"It is very proper that our contemporary should enter, as we do also, a strong protest against such an attempted mode of dealing with any gentleman standing in the relation to the Board of a medical officer partly only responsible to them, and whose perfect professional and personal independence is in no degree limited by anything in the statutes affecting his position. On all occasions we are anxious to maintain order and discipline, but neither was infringed, as we hold, by the publication in a medical journal of a correspondence relating to medical interests in regard to a Poor-law appointment, the letters not being in any sort of a private nature. We shall not speak of the act of the Board as 'grossly illegal' or as 'audacious;' we prefer to consider it as hasty and ill-advised, and it was so soon repented of and recalled that we can treat it as a mistake acknowledged, and believe that it will not be repeated. The public are justly jealous of any attempt of a department to interfere with the fullest statement of the facts of every case when it has become the property of the public, and all letters of the Local Government Board to the Boards of Guardians are the property of the public. It will never again, we believe, enter into the confused head of any official of the department, far less of a commissioner, to regard as sufficient ground for dismissal the fact that the medical officer gave the conductor of a newspaper a copy of a public document merely because the conductor of the newspaper, in the exercise of his own discretion, and acting within his own right, chose to place over the document when printed a heading which was sharp and displeased the Board. The Poor-law medical officers do not hold their places on a tenure so slight as this; nor has any Board in Ireland been clothed with arbitrary powers over officers of such a class."

"We take the liberty (says *Saunders' News Letter*) of assuring the Local Government Board that they very considerably overrate their power, and underrate the consideration in which the medical profession is held in Ireland, if they think they can adopt this high-handed method of dealing with their medical officers. If the letters of the Board were not fit to see the light, would not bear examination, would reflect discredit on the department from whence they were issued, more shame to the Local Government Board. If, on the other hand, the letters were justifiable and becoming, and fit to bear the criticism applied to them by our medical contemporary, what grievance has the Board to allege against the gentleman who gave their contents to the readers of THE MEDICAL PRESS? The Board have no legal power to dismiss medical officers who commit no offence and neglect no professional duty, and we presume no jury would regard as 'sufficient grounds' the act of self-defence which consists in sending to a public paper an official letter addressed to him by a presumably deliberate and well-advised public body."

The *Freeman's Journal*, writing on the same subject, says:—

"The Local Government Board does not improve. The trio seem to have resolved that they will show how a Board can conduct business in Ireland, and not only defy opinion but soar superior to censure. A couple of cases of blundering extraordinary have been brought to light in the columns of THE MEDICAL PRESS, and we think that more than professional judgment ought to be pronounced upon them. From first to last the policy pursued was weak, foolish, wrong, and illegal. They were made aware of a grave impropriety. They first recognised and pretended to condemn it. Then they ignored it and condoned the proceedings which they had previously censured. In the next place they initiate a system of terror, and when they find themselves boldly met they flounder off in fear. A decision of this sort is calculated to frustrate all attempts to observe the law and preserve order. This Board is the only one whose doings come before the country. And are they not amazing? If we knew the whole truth, or even a little, about the other bureaus which mock and mismanage and muddle the public interests, what a tale might be told to a listening Parliament!"

Enough has been said and done in this matter we hope, to vindicate the independence of Poor-law Medical Officers and the rights of the Press. We shall, therefore, not refer further to the transaction than to say that we distinctly assert the right of journals to publish and criticise the public correspondence of the Local Government Board, and of Poor-law Medical Officers to make public such of it as is in the nature of official pronounce-

ments communicated as such to guardians or committeemen. Furthermore, we repudiate the assumption that the Local Government Board possesses any legal authority to remove a Poor-law Medical Officer except for neglect or incapacity for duty, or for conduct calculated to unfit him for the efficient discharge of his functions.

Chinese Medicinal Plants.

THE Right Hon. the Earl of Derby has recently forwarded to the Society of Apothecaries a collection of articles of Chinese Materia Medica, obtained in 1875-6 in the country traversed by the Yunnan Mission. It was accompanied by a printed copy of an interesting Report by Mr. Davenport "on the trading capabilities" of that part of China. The specimens consist almost entirely of roots, stems, leaves, barks, and woods; and there are no mineral substances. They are neatly put up in paper parcels, of which there are 105, and each of them is inscribed with the name of the contents in Chinese and in English characters, together with the local prices. These parcels are distributed into four packets, but there is also a fifth packet containing specimens of native opium, some samples of which are in the crude and dry state, and others in the state of a soft extract. The botanical specimen appear to be more curious than valuable. Some account of the properties which have been ascribed to them by the Chinese, will be found in the "Contributions to the Materia Medica of China," by F. Porter Smith, M.B.; and in the "Notes on Chinese Materia Medica," by the late Daniel Hanbury.

We are informed, however, that in most cases the properties attributed to these plants are entirely fanciful; and that those natural orders of temperate, which possess active properties are almost absent in this collection. There are no Cruciferæ or Solanaceæ, and scarcely any Compositæ or Umbelliferæ; Labiatæ and Rubiacæ are very few, and there are no Scrophulariaceæ or Euphorbiaceæ. Only one imperfect specimen of rhubarb occurs. This is the more remarkable considering that the region from whence these articles have been obtained is situate in about 25° N. and being much elevated, sometimes rising to 6,000 or 8,000 feet—is very temperate.

The most important part of the collections is the opium, for although in the preparation of the crude opium there is room for improvement, in the samples of soft extract there is evidence of much pharmaceutical skill. The specimens of native opium have been examined and analysed by Mr. A. Stewart, principal chemical operator to the Society, who furnishes a detailed account of their qualities. The results of this analysis show that the crude specimens are far inferior to Turkey opium in the yield of morphia, the highest percentage of which is only 8·05 per cent., whereas from 13 to 14 per cent. is obtained from fine Turkey opium. On the other hand the soft samples yield an amount of morphia nearly equal to three times as much as the dry samples, amounting in one instance to as much as 15 per cent. As, moreover, these soft specimens are procurable in China, at the low price of 8s. per lb. while fine Turkey opium is as much as 23s. to 24s. per lb. in the London market, it is probable that in a commercial point of view, they would enter into successful competition with the best Turkey opium for the manufacture of morphia, and find a ready market in Europe.

We may further state, that all the articles above mentioned will be preserved in the cabinet of materia medica belonging to the Society of Apothecaries.

Prescribing Druggists.

THE evils resulting from the practice of chemists prescribing medicines as well as dispensing them, seem to have been as keenly felt in America as in England. The best way also of putting a stop to the practice has been as much a subject of debate in that country as with us. At a meeting of the Connecticut Medical Society, Dr. C. M. Carleton moved "that we, as physicians, will not allow our prescriptions to be dispensed by any druggist who shall himself prescribe for any disease, or allow any clerk or assistant in his employ to prescribe."

In support of the resolution, he stated that the evil was one of great magnitude, both to the physician, who was thereby defrauded, and to the patient who was made to suffer from the unskilful treatment. The remedy for this lay within the power of the physicians, if they would exercise it.

Dr. Lindsley thought that little could be accomplished by hasty action, or by implied threat, and that it would be difficult to secure concerted action. He spoke of the pharmaceutical associations as composed of honourable men, and suggested a conference with them.

Dr. Carleton said that counter-prescribing had been fully suppressed in Lynn, Mass., by concerted action of the druggists and physicians, and offered the following substitute for his resolution, so that it should read: "Any druggist who shall prescribe, or allow any one in his employ to prescribe, violates the proper and just relations which should exist between the physician and druggist."

After considerable debate, the whole matter was referred to a Committee on the Relations between Physicians and Druggists, who were to act as delegates to the State Pharmaceutical Convention, and report at the next convention.

We have so recently expressed our views of this question that it would be superfluous to make any further remarks on it, and we merely cite the above preceedings at one of the American Medical Societies, to show how widespread is the evil of which the profession has had much reason to complain.

The Formation of Corrosive Sublimate in the System.

CAL. C. SACCH, is one of the commonest prescriptions for children, and we might ask our readers would they be surprised to hear that it was a dangerous one?

Calomel is a valuable, useful and convenient purgative, especially for children, but we are told that it may be changed into the bichloride of mercury by combination with other substances.

When calomel in powder, is mixed with powdered white sugar or magnesia, it forms in 24 hours a corrosive sublimate.

According to the *Osservatore Med. Sicelind*, No. 1. 2.

1877, Dr. Polk, has observed all the effects of poisoning, by corrosive sublimate, produced by the administration of calomel and sugar prepared for a month.

The examination of the remainder established the presence of a notable quantity of the bichloride of mercury.

The same fact, is stated in the *Journ. de Pharm. et de Chem. Turin.* Nov. 1875, where pastilles were used.

The pastilles contained sugar, which acted on the calomel, and transformed it into the bichloride.

On the other hand, Carlo Bernadi, Pharmacian Milan, (*Bulletin Pharm. de Pietro Viscardi* Oct. 1876) has made numerous experiments and concluded: that the poisoning was not due to the formation of corrosive sublimate, but to the impurity of the calomel employed.

Further experiments are necessary to settle this point, and they will not certainly be very difficult.

Calomel fortunately, may be given in various other ways, as by simply putting on the tongue without any mixture.

The Limits of Patent Medicines.

A SOMEWHAT curious case has recently been decided in the Exchequer Court at Westminster, in which the question of what is a medicine when considered in relation to the patent medicine duty, was argued before a full bench of judges. The case was briefly this: Mr. Lamplough, a chemist, and proprietor of a beverage called "Pyretic Saline," having received the usual official notice requiring him to register his preparation and pay the customary stamp duty thereon as a patent medicine, and having for nearly a quarter of a century sold the article in question without the 1½d. Government brand, he not unnaturally resisted the demand, and the question has been decided against him—not unanimously, as the Lord Chief Baron ruled in his favour, but by the majority of the judges, and the case will probably be carried to the highest Court of Appeal. Objecting, as we have always done, to the quack medicine business of the Government, we are more than ever impressed with its wrongfulness by the decision in this case. If this simple preparation is to be dragged into the clutches of her Majesty's stamp officers, we do not see how they can consistently allow a bottle of ginger-beer, soda-water, or mineral water to escape the patent medicine badge. Nay, it should go farther: every street-vendor of halfpenny sherbet drinks should be made to pay his quota towards the quack medicine revenue of the country. To our way of thinking the arguments on the part of the Crown, in order to establish an excuse for issuing licences to quackery in a new line, and thus securing more "grist to the mill," were unworthy of the eminent names engaged, besides entailing a waste of valuable public time. Mr. Lamplough, who must now be looked upon as a scapegoat for a new scheme of Government revenue, has our entire sympathy, and should he carry the question to a higher court, we shall be glad to hear that the decision of the Exchequer judges has been reversed.

PRINCE MILAN of Servia has conferred the gold cross of the Takovo order upon Mr. William Collingridge as an acknowledgment of services rendered during the Turco-Servian war. Mr. Collingridge is said to have been the first English surgeon upon the Servian field.

The Suicide of a Blue-coat Boy.

THE account in the newspapers of this unfortunate occurrence is not a very satisfactory one, especially as regards the proceedings at the coroner's inquest. The subject appears to have attracted very little interest or sympathy, and the usual conventional verdict of the jury, without any word of censure or of recommendation being appended to it, is not the least remarkable feature of the case. This suicide shows the serious consequences that may arise from abuse of the fagging system pursued at some of our public schools, and how necessary it is for the masters to keep a strict watch over the conduct of the monitors towards the boys under them. A great deal has been said lately about the abolition of corporal punishment in schools; but it may be questioned whether corporal punishment inflicted by a responsible teacher, and for some special offence is half so intolerable and so galling to the feelings of a sensitive youth as the petty persecutions and bullying treatment of a boy only 2 or 3 years older than himself. Suicide is by no means of rare occurrence in early youth, and although we have little information as to real character and antecedents of William Gibbs, he was doubtless one of those sensitive, wayward, and impatient characters, by whom such a rash act is most likely to be committed. We know that the fagging system was sanctioned by the celebrated Dr. Arnold, but we doubt whether it is now practised, with as much caution and forbearance as it was in his school.

The Prophylactic Treatment of Placenta Prævia.

THERE are several circumstances under which the induction of premature labour is both lawful and advisable; but we are not aware that it has ever been recommended in cases of placenta prævia. In the *American Practitioner*, however, for March, 1877, the induction of premature delivery is advised by Prof. T. Gaillard Thomas, after the viability of the child is established. As for the objection that a child who has had less than nine months of intra-uterine existence has not as good a prospect of life as one that has arrived at full term, it is urged that such would have a brighter prospect when dependent upon pulmonary respiration for the aëration of its blood than upon a crippled and bleeding placenta. For the mother the safety would be doubtless greater. Dr. Thomas believes that when premature delivery becomes the recognised and universal practice for placenta prævia, the statistics of the present day will be replaced by others of a far more satisfactory kind. Eleven cases are adduced in support of this question of living children being delivered, all of the mothers, with one exception, eventually recovering, while, according to the statistics of Sir James Simpson, based upon the analysis of 399 cases, one-third of the mothers, and over one-half the children were supposed to be lost; and Read computed the mortality as one in four and a-half mothers, while the large majority of the children were lost.

THERE were 12 deaths from bathing accidents in London last week, and 17 from fractures and contusions, chiefly occasioned by vehicles in the public streets.

The Medical Benevolent College.

We observe that a special meeting of the governors and subscribers of the Royal Medical Benevolent College is convened for Wednesday, the 25th inst., at four p.m., to consider the important question of canvassing for votes. The Secretary of the College gives notice that the following resolutions will be proposed :—

"1. That in the opinion of this meeting it is expedient to prohibit the practice of canvassing for votes, and therefore in future no application by the candidate, or parent or guardian of the candidate, for votes shall be allowed; and when it has been satisfactorily proved to the Council that this rule has been infringed the Council shall have the power to remove the name of the applicant from the list of candidates, and if elected to declare the election of such applicant void.

"2. That all voting papers be sent by the voter himself direct to the secretary of the College, and that the signature of the governor, with date and address, be appended in full."

We trust the governors of the Medical Benevolent College will set the good example of abolishing a system which has the effect of withdrawing poor widows from their families and households to go about soliciting votes, and forces them to publish their sorrows and distresses on thousands of cards and circulars, at a ruinous cost, in the hope of attracting attention and justice ; while friends are tempted to traffic in votes to help a special case, but not necessarily the most deserving.

Royal Visit to the College of Surgeons.

On Saturday, their Royal Highnesses the Prince and Princess of Wales paid a visit to the London College of Surgeons, for the purpose of inspecting the Hunterian Museum. Their Royal Highnesses were received by Mr. Prescott Hewett, F.R.S., president, and the professors of the College, and were shown that unique collection, which includes as one of the most recent specimens, a skeleton of the female tiger shot by his Royal Highness at Jeypore, during his tour in India last year. The inspection lasted more than an hour, and appeared to give great pleasure to the royal visitors, who thanked Mr. Hewett on leaving.

Claude Bernard on the Glycogenic Function of the Liver.

At the sitting of the Academy of Science, May 28, M. Bernard contributed some new researches on the sugar forming theory of the liver, and concluded—

1st. That the glycogenic property is inherent in the tissue of the liver.

2nly. That this property manifests itself during life, and a certain time after death.

Small-pox reached the lowest stage of fatality during the past week in London since November last. The deaths from this disease were only 43, gradually declining from a maximum of 140. Of this number 22 occurred in public institutions, the remaining 21 in private dwellings. 9 of this number were certified as vaccinated, 17, not vaccinated the remaining cases being uncertified as to vaccination.

The Election of Councillors at the Irish College of Surgeons

In room of Dr. Cronyn and Professor Wilson deceased, and Dr. Jacob resigned took place on Monday last. The candidates were seven in number—Dr. Madden, Dr. Elliott, Dr. Bennett, Mr. Corley, Dr. B. F. McDowell, Mr. Stokes, and Dr. Collins. The assembly of fellows was small, only eighty-nine having voted, and the provincial element was almost wholly unrepresented. On the declaration of the poll it was ascertained that Mr. Corley, Surgeon to the Richmond Hospital, Mr. Stokes, Surgeon to the same hospital and Professor of Surgery in the College, and Dr. B. F. McDowell, Surgeon to Mercer's Hospital were the successful competitors.

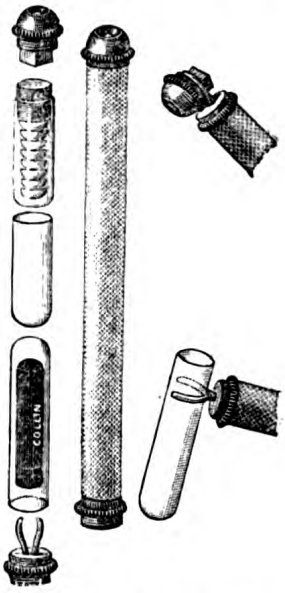
Dr. Guinness Beatty, Ex-Assistant Physician to the Rotunda Hospital, nephew of the late Dr. Thomas Beatty, who occupied the chair of midwifery in the Irish College of Surgeons for many years, has declared himself a candidate for the same professorship, now vacant by the death of Dr. John Cronyn.

We understand that the election of a surgeon to St. Mark's Ophthalmic Hospital, in room of Dr. Rainsford, promoted, has been postponed by the governors until after the recess.

Novelties.

A POCKET CASE UROSCOPE.

In the last number of the *Repertoire de Pharmacie* Mr. Yvon introduces a new apparatus for the examination of urine which takes up little more room than an ordinary clinical thermometer, and can be carried in the vest pocket. The annexed illustration explains this handy little instrument. A metallic tube is divided into two compartments and closed at each end by a screw-stopper. The smaller compartment contains a test-tube for heating urine ; within this tube is a small gutta-percha case with blue or red litmus paper. The stopper fitted to this compartment has an outer and inner space, and bears a clamp in its centre, which is pointed inside when the instrument is closed, but is reversed when using it to form a test-tube holder. The second compartment contains a spare test-tube and another tube, closed with a rubber-stopper, containing pieces of coantis potassa. The metallic stopper of this second compartment contains a small microscope of sufficient power to examine urinary deposits. This part of the instrument is intended to be inserted into the clamp of the other stopper when using it. The operator will be enabled, by means of this convenient arrangement, to



examine the alkalinity or acidity of the urine, to search for albumen or for sugar (by means of the potassa), and to examine the urinary deposits.

Medical News.

Horses in Europe and America.—The editor of the *Veterinary Journal* having investigated the matter, gives the results in the July number of that excellent publication, as follows:—In Russia, 16,160,000; North America, 9,504,200; Germany, 332,231; Great Britain, 2,790,851; France, 2,742,738; Austro-Hungary, 3,569,434 (of which 2,179,981 belong to Hungary); Italy, 657,544; Norway and Sweden, 655,456; Spain, 382,000; Denmark, 216,570; Belgium, 272,163; Holland, 260,056; Switzerland, 100,934; Greece, 98,938; and Portugal, 79,616; making a total in the countries mentioned of 40,854,840. The proportion of horses to each thousand of the population is 227·05 in Russia, 244·16 in America, 175·55 in Denmark, 146·99 in Hungary, 114·88 in Sweden, 86·10 in Great Britain, 81·64 in Germany, and 18·25 only in Portugal. Of mules there are found 1,626 in Germany, 303,775 in France, 214,935 in Austro-Hungary (of which 3,266 are in Hungary proper), 292,868 in Italy, and the large number of 6,665,472 in Spain.

Who was First?—Dr. J. Marion Sims, in a paper in the *Virginia Medical Monthly* for May, denies the claims of Morton, Wells, and Jackson in the discovery of the anæsthetic properties of ether, and brings forward, as the proper person to whom the honour belongs, Dr. Crawford M. Long, of Georgia, who first used ether in the extirpation of a tumour of the neck, on March 30th, 1842. The fact is attested by several gentlemen, medical and lay, who are still living.

Barometrical Improvements.

At the last meeting of the Meteorological Society, Mr. Marriot exhibited and described Bogen's hygrometer and new standard syphon barometer. This instrument is so constructed that it can easily be put together and taken to pieces again. The long leg consists of a tube of the same diameter throughout, and is supplied with a glass stopper, which has a very fine hole bored through its centre, enabling one to fill the tube with mercury in one or two minutes, and to completely exhaust it of air in one or two minutes more. The open end of the long leg is ground air-tight to the short (curved) end, and can be instantaneously put together or separated. The long tube alone is graduated, so as to have only one scale, but by a peculiarly constructed screw of given length placed on the short tube a precise and accurate reading can be easily obtained. The barometer is mounted on a peculiarly-shaped stand, which has three adjusting screws, by means of which the perpendicularity of the instrument can be secured.

NOTICES TO CORRESPONDENTS.

Notice to Subscribers.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in London, Dublin, or Edinburgh.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Scarce Numbers.—Double price will be given for the following numbers of this Journal if sent to the London office:—October 6, December 22, 29, 1869.

Several Letters are unavoidably held over this week.

The Astley Cooper Prize.—The next Triennial Prize of £300 will be awarded to the author of the best essay "On the Cranial Nerves." Such essays to be sent to Guy's Hospital before January, 1880. Full particulars will be found in our advertising columns.

Army Medical Service.—The next examination of candidates for commissions in the Army Medical Department is announced to be held at the University of London on the 13th August. Applications for admission should be made without delay.

Dr. Drysdale's letter has not been inserted because it is for the most part a repetition of that which appeared in our last, and would be sufficiently answered by the editorial comments attached thereto.

Errata.—On page 17, right hand column of our last number, for Dr. *Rouse* read Dr. *Rorie*, line 10 from top. Line 14 from bottom, same column, for *suspension* read supervision.

APPOINTMENTS.

Bryden, R. T., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for No. 13 District of the North Brierly Union, Yorkshire.

Chapman, Dr. J., Resident Physician to the Royal Edinburgh Hospital for Sick Children.

Charles, Dr. D., Medical Officer, Public Vaccinator, &c., for the Bellaghy Dispensary District of the Magherafelt Union.

Davies, J., M.R.C.S., Medical Officer to the Bath Lying-in Charity.

Dickson, J. D., M.D., C.M., Resident House Surgeon to the Buckinghamshire General Infirmary, Aylesbury.

Greenfield, W. S., M.D., M.R.C.P., Assistant Physician to St. Thomas's Hospital.

Harris, V. D., M.D., M.R.C.P., an additional Assistant Physician to the West London Hospital.

James, H. G., L.R.C.P.Ed., Assistant Medical Officer to the East Riding Lunatic Asylum, Beverley.

Martyn, R. J., L.R.C.S.I., Resident Surgeon to the Richmond Hospital, Dublin.

Molony, Henry G., M.D, M.Ch., Medical Officer to the Castletown Dispensary, Croom Union, co. Limerick.

Ottley, W., F.R.C.S.E., M.B., B.Sc., an additional Assistant Surgeon to the West London Hospital.

Pearse, S. F., Physician's Assistant to the Middlesex Hospital.

Playfair, Dr. W., Consulting Physician to the Evelina Hospital for Sick Children.

Roberts, H. W., M.R.C.S.E., Medical Officer to the South Deptford District of the Greenwich Union.

Webber, W. L, F.R.C.S.E., a Surgeon to the Westminster General Dispensary.

Wilding, W. A., M.R.C.S.E., L.K.Q.C.P.I., Resident House Surgeon to the Salop Infirmary, Shrewsbury.

Births.

Grimshaw.—On July 2, at 13 Molesworth Street, Dublin, the wife of Thomas W. Grimshaw, M.D., of a son.

Pairman.—On July 1st, at Robert Street, Hampstead Road, N.W., the wife of Robert Pairman, M.D., of a daughter.

Sharood.—On July 6, at Plymouth, the wife of E. Julian Sharood, M.D., of H.M.S. *Cambridge*, of a daughter.

Stoney.—On June 30, at Abbeyleix, Queen's County, the wife of Hugh B. Stoney, M.B., of a son.

Marriage.

Park—Swayne.—July 4, at Wingfield Park Church, Derby, David Scott Park, F.R.C.S., of Middlesboro', to Frances Adelaide, only daughter of the late Richard Swayne, of Liverpool.

Deaths.

Bridick.—On June 28, at the County Infirmary, Durham, John B. Bridick, aged 59.

Devany.—On June 22, at Sligo, of typhus fever, taken while in discharge of his duty, Patrick Charles Devany, M.D., aged 26.

Gompertz.—On June 23, William F. L. Gompertz, M.R.C.S.E., aged 55.

O'Reilly.—On June 30, at Ballinagh, co. Cavan, Thomas S. O'Reilly, M.R.C.S.E., aged 56.

Scott.—On July 9, at St. Edmund's Villa, London, S.E, Charles Scott, M.D, C.B., Honorary Surgeon to Her Majesty, aged 74.

ON THE DIAGNOSIS AND TREATMENT OF SOME FORMS OF DYSPEPSIA. (a)

By Robert Farquharson, M.D.

The term dyspepsia, if taken in its widest possible signification, is undoubtedly the most comprehensive in the whole range of medicine. When we consider the complexity of the digestive act, the many ingenious and delicate contrivances by which the various constituents of our food are turned to full nutritive account, no less than the important issues which hinge upon the due absorption and assimilation of our daily meals, we can hardly require much persuasion to appreciate the importance of this theme. The main differences between one man and another, the power of work, the buoyancy of mind, the activity of body which are possessed by those who enjoy full health, contrasted as they too often are with the dull depression and restless irritability which mar the lives of many, may be accounted for, in some considerable degree at least, by the working condition of that portion of our machinery which presides over digestion. Do we eat too much, or too little? Are our secretions up to the mark in quantity and quality? Is our nerve-force keen enough to preside efficiently over the functions of stomach and intestines, of liver and pancreas? These are questions which every man ought to ask himself from time to time, or, still better, to refer to the scientific consideration of medical skill.

Considering the wide, although fortunately lessening, ignorance of all matters physiological which prevail among laymen, and the way in which so many graves have been truly said to be dug by the teeth of their own future occupants, we may well understand how a timely meed of good counsel in season may arrest many a downward career. A little consideration will soon show us the large mass of disease caused by intemperate and ill-arranged feeding. What are gout and rheumatism but the outcome of long-continued excesses in nitrogenous and farinaceous diet? Will not a special addiction to fatty and oily matters produce a bilious diathesis, as among the Jews? Can we not trace rickets and scrofula, and many of the so-called diathetic disorders, to some dietetic deficiencies? May not many of the acuter disorders depend for their due *nidus* and development on constitutional peculiarities resulting from mal-assimilation of some altered article of our food?

Questions such as these open up so wide a vista of complicated considerations, that we may well pause on the threshold of our inquiry, and seek helplessly for the clue which may unravel the mysteries before us. This, however, gentlemen, is not to be my ambitious endeavour. Due regard for your time and patience, no less than for my own limited powers, would induce me to restrict my paper within much narrower grooves, and to merely direct your attention to one or two practical points in the diagnosis and treatment of dyspepsia.

And here, at the outset, I must throw myself upon your kind indulgence, and hope that my many shortcomings may be amply supplied by the discussion which will follow. Naturally attracted towards my subject by its many practical bearings, I anticipated far too considerable results from my inquiries, and have found, to my concern, that my field of observation has yielded but barren results. To make any real progress in such an investigation, we must have full command over our patients in hospital, where all needful restrictions may be maintained, and all proper examinations carried out by well-skilled observers from day to day. A systematic interrogation of the secretions, the effects of varying article of diet, and solution of the numerous unsolved question still before us, could only be satisfactorily made by some one who would eschew for a period the more dazzling arena of acute disease, and fill his wards with commonplace dyspeptics. The out-patients, upon whom my observations have principally been made, present many drawbacks. We cannot diet them in any way. We do

(a) Read before the Harveian Society of London, April, 1877.

not even know for certain whether they take their physic regularly or not. In short, the conditions for due and full inquiry are almost at their worst ; and all I can hope is, to have supplied a text from which others may preach, with greater practical knowledge and observation than I can hope to do.

Now, if full time were allotted to me for the discussion of this subject, and if my paper, like Wagner's latest opera, extended over several evenings, the most complete way of grappling with every detail would be to trace the food from its entrance by the mouth until its final exit through the large intestine. Man has been somewhat ingeniously defined as a moral and intellectual tube, open at both ends, and on the integrity of function of any part of this structure depends much of his moral and intellectual force. If the food be not sufficiently chewed in the mouth, if the loss of teeth, or carelessness, or sheer gluttony prevent complete mastication, the saliva cannot duly penetrate the mass, nor can the gastric juice act upon it with proper effect. The bolus worked into a ball by the churning movements of the stomach is made less amenable to digestive operations by coverings of tenacious mucous, and henceforward acts as a mere foreign body, causing flatulence and discomfort, and frequently proving the starting point of troublesome diarrhœa. This, then, may be said to be the first and most fundamental cause of defective digestion—a failure to place the food under proper conditions to receive the action of the various secretions which convert the bulky and heterogeneous meals of modern life into nutritive fluids. Often overlooked as it undoubtedly is, this should form the starting point of our inquiries, and when we are satisfied of the existence of this cause, common sense will plainly indicate the remedy.

The food has now reached the stomach, and here we find the widest field for the study of our subject. The most important part of digestion being carried on here, here it is that we find the most varied and painful symptoms of distress. The many care-worn women who throng our out-patient rooms, and whose pinched faces display the absence of proper nourishment, no less than their anxious expressions show the suffering which follows each attempt to eat solid food, amply testify to the almost universal existence of dyspeptic conditions among the ranks of our very poor. And what a wide range of symptoms are thereby produced! What a variety of tint and aspect! How the expression of face ranges from the thin, pinched, yellow, irritable aspect, to the florid, bloated, pimply face of the chronic drinker and the victim of the gouty diathesis! How we have pain radiating in almost any direction! How we have nervous disturbances artfully simulating organic disease of other organs! Let us examine a few of these in a little more detail.

Now, it often happens that when the patient comes before us no remark is made indicating the stomach as the organ primarily at fault ; but that pain between the shoulders, shooting in various directions, is more especially complained of. With this are associated dull frontal headache, great depression of spirits, disturbed sleep, and constipation, and it is not until we put direct leading questions that we find that the stomach actually is at fault ; or the patient complains in the first instance of palpitation, and has been persuaded by some of those friends who are so ready to tender their worthless advice under all circumstances, that she is the victim of heart disease ; or she may mention the stomach at first, and here we will find that the pain may be of many classes. Constant gnawing pain may be present, and may be relieved by food. This, in my experience, is rare ; or the act of swallowing may be immediately followed by suffering of greater or less severity, either sharp or dull and aching, and only relieved either by vomiting or by the passage of the food into the small intestine. Nausea is generally present, and vomiting frequently follows each meal.

Or, again, the pain does not come on until two or even three hours after eating, and these cases seem to be the worst, giving rise to great and long-continued agony, and making even the very thought of food a misery to the unfortunate sufferer.

A point of much practical importance is this. What information does inspection of the tongue give us in the diagnosis and comparative discrimination of the various forms of dyspepsia? Does the study of that little sheet of exposed mucous membrane give us any accurate clue to what is going on in the important digestive tract of which it forms the first stage? Can its relation to the stomach be compared, for instance, to that which subsists between the retina and the brain? Now nothing has struck *me* so much when studying the conditions of the tongue under various circumstances, as the comparatively slight indications which it often gives of serious digestive derangement, and the way in which people often present good health, with appearances from that quarter which would seem to indicate very grave disturbance. A deeply cracked and fissured tongue, for instance, frequently seems to mean nothing, and I well remember the exposure of the worst specimen of seamed and coagulated mucous membrane in that quarter from the mouth of one of the healthiest looking men I ever saw. He had consulted me about some trifling digestive derangement, and in reply to my summons, produced a tongue which quite staggered me for the moment. It was scored by deep ruts in a way which would indicate something very serious, but my patient told me with some amusement that this tongue had often been a puzzle to doctors ; that it had been in that condition all his life, and that he believed it to be in some degree hereditary. I have often since met with these cracked and transversely fissured tongues to a lesser degree, and not unfrequently in young children, and have never found them to bear any very essential relation to special digestive disturbance, save in this way, that these patients are rather intolerant of purgatives, and that over-free action of the bowels is in them very readily produced.

Then, again, a white and furred tongue often exists in apparently healthy men. When talking, not long ago, to a specially well-developed specimen of humanity, he asked me to look at his tongue, and I then had the satisfaction of inspecting one of the worst I ever saw. His general health was excellent in every way, and the only way in which I could account for the flabby and furred condition of this portion of his mucous membrane was in the habit of smoking to which he was addicted in some considerable degree.

In my experience, the class of tongue which coincides most commonly with digestive disturbance, is that in which the tongue seems to be covered with a thin, white fur, which on minute inspection, is seen to be composed of a series of minute raised dots, and this usually coincides with pain immediately following meals.

If the tongue is raw and quite stripped of epithelium, with enlarged and prominent papilla, as we often see in phthisis, pain immediately after food and vomiting are usual symptoms, or large red papillæ may stand in bold relief through a pale coating, or the tongue may be simply large and pale and flabby, as though too big for the mouth.

These distinctions will often stand us practically in good stead, and the careful and minute study of the tongue in disease may well be recommended to the systematic study of medical men. Like the pulse, this aid to diagnosis stands somewhat in danger of being overlooked in these days, and we must hope that some one will take it up in a broad scientific spirit, and do as much for it as Broadbent and others have done for the pulse. A good series of drawings of varying conditions of the tongue in dyspepsia, would be a real service to clinical medicine.

Having arrived then, at this stage of our journey, I think I shall act best, and avoid tedious repetition, by leaving altogether the further consideration of symptoms, and going on at once to the question of treatment. It would

be but a mere insult to my audience were I talk to you gravely and sententiously about flatulence, and constipation, and nausea, and diarrhœa, and all those things about which you all know a great deal more than I can pretend to teach you. And although the same remark no doubt applies to the more practical part of my theme, we must remember that we are met together, not to listen to a one-sided monologue like a sermon or lecture, but to interchange ideas and to criticise and examine freely all statements and opinions which come before us for discussion.

Now the treatment of dyspepsia naturally divides itself into two parts—that by drugs, and that by diet; and of these, of course, the latter is by far the most important But unfortunately among the class of patients who come before us for gratuitous relief, any effectual re-arrangement of their daily meals is quite out of the question.

These poor creatures must eat what little they can, and where and when they can, and no more bitter mockery can be conceived than to order for them articles of diet which is utterly out of their power to procure. All we can do, is to correct any very glaring and remediable errors, and to give such drugs as experience has taught us to value, as likely to afford relief to the varying symptoms under which our patients suffer.

And first let us consider pain. Now very violent epigastric pain, with tenderness to deep pressure and vomiting invariably following food, most likely depends on gastric ulcer, and with it we have nothing to do. But the minor forms of suffering, beginning immediately after eating, and causing a worrying and tearing sensation which only thoroughly leaves when the stomach is relieved of its contents, depends probably either on a tender and irritable condition of mucous membrane, which resents both the rough contact of undigested food and the vermicular movements which digestion demands, or are the secretion of a large excess of gastric juice which teazes and worries the unoffending organ. Such cases would, no doubt, be most effectually treated by rest, and could we persuade our patients to lie in bed and derive their nourishment exclusively from the lower bowel, no doubt a speedy cure would be the result. But the severity of the case hardly merits a line of treatment which is so useful in gastric ulceration, and we will generally find soothing remedies to act well. Carbonate of soda, bismuth, hydrocyanic acid, with gentian and calumba, taken immediately after meals, are here of great service, and will frequently restore appetite, cease the headache, palpitation, depression, and wearing special intercostal pains which often coincide to add to our patients' miseries. We all remember the case of the man who was seized with violent pain in his great toe after eating ice, and who only obtained relief by the prompt expulsion of the foreign body; we have often seen severe headaches rapidly removed by a little alkali; and in the protean forms of sympathetic derangement met with in dyspepsia, we will do well to begin, at all events, with this class of drugs, remembering also that small doses of nux vomica are often of great use. It might seem reasonable, however, on purely theoretical principles, granting the correctness of Ringer's teaching, that acids check all secretions, and granting also that many of these cases of pain immediately after food depend on an excess of gastric juice, to prescribe an acid immediately before the meal. But this will not usually be found successful in practice. The mucous membrane of the stomach being usually sore and uncomfortable, is merely worried in additional measure by the new source of irritation, and we may be reduced to give our alkali after all to neutralise the effect of our own treatment. Where acids come into most beneficial operation is where pain is delayed for two or three hours after food, as happened in the following case:—

Lucy L., æt. 25, consulted me on Sept. 8th, 1876, at the Western General Dispensary. She wears an anxious, pained look, face pale, tongue large, white, and flabby, indented by the teeth at the sides, reddish streak down the centre. States that she has very severe pains, coming on about two or three hours after eating, preventing sleep at night, but always so severe as to make the very idea of food a misery to her. Is frequently sick, which gives great relief. Solid food causes most suffering. On Sept. 26th, my notes record that mist. soda and calumba, including ginger and gentian, was ordered. No relief has followed this line of treatment, and I accordingly prescribed the mist. gent. acid, composed of acid sulph. aromat. infus. gentian, to be taken immediately after food. On Oct. 2nd she stated that the pain was nearly gone, and that she could eat solid food; and on the 9th she was entirely free from pain, and with an appetite considerably in excess of the supplies of food which her circumstances enabled her to obtain.

We have here an illustration of Ringer's law. This patient's sufferings, no doubt, depended both on the presence of surplus acid annoying the mucous membrane of the stomach at the close of primary digestion, and on the formation of other acids by a process of premature decomposition of food, both of which were checked by the remedy given prior to the secretion of the gastric juice.

But it seems also reasonable to believe that an excess of acid may act prejudicially, by neutralising the alkaline reaction of the pancreatic and biliary secretions, and thus preventing the full development of their physiological properties.

Pain may also occur after the food has left the stomach, and may be duodenal or intestinal; and in the latter case, but more especially where diarrhœa exists, we will best give relief by sweeping away the offending substance by a purgative dose of castor oil.

(To be continued.)

ABSTRACT OF
CLINICAL LECTURES ON SYPHILIS.

By S. Messenger Bradley, F.R.C.S.,

Surgeon to the Manchester Royal Infirmary, and Lecturer on Practical Surgery, Owen's College.

Lecture III.—*Tertiary Syphilis—Two Forms of Exudation, diffused and circumscribed—Affections of Skin—Mucous Membrane—Cellular Tissue—Bones—Cartilages—Muscles and Tendons—Blood-vessels—Viscera.*

Tertiary Syphilis.—Syphilis does not always proceed beyond its second stage: be it that it yields to treatment, be it that it dies a natural death, it sometimes happens that by-and-bye the effects of the poison die out of the system and are no more seen; more frequently, however, the influence of the virus continues to be felt interpenetrating with lethal effect every tissue and organ of the body. The effects are universally felt because the cellular tissue, which is now its special *habitat*, is universally present, and on whatever spot it pitches it announces its presence by the same signs—a peculiar form of exudation. This exudation has more than one destiny—it may be entirely absorbed, it may liquefy into pus, it may degenerate into fat, it may harden into calcareous matter, it may be eliminated at the expense of the tissues which hold it; in its most typical form, however, it is of a gummy consistence, and this fact gives its name to the entire epoch, tertiary syphilis being otherwise known as the period of gummy products. Gummy products exhibit themselves under two distinct forms—circumscribed and diffused. In the first-mentioned the material forms a small mass varying from the size of a millet-seed to a walnut, quite easily distinguishable from the surrounding tissues; these formations are termed gummy tumours or gum-

mata; in the last-mentioned, the exudation has no distinct boundary, but forms a gummy layer among the tissues. Clinically, both forms are easy to distinguish from other exudations, and from the exudations of syphilis at an earlier date, and therefore constitute a sufficiently well-marked period; at the same time it must be admitted that, histologically, there is little difference to be made out between these products and the earlier manifestations of syphilis, gummata simply consisting of the elements of cellular tissue in every stage towards imperfect development or perfect retrogression. (*a*) It is during the evolution of tertiary syphilis that the blood is so profoundly affected that a syphilitic cachexia ensues—a condition occasionally accompanied, if not caused, by true leucocytosis. Little or no pyrexia accompanies the products of tertiary syphilis, which are always essentially chronic. Unlike, too, the products of secondary syphilis, tertiary syphilis is rarely symmetrical, and is infinitely less prone to be conveyed from one person to another; indeed, many good observers altogether deny its transmissibility, and regard it as a sequel of syphilis after the disease itself has passed away. On the other hand, there are arguments which are inimical to this doctrine, *e.g.*, gummata sometimes exist side by side with unmistakable evidences of secondary syphilis. Again, there is certainly somewhat strong evidence to show that tertiary syphilis *is* communicable through the blood and other secretions to a second person; histologically, too, the products of the two periods are undistinguishable, and, therapeutically, the disease still yields to the same remedies. It may be added that the want of symmetry is quite a common symptom of syphilitic manifestation during its period of greatest activity. Nor can any conclusion be drawn from the date of the symptoms; sometimes we find but a year or two elapse between the primary lesions and the tertiary symptoms, at others, intervals of ten, fifteen, and twenty years elapse. Very rarely cases occur where the secondary symptoms are altogether wanting; nothing intervening between the primary lesion and the period of gummy products. Leaving the question for the present, as one which has not yet been finally settled, let us proceed to consider further the phenomena of tertiary syphilis. We will notice the lesions of tertiary syphilis in the same order as we observed those of secondary syphilis, and first of all the skin and mucous membrane.

Skin and Mucous Membrane.—In the skin the syphilitic neoplasm, in its tertiary stage, either gives rise to a local sphacelus, whence results a deep ecthymatous ulcer (a form of lesion most common in early life and old age), or becoming imperfectly organised, dry tubercular masses may be produced. Both ulcers and tubercles are generally surrounded by a dark red discoloration which stains the skin for some distance, and in both there is a tendency to the free formation of crusts. Yielding to treatment, both forms of the disease leave deep and indelible scars behind, which often reveal to the observer the history of a bygone attack of syphilis.

In the mucous membrane the lesions are of a much more serious nature; they appear in the circumscribed and diffuse form. In the latter guise the gummatous products of tertiary syphilis are apt so to interfere with the nutrition of the part (the soft palate and neighbourhood are the favourite localities for these effects) that the whole structure dies *en masse*, *melts*, as it were, rapidly away. Laying bare the deeper structures, dissecting around or eating into vessels and even bone, the entire soft palate may disappear, or the carotid artery be opened, or extending to the back of the pharynx, may leave exposed the bodies of the cervical vertebræ. Such terrible catastrophes may ensue with few and slight general evidences of grave mischief, or perhaps with none, except some pain and difficulty in swallowing, owing to a prolapse of the velum pendulum palati. In the circumscribed form of gummata tertiary syphilis makes its presence evident in this region chiefly by the existence of gummy tumours, generally multiple in the substance of the tongue, and should these tumours slough or ulcerate keen observation and close inquiry are necessary to distinguish them from epitheliomatous ulcerations; this care is, indeed, the more called for since undoubted evolution of simple syphilitic ulceration into epithelioma occurs from time to time; thus, it happens that there is a period when anti-syphilitic remedies succeed, and another later period of the same lesion when such remedies must necessarily fail, and other means be resorted to for cure. Beyond the region of the mouth tertiary syphilis, when affecting mucous membranes, generally assumes the diffuse form, and may give rise to ulceration of the œsophagus, stomach, or intestines, or the exudation undergoing imperfect organisation, stricture of any of these parts may result. In the œsophagus and bowels, especially in the rectum, this is the commonest termination—a fair proportion of all strictures of these organs being due to syphilis. In the rectum, when the stricture is two inches or more from the anus, it is, as a rule, due to tertiary syphilis; but when met with lower than this, that is, close to the anus—a condition quite frequent in females—the lesion is associated with the earlier secondary symptoms, and not unusually is accompanied with condylomata.

Subcutaneous Cellular Tissue.—Tertiary syphilis often affects the cellular tissue without further invasion of the skin, and may appear either as a circumscribed or diffused exudation. In the circumscribed form, *i.e.*, as gummata, we meet with small movable tumours, often multiple (I have counted over 100 in the same subject), which, as a rule, are quite painless; they vary in consistence, being soft and semi-fluid when first formed, or when degenerating into fat or pus, hard and elastic when undergoing organisation. They may be absorbed or eliminated, and in the latter case, depressed cicatrices are left. They may be found anywhere, but the head, shoulders, chest, front of forearm, neck, scrotum, and nipples are the favourite situations. The diffused form of gummy exudation is rarer in the cellular tissue than the circumscribed variety: when it occurs large plains of areolar tissue may be invaded and may perish—the constitutional effect is of course excessively poor in such cases.

Under this head may be mentioned the hypertrophic growths of skin and cellular tissue which are occasionally met with in the neighbourhood or attached to the labiæ vaginæ. These formations, which I have seen attain a great size and weight, may develope from condylomata, or may be a true tertiary product; the former is, however, the more usual mode of origin, and in such cases other condylomata and small papillomata will be found associated with the large pendulous growth. In course of time the hypertrophic structure becomes pediculated, and will often continue to increase for years unless excised by the knife.

Bones.—If we limit the term tertiary syphilis, as we should, to the period of gummy products, we shall relegate the more acute cases of osteitis and periostitis to the period of secondary syphilis, reserving only the more chronic diseases for the tertiary stage. Diffuse gummy exudation, as a rule, terminates in necrosis; the low vitality of the product itself is insufficient for developmental purposes, while its presence checks and strangulates the vascular structures around. In this way large masses of bone may die peripherally or centrally, when the further history will be in every way identical with any case of necrosis from other causes. The cranium, the nose, the tibia, the clavicles, and the bones of the elbow are especially prone to be affected in this way. The margins of the necrotic portion generally become thickened, even to a marked degree, by a process of chronic osteitis, superinduced by the irritating presence of the dead portion. At other times the necrosis progresses along with absorption of the material which has caused the necrosis, so that the

(*a*) "Gummata consist of loose fibrous tissue, made up of pale elastic fibres, enclosing in their interspaces a homogenous granular substance, the elements of which are less adherent to each other than in deposits of true tubercle." Note by Lebert to M. Van Oordt's "Des Tumeurs Gommeuses." Thèse de Paris. 1859.

dead portion, when exposed, is dry, and as if worm-eaten (the term "necrosis eccentrica" has been applied to this condition), all the vascular canals being widened by absorption. Or, again, caries may be produced, rather than necrosis, though by an essentially similar chain of events. The circumscribed gummy tumours of bone may either organise into peripheral exostoses, or bony nodes, according as their base is broad or narrow; or if they attack the medullary canal may so interfere with nutrition of the bone as to give rise to a central necrosis, which often runs a singularly protracted course.

Cartilage.—Tertiary syphilitic affections of cartilage are not infrequent; by far the most important site of the poison in this stage is the larynx; the result of the condition we refer to is, as a rule, necrosis of the parts affected, which places the patient's life in extreme jeopardy. Tertiary affections of the larynx differ very widely from secondary affections; the difference may be stated aphoristically thus: Secondary syphilitic laryngitis is a slight affair readily yielding to treatment; tertiary syphilitic laryngitis is one of the gravest diseases, and generally terminates in death.

Muscles, Tendons, and Fasciæ.—Tertiary syphilis is apt to affect all these structures; gummous tumours are more common than diffused gummous exudation. These gummata, which are especially common on the muscles of the forearm, are often multiple, and give rise to few symptoms but pain—they are generally absorbed. Gummata of the tendons are easily made out, and likewise yield to treatment. Gummata of the fasciæ, particularly the palmar fascia, are apt to induce contraction, and the resulting deformity is often only to be remedied by free subcutaneous division of the bands of lymph, combined with general treatment.

Blood-vessels.—The blood-vessels are more subject to the attack of syphilis in its secondary than in its tertiary period; but if a gummous material be poured out it may induce aneurismal dilatation by the molecular death following the presence of the materies morbi.

The Viscera.—All the viscera are subject to the inroads of the syphilitic poison in its tertiary stage, and the symptoms produced are of course dependent upon the exact position of the gummous mass; thus, *e.g.*, in the brain gummata may give rise to any or all the symptoms of cerebral tumours—amaurosis, deafness, optic neuritis, aphasia, mania, paralysis of sensation or motion; in the *kidneys* all the symptoms of Bright's disease may be caused in the same way; in the liver a cirrhosis with sequential ascites, or icterus with scattered gummata may occur; if the blood be affected a true leucocythæmia may ensue, and so on. The *liver* is probably more often than any other viscus the seat of tertiary syphilis, and here the effect of its presence much depends upon the precise form which the exudation takes. If a diffused gummous exudation be poured out, we generally have a deformed and especially contracted liver, with an extraordinary development of cellular tissue in the site of Glisson's capsule. If gummata be the form assumed, they are often very numerous, of varying degrees of consistency, and stud the whole organ like little white turnips. Next to the liver, I should be inclined to place the *brain and spinal cord*. In both situations gummous tumours are commoner than diffuse gummous exudation. The tumours are rarely larger than a walnut, and the symptoms, of course, entirely depend upon their site. As they are met with in every possible situation it will be understood how almost every possible nervous symptom may result from their presence, the diagnosis only being arrived at by a careful historical search and attention to the effect of remedies. A few words must suffice for what further we have to say of tertiary visceral syphilis.

The *kidneys* are often affected by tertiary syphilis, when, as in the liver, an extraordinary development of cellular tissue takes place, which, by pressure, will induce albuminuria; the interstitial nephritis thus caused is always of a very slow and almost symptomless character.

If the *testes* be invaded, as they may be, the functions of the glands are often completely destroyed, and in this respect secondary orchitis, which scarcely ever leaves the glands damaged, differs notably from the tertiary affection—most frequently one gland only is diseased.

The *lymphatic glands* throughout the body are, as would be imagined *à priori*, favourite sites for the poison of tertiary syphilis. Under its influence they slowly and painlessly enlarge, sometimes remaining hard, at others softening into fat or pus. If the lymphatic glandular affection be very extensive, and especially if along with this diseased state the ductless glands suffer, a true leucocythæmia will ensue, which intensifies the syphilitic cachexia commonly seen in the tertiary stage to an extreme degree.

Gummata have also been found in the *heart*, but the diagnosis must always be very obscure, and they can scarcely be regarded otherwise than as pathological curiosities.

The Lungs.—I take the lungs last in order, as I think we have less positive evidence of the alleged syphilitic diseases of these organs being really of this nature. This is more true of the lung-tissue than of the air-passages. In the trachea and in the bronchi we meet with such precisely similar lesions as those in the larynx, which are confessedly syphilitic, that we have little doubt that they are due to the same cause. In such cases the symptoms will be those of a chronic tracheitis or bronchitis, as the case may be, and the real nature of the disease will, probably, only be inferred by its behaviour under treatment, or will be ascertained by post-mortem examination. In the lungs gummy exudations do occur, especially in the gummy form, where they give rise to a syphilitic pneumonia, which may be subdued by treatment, leaving cicatrices behind in the site of the old gummata. More rarely the exudation is of the diffuse form, and this, becoming organised, produces the hypertrophy of cellular tissue which we have mentioned as being so characteristic of the syphilitic cirrhosis of liver and kidney; when this condition obtains, we have what is termed a fibroid or syphilitic phthisis. The disease, however, requires further clinical study for its satisfactory elucidation.

SOME PRACTICAL REMARKS ON AURAL AFFECTIONS.

By H. Macnaughton Jones, M.D., M.Ch., F.R.C.S.I. and Edin.,

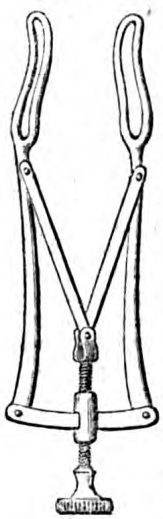
Surgeon to the Cork Ophthalmic and Aural Hospital, with Special Throat Department.

(*Continued from page 466, last volume.*)

Instruments useful in Diagnosis and Treatment.

Fig. 35.

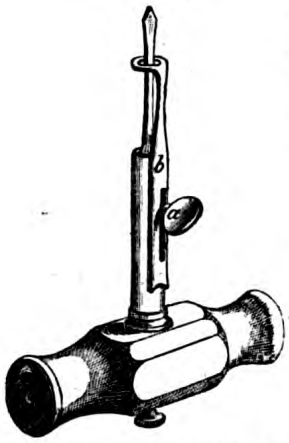
Fig. 36.



Thudichum's nasal speculum (Fig. 35) has been already referred to, but in some cases, especially when the nostril is irritable or tender, that form made by Weiss, shown in Fig. 36, will be found preferable, and gives a good view of the nares and turbinated bones.

To trephine the mastoid process it is necessary to have a guarded trephine. I have used the instrument shown here with satisfaction on a few occa-

Fig. 37.



sions. The guard (*b*) is regulated by a screw (*a*), and the depth to which we desire to pass the blade is thus limited. It is the aural trephine, devised by Mr. Hinton.

Removal of Polypi.

The rectangular forceps of Hinton already figured will be found in some instances a convenient instrument for removing polypi from the meatus and membrane. But the lever ring forceps of Toynbee here figured (Fig. 38) is the instrument I always use for this purpose, especially if the polypus is very small, or of the "mulberry" kind, and growing from the cavity of the tympanum or from the membrana tympani. There is no difficulty in using this forceps. Pressure applied to the lever (*a*) pushes ward the tube (*b*), and closes the serrated rings on the polypus. The patient is made to stand with the head inclined a little to one side; a large-sized speculum is introduced into the meatus, and the light well thrown into it with the spectacle mirror. An assistant may now support the head of the patient, and when a good view of the polypus is obtained, the forceps is carried steadily down to it with the rings slightly apart; the rings being now fairly opened the polypus is grasped by pressure on the lever and removed. The forceps, in the case of two or three polypi growing from the membrane or meatus, may have to be introduced some few times in order to remove the entire of the growth. If bleeding obscures the view, it is well to wash out the meatus and then dry the surface of the membrane or the bleeding part before re-introducing the instrument.

Fig. 38.
Toynbee's.

To illustrate the use of the lever ring forceps I may cite this case, which has recently come under my notice. A boy with complete perforation of the membrane in both ears applied for relief at the hospital. He had been previously subjected to treatment, and was under my care some years since, when he was threatened with brain mischief with severe otorrhœa. On syringing the left ear I perceived in the cavity of the tympanum, which was quite exposed, and growing from its roof anteriorly, a small tumour, quite white, on the surface of which I could distinctly trace vessels. I had never before seen a case of this nature, and at once suspected a cystic tumour growing in the tympanum. I made with a fine lance-headed knife an exploratory incision, and found that it entered easily into the mass. I now passed in a Toynbee's forceps and squeezed out the sebaceous contents, part of which came away with the forceps on withdrawing the latter. In order to ascertain the nature of the growth, I now again introduced the forceps, and closing the rings on the sac completely removed it from the cavity of the tympanum.

Often free syringing will bring away any loose portions of polypus not removed by the forceps. I have never had any hæmorrhage to speak of after removal of any kind of polypus. I generally use a little alum water if the bleeding is severe, and this is usually sufficient to control it. Occasionally it is not possible to remove the entire of one of these vascular polypi at one time, and we have to operate a few turns before the growth is cleanly extirpated. If the polypus is of larger size, globular or pyriform in shape, of the fibrous, gelatinous, or fibro-gelatinous kind, we must resort to other means of removing the mass. It is well in these cases to determine as carefully as possible before operating, the size, mobility, and seat of attachment of the polypus. This, as a rule, can be readily done with a probe. Most of the globular polypi which fill up the meatus are easily removed, with such a forceps as that figured here (Fig. 39); but the best instrument is the polypus snare of Wilde—the only difficulty which we meet with is the careful noosing of the polypus close to its attachment. This, however, is seldom a matter of difficulty, and will be found less so if the wire made for this purpose by Messrs. Weiss is employed. Having tried a variety of means, I have relinquished everything for this wire, which will be found quite strong enough for the removal of the polypus; at the same time that it can be easily moulded so as to encircle the mass.

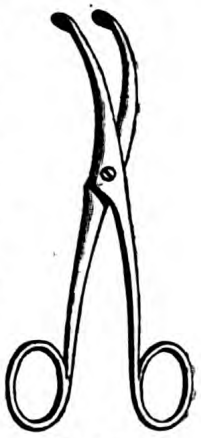


Fig. 39.

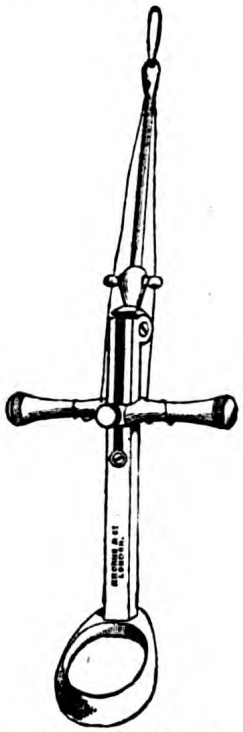

(Fig. 40) Durham's Modification of Wilde's Ear and Nose Polypus Snare.

The Use of Politzer's Bag.

In the Report in the Physiological Section of the Otological Congress Dr. Charles Burnett details some important conclusions which Prof. Lucæ has drawn regarding the condition of the pharyngeal orifice of the Eustachian tube during the act of swallowing. Prof. Lucæ does not think that during the act of swallowing the tensor palati opens the tube, but he rather inclines to the belief that "this muscle, right after the completed act of swallowing, participates in the re-opening of the tube, occurring simultaneously with the cessation of the action of the levator palati and the sinking back of the

velum." He explains how "the tubal muscles bring about a physiological ventilation of the ear. This ventilation of the ear is not brought about, according to this observer, by the opening of the usually closed tube at swallowing, but by the fact that the usually patulous mouth of the quite loosely closed membranous-cartilaginous tube is powerfully compressed by swallowing, and after the act is opened again."

Prof. Lucæ has thus found that we may blow air into the middle ear by employing a movement which will cause the velum palati to hermetically close the naso-pharyngeal space. *Such a process may be effected by a prolonged phonation of the vowel a*, which will cause the velum to rise, cut off the upper from the lower pharynx, and during this act air may be blown into the nares and thence into the middle ear by a powerful inflation with the hand-balloon." I have tried this experiment several times, and find that the ear is easily inflated during this act, and in a much simpler manner than by the old process of swallowing water.

Clinical Records.

WEST LONDON HOSPITAL.

Unilateral Anæsthesia—Complete Recovery under Treatment by the Electro-Magnetic Current.

Under the care of Dr. Thorowgood.

Notes by Mr. White, House-Physcian.

Charles F., æt. 30, a healthy looking, well-nourished, sergeant of the Mounted Police, was sent to the West London Hospital, by Mr. T. Holmes, on April 24, 1877.

He has been driving the police van, and during December was much exposed to wet and cold: to this he attributes his present illness. The symptoms commenced on December 29, 1876, with giddiness and pains in the head; there speedily followed gradual and complete loss of sensation over the whole left side, from the top of the head to the sole of the foot, unaccompanied by any loss of motion

On admission to hospital, April 24, he still complains of general headache and aching over the eyes with more or less giddiness; the pupil of the left eye is dilated. Examination of left side by a process of pinching, pricking, and tickling, fails to elicit any sensation whatever; and on putting some ink on the left side of the tongue patient declares himself quite unable to taste it, but on the right side he tastes it at once. There is now and then slight difficulty in swallowing, but the movements of the jaw are strong and normal. Both pulses are similar (72), tongue moist and clean. The 7th nerve seems in no way involved, for motion of face is normal, though sensation is quite lost. Prior to this attack the patient had lived temperately and enjoyed good health. He has never lost consciousness.

℞ Liq. hydrarg. perchloridi., ℥ss.;
Infus. gentian co., ℥j. ℿ t.d.s.

April 26th.—The interrupted current of the electro-magnetic machine was applied to arm and leg; at first no sensation and no reflex movements, but after the poles had been kept applied in one spot sensation gradually began to return.

28th.—Much complaint of pain at back of head and aching of eyes, pupil of left eye still dilated. Vision is dim. Conjunctiva touched without closure of eye—no stimulus being sent by the fibres of the 5th to the motor ones of the 7th.

About this date Mr. Bowater Vernon examined the optic discs, but did not detect any morbid change there.

May 8th.—℞ Liq. strychniæ, ℿiij.;
Acid phosphoric dil., ℿxij.;
Infus. gentian co., ℥j. ℿ t.d.s.

Battery current applied by Mr. White every other day with gradual return of sensation.

May 24th.—Complains much of dizziness of sight and headache; ordered a change of medicine.

℞ Potass. bromidi, gr. x.;
Tr. valerian. ammoniatae, ℥ss.;
Aq. camphoræ, ℥j. ℿ t.d.s.

June 1st.—Head symptoms much improved.

5th.—Sensation almost perfect, the only part where it is not much improved is the calf of the leg. Battery continued.

20th.—Sensation is established all over left side, not yet perfect in calf of leg. Head symptoms gone.

26th.—Ordered citrate of iron and quinine, and made out-patient. He feels quite well, head and eyes comfortable, slight impairment of sensation still in calf of leg. He is going now to return to easy duty.

Remarks.—The anæsthesia, with normal motion, coming on after fatigue and exposure to wet in this case was doubtless peripheral; though the persistent occipital headache tended to show some amount of central disturbance of congestive character. The small doses of perchloride of mercury were given first with a view to relief of congestion, and then the galvanic current, with small doses of strychnine, came in as useful agents in rousing dormant nerve function. In rheumatic anæsthesia from cold and wet, where the patient is young and temperate, a favourable prognosis appears reasonable, and such a prognosis was justified by the result of treatment in the case here reported.

HOMŒOPATHY PAST AND PRESENT.

Various circumstances familiar to our readers have lately directed the attention of the profession to the subject of homœopathy, and we have selected from many others two books published some years ago as pegs to hang some thoughts upon:—

1. "Homœopathy Unveiled." By W. P. Brodribb. London: Highley 1851.

2. "Homœopathy in Manchester contrasted with its alleged Principles." By William Roberts. London and Manchester: Simpkin and Co. 1862.

One deals essentially with Hahnemannism as it was practised and understood in 1851: the other with the same system as it was practised in Manchester in 1862, and in the latter we see foreshadowed the change which was silently taking place amongst the practitioners of the homœopathic school, until it has culminated in 1877 in the eclecticism of such disciples as Dr. Wyld.

It may be asked—What is the use of reviving these works? What is the good of again going over the beaten track of refutation?

It is quite true, as Mr. Brodribb says—

"At the very threshold of our inquiry into the truth of homœopathy we meet with assumptions so gross and pretentious, so extravagant, as to render investigation absolutely puerile and absurd."

The vitality of error and fallacies is very great—the same ground has generally to be gone over, but we believe these books will prove interesting as showing that our profession has devoted some attention to the subject in the past—that the principles of Hahnemann have been studied, weighed in the balance of reason and justice, and found wanting—facts confirmed by the verdict of the present age.

We need not linger long over Mr. Brodribb's pamphlet, as it was confined to the unveiling of pure Hahnemannism; but as this system is now openly abandoned—as the globular, the dynamic, the infinitesimal, the psora theories are ignored by the modern homœopathic school (*vide* homœopathic journals, lectures of this year, *passim*), we mention it, using the words of the second brochure under notice, as—

"*Un memoire pour servir*, that one day will be welcome to Dryasdust when he shall sit down to write the history of homœopathy."

Dr. Roberts' work is of more modern date, and has, as we have said, a deeper interest, as it indicated the wave-thought that was insensibly undermining the weak fabric on which Hahnemannism rested, and as it is a most thorough *exposé* of what then was secretly practised under the guise of homœopathy, The author tells us what Hahnemannism was, what Hahnemann believed when he founded his school, what the tenets are as put forth in guides, working-mens' guides, hand-

books, stepping-stones, text-books; and what the public and our profession imagined was pure homœopathy. He says—

"I have small desire to break a lance with Hahnemann or any of his consistent disciples, but it has come to my knowledge that the practice of homœopathy is as wide as the poles asunder from the teaching of the books, and from the current belief concerning it."

Might we not use similar language at the present day? He was put on the scent by finding an epileptic patient was being *homœopathically* treated with *three grains of phosphate of zinc*, three times a day, and that this was not a solitary instance, but a sample of systematic practice. We think it would be a pity to give our readers too many extracts from this clever, temperate, concise, logical, masterly *exposé*. We must refer them to it, and trust that it may still be obtained, and if not in print it would be well worth reproducing: even without any change it is equal to the requirements of the present day.

We shall give another extract anent our supposed persecution of homœopaths.

"Another delusion is a notion that homœopathists are a persecuted body of scientific men; much dust and clatter has been raised there anent. It is an excellent thing in these days to be even really persecuted, and still better to obtain the credit of it without the *désagremens;* and this the homœopathists have managed to do.

"Homœopathists have wilfully separated themselves from regular practitioners by laying claim—with what justice has been seen in the foregoing pages—to a wholly different and exclusive mode of treating disease; and if we refuse to acknowledge them as professional brethren it is because there is a profound suspicion throughout the profession that what goes under the name of homœpathic practice is a sh——well, an unreality—what men of business would call a 'trick of trade' to catch the breeze of popular favour. To have condoned the movement would certainly have checkmated some who now grow fat on public credulity; it would also have gained for the profession a transient reputation for liberality, but it would have been neither an honest nor a dignified course."

We must mark the following significant and prophetic words—

"And when 'fuit' shall have been written across the history of homœopathy, those who now are ready to charge us with prejudice will then be compelled to approve our constancy."

The British Medical Association will shortly meet in Manchester. The subject of homœopathy will come up, if not in an official form, certainly in social intercourse, and we would advise our readers before that time to obtain the little work of Dr. Roberts. The Wyld-Richardson correspondence presents us with the latest phase of homœopathy.

It originated in a well-meant and benevolent attempt to bring about a reconciliation, but we may fairly express our surprise that any logical minds could entertain the idea of an amalgamation of two such opposite schools, presuming that the basis of their existence was fully understood. It is needless to recapitulate the details, as they must be familiar to every medical man.

The monthly *Homœopathic Review*, July 2nd, 1877, a representative organ, has devoted most of its columns to the correspondence, and a special editorial sets forth the pretentions of the school, and defines what homœopathy really is—a very much wanted and desired piece of information.

The editors assure us "that they are not surprised at the misrepresentations of homœopathy—those cunningly designed fables which emanate from the allopathic medical press—that there are but very few who have any belief at all in those teachings of Hahnemann which are constantly paraded as true homœopathy by their adversaries."

We are thankful for the courteous imputation, and for this candid confession, which we hope will be acceptable to the Laurie's, the Hempels, the Morgans, the Sharps, the Wylds of homœopathy. We were wrong, it seems, in drawing fair deductions from their published writings, and in attributing to them a knowledge of the meaning of words and of the English language.

The medical press and medical writers have examined the literature of homœopathy, have sought for information even at the fountain head Hahnemann, and they found "fables" (we thank the editors for the word)—more than fables—in the language of Hempel (*Organon*, p. 131) "a tissue of fallacies, illusions, misapprehensions, absurdities and childish observations."

The "text-books" designed to popularise this system, written by earnest and *scientific* (?) homœopaths, abound in the most extravagant doctrines, and in directions for the treatment of disease both puerile and dangerous.

We could give instances without end; one from Dr. Laurie's "Homœopathic Guide for Family Use" will suffice—*ex uno disce omnes*:—"Croup. Hepar. sulph. is good in the earliest stage before fever sets in, when the cough is hard and dry, or hoarse, or hollow, and accompanied with wheezing; it is also useful in the more advanced stages, when there is constant rattling of phlegm, excessively quick and laborious breathing, and when the patient frequently grasps at the throat and throws the head back.

"*Dose.*—In the early stage disolve four globules in two tablespoonfuls of water, and give a tablespoonful of the mixture every three hours; in the advanced stage dissolve twelve globules in three tablespoonfuls of water, and give a teaspoonful of this mixture every half-hour."

Could any language too strong be applied to the above? puerile, dangerous, are mild terms. Might we not add the word criminal in application thereto?

But now let us see what homœopathy is, according to the definition of the *Monthly Homœpathic Review;* but we must remember at the onset that it is not the homœopathy of general practice..

"1. True homœopathy consists simply and solely in the prescribing for disease such remedies as are competent to produce a similar disordered state of health in a healthy person. This alone is homœopathy.

2. To carry out homœopathy it is necessary the drugs be proved on persons in health.

3. It is further necessary that the amount of drug given to cure be less than that required to produce disease.

4. And finally it is requisite that medicines should be given singly and uncombined with others.

These are the corollaries of homœopathy. They are inseparable from it; no one can satisfactorily practise homœopathy without seeing their necessity, or availing himself of them, and *so far as we are aware* no one attempts to do so."

We may observe *en passant*, before taking these four points *seriatim*, that the editors must not have read Dr. Wyld's letters, or they would be aware that he does not agree with these conditions, although he is a homœopath and a vice-president of a society to which Drs. Pope and Dyce-Brown belong, so that we have here a difficulty as to whether we can accept the propositions as the fundamental principles of the system. But let that pass and let us assume they are.

We must admire the marvellous coolness and effrontery with which the regular medical press is charged with inventing fables—the open confession of abandonment of pure Hahnemannian doctrines, for which these four propositions are substituted.. We need only briefly dwell on them, as they have been again and again refuted and proved fallacious. The first proposition rests on the very important assumption that medicines given to healthy persons do produce symptoms resembling those of natural disease, and this is a postulate universal in homœopathy. It is an assumption of only very limited truth, and if carried out would be often most disastrous, and when it is true is of very little practical value. For instance, belladonna produces symptoms somewhat resembling scarlatina, and is a homœopathic remedy for the disease, but we know that drug has not the least power to cut short its duration; this has been tested repeatedly and extensively. Again, opium produces lethargy, coma, and insensibility. Ought not opium then be the remedy?

We need not go into this point, but refer our readers to Dr. Robert's Work, page 32.

2. The provings of homœopathy are a mere chimera and fiction, and we may imagine what fertility of imagination must have existed in the minds of homœopathic writers when we are told that natrum muriaticum (common kitchen salt) produces in a healthy person over four hundred symptoms; that silica, calcarea, carbonica, alumina, sulphur, charcoal, and other substances which we are in the habit of taking with our food and the air we breathe have equally injurious influences.

Well might Dr. Charles Julius Hempel, Homœopathic Professor, Author, Translator, and Editor, say—

"The provings are exceedingly unreliable and illusory" (see Hempel's *Organon*, p. 125).

The third proposition depends on the truth and accuracy of the foregoing one, and as we have seen that is unreliable, the corollary must also be unreliable, whilst it also opens out a very wide discretionary limit as to what should be the dose.

This has always been in the past a stumbling block, some, as Dr. Epps, trusting to infinitesimals; others, as the Manchester homœopaths, to palpable quantities.

The fourth law is a pure Hahnemannian one, and we are glad that the father of the sect has not been altogether discarded. We would not object to this if the other propositions on which it is dependent were true; we desire by all means to cure *cito tuto et jucunde*, but unfortunately we cannot. Homœopaths have not adhered to this law in the past, and we feel certain they will do so less in the future. We must here conclude, though we have left many points untouched, but we have pointed out the source whence information may be obtained.

It is a matter of regret that we have to contend with so much ignorance and obstinacy, but there have been men in every age who have believed in the most outrageous, doctrines; visionaries who have secured ardent followers; who for a time have had their brief little day, and then been forgotten, whilst the truths they opposed lived on.

Hahnemannism has had its day; the "FUIT" will surely be written across its history, while scientific and legitimate medicine, wedded to no therapeutic law, but guided by experience, will prosper and flourish in discharge of its great mission, the relief of human suffering.

INTERNATIONAL CONGRESS OF MEDICAL SCIENCE.

THE Fifth Session of the above-named Congress will be held at Geneva from the 9th to the 15th September.

It embraces all the departments of medicine, and the subjects selected for discussion in each section seem well chosen and well worthy of attention, as may be seen from our analysis.

SECTION I.—MEDICINE.

President—Dr. Strœhlin. Vice-Presidents—Drs. Ducellier, Duval, and Revilliod. Secs.—MM. Saloz and Vincent.

1.—The etiology of typhoid fever. Dr. Bouchard.
2.—Resumé of observations and works of simple chronic ulcer of the stomach. Dr. Lebert.
3.—Diphtheria, croup, tracheotomy. Dr. Revilliod.
4.—Universal pharmacopœia. Prof. Gillé, Brussels.

Communications announced:

1.—Parasitic affections of the skin. Dr. Hardy.
2.—Inoculability of various skin affections (ecthyma, impetigo, herpes, epidemic pemphigus of the newly-born). Dr. Vidal.
3.—Diagnosis of meningitis by the ophthalmoscope. Dr. Bouchut.

SECTION II.—SURGERY.

President—Dr. Mayor. Vice-Presidents—Drs. Julliard, Las Kowstri, and Speiss. Secs.—Drs. Hilt and Martin.

1.—On artificial ischemia. Dr. Esmarch, of Kiel.
2.—The influence of traumatism on pregnancy and *vice versa*. Dr. Verneuil.
3.—Treatment of ozæna. Dr. Rouge, Lausanne.
4.—Galvano-cautery. Dr. Julliard, Geneva.

Communications announced:—

1.—The definite results of articular resections. Dr. Ollier, Lyons.
2.—Penian fistula. Dr. Reverdin, Geneva.

SECTION III.—MIDWIFERY.

President—Dr. Gautier. Vice-Presidents—Drs. Badan, Long, and Odier. Secs.—Drs. E. Cheneviere and Pilicier.

1.—On the artificial alimentation of children. Dr. Zweifel, Erlangen.
2.—The employment of anæsthetics during natural labour. Dr. Prachaud, Geneva.
4.—On membranous dysmenorrhœa. Dr. Gautier.

Communications announced:—

1.—Uterine souffle. Dr. Rapin, Lausanne.
2.—On the law regulating the growth of children. Dr. Odier, Geneva.

SECTION IV.—PUBLIC MEDICINE.

President—Dr. H. Cl. Lombard. Vice-Presidents—Drs. Bient, Dunant, Olivet. Secs.—Drs. Lombard and Pétavel.

1.—The influence of alcoholism on mental affections. Dr. Magnan.
The progress of alcoholism, the pernicious influence it exercises on the individual, his descendants, imposes the necessity of its study upon all—the hygienist, the physician, and the surgeon.
2.—Medical geography. On malaria in Europe and Northern America. Dr. H. Cl. Lombard.
3.—On the influence on towns by emigration of the inhabitants of villages. Dr. Dunat.
4.—Tuberculosis treated on the mountains and on the Mediterranean coast. Dr. Thaon, Nice.

Communications announced:—

1.—The influence of the adulteration of alcoholic drinks on the health of the manufacturer and consumer. Dr. Guillaume, Neuchatel.
2.—How epidemics arise and end? Prof. Diday, Lyons.
3.—On the value of hydropathy in the nervous state and anæmia. Dr. Glatz, Geneva.

SECTION V.—BIOLOGY.

President—Dr. Schiff. Vice-Presidents—Drs. H. Fal, Rapin, Vulliet. Secs.—MM. Vogt, Darier, Wartmann.

1.—The physical characters of the electric discharge of the torpille (cramp. Fub), its physiological analogy with muscular contraction. Dr. Marey.
2.—Cerebral localisation. Dr. Broadbent, London.
3.—On the cause of sleep. Dr. W. Preyer, Jena.
4.—The functions of the spleen. Dr. Schiff.
5.—Histology of the ova and the *role* of the zoosperim in fecundation. Dr. H. Fol.
6.—Physiological antagonism. Dr. Prevost.

Communications announced:—

1.—Entozoa in man. Dr. Vogt.
2.—On the tissues in the organism. Dr. Yalsy.
3.—Case of anomaly in conformation of the hand. Dr. Boechat.

SECTION VI.—OPHTHALMOLOGY, OTOLOGY, ETC.

President—Dr. Warlomont. Vice-Presidents—Drs. Barde and Haltenhoff. Secs.—Drs. Ferriere. Ravenel, and Kohler.

1.—Indications for the enucleation of the globe of the eye in its relation with sympathetic ophthalmia. Dr. Warlomont.
2.—The etiology and prophylaxis of myopia. Dr. Haltenhoff.
3.—Tenotomy of the tensor tympani. Dr. Colladon, Geneva.

SECTION VII.—EXHIBITION OF INSTRUMENTS.

Directors—Drs. Julliard and Reverdin.

It will be seen that though this congress is international, yet only one English name is to be found in the list of contributors. The committee have issued a prospectus of the proceedings, with a very interesting analysis of the heads of the various questions under discussion, in French and German.

Would it not have been as well if they had also been set forth in the English language, for though it is presumed that no one would attend the Congress without knowing French, there seems as much reason for having a *resumé* in English as in German. It is not too late to remedy this, and we believe it would add to the success of the meeting.

All particulars connected with the reading of papers may be learnt from the general secretary, Dr. Prevost, No. 8 Rue Eynard, Geneva. Would it not be desirable to appoint an English secretary? This Congress must be also interesting to our American *confrères*. Are there any secretaries there?

THE deaths registered in London last week were 20 per 1,000 of its population. Dublin gave the same death-rate, Edinburgh 18, and Glasgow 22 per 1,000. Brighton was the lowest on the list of large towns with 9, and Salford highest with 25 per 1,000.

A 'CUTE Yankee has succeeded in making sham salmon which finds a ready market in the poorer parts of London. It is put up in tins and branded just like that which is real and good. The fish itself is believed to be cod, or some inferior kind, coloured and flavoured to imitate as far as possible the genuine article.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 18, 1877.

RELATION OF STATE MEDICINE TO INTEMPERANCE.

IN the last part of the *Journal of Psychological Medicine* there is an interesting paper on this subject by Dr. Edward C. Mann, medical superintendent of one of the asylums, New York; from which it would appear that intemperance is on the increase in America, as well as in this country. In New York it is estimated that 33⅓ per cent. of all deaths are due, directly or indirectly, to the abuse of alcoholic stimulants, of which it is supposed that 600,000,000 dols. worth are annually sold in the United States.

We are also reminded that insanity from intemperance is on the increase, especially in England. In one of the largest asylums (the Crichton Royal Institution) the admissions due to intemperance have risen, during the last five years, from 8 per cent. to 35 per cent.

With regard to the remedy, Dr. Mann very judiciously observes that the wisdom and intelligence of the Legislature should be directed towards the diffusion among the masses of the knowledge of sanitary and hygienic laws, and the penalties consequent upon their violation. The public sentiment must be enlightened and changed before prohibitory laws and statutes will avail. When the masses can be made to understand that by intemperance they are not only destroying their own health, but also that of their offspring, then, and only then, will the disease—for disease it is—be abated.

We are glad to see that Dr. Mann agrees with us in thinking that much good may be done by the establishment of inebriate asylums, and by the passing of such laws as would enable the public guardians to put into active operation remedial restraint; but he goes so far as to say that inebriates should be committed in precisely the same manner as are the insane, and held for treatment until the superintendent deemed them fit to take their place in society.

"There should be," he remarks, "no half-way or sentimental measures adopted in the confinement and treatment of inebriates. The public must understand that inebriation is a type of insanity, and that in all cases prompt and effective measures must be taken to prevent such individuals ruining themselves and injuring society. . . . It must be understood that the inebriate is suffering from a physical disease, and that he is committed to an inebriate hospital to stay until cured, whether that cure takes six weeks or six years."

Our own opinion on this point has been given on a previous occasion, and therefore it is scarcely necessary to say that, although we are in favour of the compulsory control of habitual drunkards, we neither regard habitual drunkenness *per se* as a physical disease, nor as a "type of insanity." That it leads to disease and insanity is too well known, but that it is in itself the effect of a physical disease, or a manifestation of insanity, has always appeared to us a proposition that could only be maintained by those psychological physicians who allow their judgment to be biassed by their own peculiar studies. Not only may such teachings be regarded as contrary to the general meaning and acceptation of the term "insanity," but if carried to their logical conclusion, as Dr. Mann would have us do, they would render any legislative attempts to control habitual intemperance quite impracticable.

"For the successful treatment of inebriety," he remarks, "as with insanity, it is necessary to send the patient for treatment in the early and curable stage of the disease." This is perfectly logical, and consistent with Dr. Mann's view of the subject; but what does it amount to? It amounts to this: that the parents of a man who has given way for a short time to intemperate habits are to have the power of sending him to an asylum, to be treated as a lunatic!

Could such a doctrine be for one moment tolerated, much less put into force, by any society whatsoever? It will be long before either the American or the British public will listen to such a proposition as this. The compulsory control of the confirmed inebriate is a proceeding of which the public will, probably before long, take a favourable view; but the compulsory control of the inebriate, who is but in the "early and curable stage of the disease," much less his forcible detention in an asylum as a lunatic, is a measure which the profession would never think of recommending, and a measure to which the public would always entertain the greatest aversion.

If there is one thing more certain than another in the consideration of this great question, it is that no government in this or any other country could base its legislation on a view of the nature and causes of intemperance, which is for the most part purely hypothetical, accepted only by a small majority of the profession, and repudiated by public opinion.

The Bill that will shortly receive the consideration of the English Parliament, is very properly not framed on the presumption that habitual drunkenness is a disease or

a form of insanity, but on the fact, which few will deny, that it is a vice which often leads to insanity, that it is the fruitful parent of much domestic misery, poverty, disease, and crime, and that such an act as that contemplated is very desirable both from a political and social point of view, and would bring relief to many a miserable household, and greatly mitigate and prevent the manifold evils which result from immoderate indulgence in intoxicating liquors.

Nor must it be forgotten that the direct interference of the legislature is only one means of dealing with this great national evil; and that, if we wish to make the people, especially the working classes, more sober, we must endeavour, as we are now doing, to offer them some healthy counter-attractions to the beer-shop and the gin palace, to educate them in such a manner as will foster among them a sense of their own dignity as men, a spirit of self-respect, and, as Dr. Mann well remarks, diffuse among the masses a knowledge of sanitary laws, and of the penalties consequent upon their violation.

THE SOCIAL STATUS OF THE PROFESSION IN IRELAND.

We have read with unmeasured disgust and humiliation the newspaper reports of a fracas between two doctors at Listowel, in the co. Kerry, one of whom has been in danger of his life from an assault worthy in brutality of Stoke-upon-Trent, and one of whom is under bail to stand his trial for being party to said assault. The fight it appears, arose out of a discussion which took place in a common public house, where these members of our profession were drinking side by side with the *canaille* of their own constituencies.

We deeply regret to be obliged to say that the presence of medical men in such places is neither unusual nor considered dishonourable, and we are, furthermore, obliged to express our belief that the low social disposition which our profession has come to occupy in some districts in Ireland is mainly owing to the admission of persons to its ranks who have never occupied the position of gentlemen.

By the agency of the cheap universities, and by the facility which government grants afford for giving a cheap and low class medical education, doctoring has been brought within the easy reach of the sons of cotter farmers, small shop-keepers, and even of working artisans and thus it happens that boys who have been brought up in association with the public house are to be found there only too often when they have reached the age of men and the rank of doctors. It was, on a recent occasion, publicly stated by a provincial medical practitioner, whose name carries respect with it throughout Ireland, that there were but two of his professional brethren in the Poor-law service within his district, whom he would desire to see as guests in his house, and we were entertained on the same day with a description by a medical man, of his attendance on a sick medical student, of one of the provincial colleges, who lay in fever in the loft of a small farmhouse which he shared as a bed room with two of his fellows. We are far from implying that most or many of the Irish provincial practitioners are of the social rank to which we refer. It is not so now; but, if the remedy for the present state of things does not come soon, if the selling of university degrees at the same rate as druggists licenses is not put a stop to, the practice of medicine in the Irish provinces will, before the century ends, be a pursuit unsuited for a gentleman.

THE REVIVAL OF BLOOD-LETTING.—II.

We should have stated a fortnight ago our reasons for writing on a subject to which the profession has for many years past given very little attention. We shall now, however, proceed to do so, and shall mention as briefly as possible the circumstances that have led us to give expression to opinions which we have long entertained.

In the first place, readers of our periodical literature cannot have failed to notice how many cases have been recently reported in which more or less benefit was derived from the employment of local or even general depletion.

Several cases have been reported in the Medical Press in which venesection proved of the greatest service; and many more will be found scattered through the columns of other medical journals. The same may be said in respect of some of the medical works that have recently issued from the press. The very last that came under our notice was one in which the application of leeches or venesection was more than once recommended for the disease which formed the subject of the work.

But what has chiefly attracted our attention is an interesting and suggestive paper in *The Glasgow Medical Journal*, by Dr. Robert Kirk, of Glasgow, on uræmia, with cases of scarlatinal dropsy, treated by blood-letting. The first case was that of a young man who, after a slight attack of scarlatina, was attacked with frequent convulsions. The attacks became very strong, and nearly continuous, with tonic and clonic spasms, and occasional stertorous breathing. In one of these there were violent convulsions, unconsciousness, foaming at the mouth, with dilated pupils. He was at once bled from the arm to sixteen ounces, three men holding the patient during the operation. The fits ceased almost immediately, a sort of comatose sleep alone remaining. This was about eight p.m. Next morning, at six, he awoke, said he felt well, and took some food. The wound, moreover, had burst open, and he lost a good deal more blood, but his pulse was of the natural standard, and he was not the worse for the loss he had undergone. Diuretics were then administered, which brought away plenty of albuminous urine, loaded with lithates; he was discharged at the end of six days, and when seen six months afterwards, he was in the best of health, and not at all anæmic. Another case—a very bad one—appeared to show the good effect of local blood-letting in acute pulmonary œdema. Again, a boy at ten, is seized with violent convulsions, with only brief intermissions. Ordinary treatment is of no avail. He is bled from the arm to twelve ounces. The fits immediately cease, and sleep supervenes, from which he wakes up apparently well, the urinary secretion is restored, and his health rapidly established.

In another case twelve ounces of blood was abstracted before it assumed a serious aspect. There had been dropsy for eight days, with albuminous urine. In a few days

after the venesection the albumen and smoky colour left the urine, and at the end of ten days he was quite well. Lastly, a girl, aged nine, was comatose after scarlatina, with puffed, pallid face, teeth clenched, a little foaming at the mouth, pulse 140, pupils moderately contracted and insensible, rapid oscillation of the eye-balls. The case appeared a very unfavourable one, but about twelve ounces of blood were drawn from the arm, and in four or five hours after the pulse had fallen from 160 to 80; she fell into a natural sleep, and ultimately recovered. In every case in which Dr. Kirk has tried blood-letting in scarlatinal dropsy, it has proved eminently successful; and he would not hesitate to try the remedy again, "in preference to a farrago of sudorifics, diuretics, and purgatives, having always the lancet in reserve in case of danger." Nor is he quite singular in his practice, for it appears that Dr. Bramwell of Perth, published in the *Edinburgh Medical Journal*, for July, 1875, a notice of 32 cases of scarlatinal dropsy, in which he frequently had recourse to general abstraction of blood, with the result of only one death out of the 32 cases, and that a case which was seen too late for treatment to be of any service. Amongst his cases were some of both pulmonary œdema and convulsions, in the treatment of which he resorted to depletion with unequivocal success, whether it was practised at any early stage, or not until those complications set in. He also generally found, as did Dr. Kirk, that free diuresis set in 48 hours or less after blood-letting.

But the discussion which took place on the subject at a meeting of the Glasgow Medico-Chirurgical Society, was still more significant of the change that is taking place in the opinion of the profession with regard to the efficacy of blood-letting as a therapeutic agent, while at the same time valuable evidence was adduced by some of the members of this society in support of their opinions, and in favour of this method of treatment. In one case of scarlatinal dropsy, said Dr. Richmond, of Paisley, in a child two years old, there was a total suppression of urine, with great dyspnœa, &c., and the case seemed hopeless. Bleeding eased the respiration, but the secretion of urine did not return. A second bleeding, however, not only gave additional relief, but restored the secretion, and the child made a good recovery. In another case he gave the ordinary treatment for scarlatinal dropsy, but being sent for in great haste, and finding the child in convulsions, he bled him "very copiously, with immmediate relief to the convulsions." In his opinion these patients stood depletion uncommonly well; no mode of relief was so certain as copious bleeding in these cases, and attended with so little bad effects afterwards. Dr. Hugh Thomson related a case of scarlatinal dropsy, during the treatment of which the child became suddenly worse. He was gasping for breath from congestion of the lungs, and he seemed at the point of death. He at once opened a vein from which the blood came away freely, and the result was, that the secretion of the kidneys was well established, and the child made a good recovery. Dr. Morton said he had seen several forms of modern "revival," but he believed that one of the most sensible would be the resuscitation of the practice of venesection in several acute maladies. The President, Dr. Watson, referred to the successful employment of blood-letting by his father, and to the fact that he himself was a living example of the utility of this mode of treatment in scarlet-fever. There was no doubt that they had too thoroughly given up blood-letting. In proper cases, and within proper limits, the treatment was most effective. Into the general theory of the matter he could not enter; but he thought that the arguments of Dr. Bennet being founded on a view far too limited, were essentially fallacious. Several other members gave similar testimony, and even Dr. Gairdner, although more guarded in his praise of this remedy, admitted that Dr. Kirk was fully entitled to claim for the bleeding treatment some of the results in his cases. There was, he said, quite a catena of evidence that in a great many cases bleeding proved more successful than any other remedy.

Notes on Current Topics.

Coroners' Inquests.

At the last quarterly meeting of the Scarborough Town Council it was resolved that a committee be appointed to consider how far the law regulating the holding of inquests in this borough necessitates such inquests and sanctions such customs as are now in vogue, and to recommend such action for their future holding as may seem to them wise and practical. Considering, however, it is the intention of the Government to introduce into Parliament a measure dealing with the subject of coroners' inquests, and proposing an important amendment in the existing law, the committee very properly refrained from submitting any lengthy report on the matters referred to them. They thought, however, that the present proceedings in connection with the holding of inquests might be considerably improved, and in accordance with this opinion they submitted the following suggestions:— 1. That the Coroner should submit to the Council in his quarterly accounts the names of all medical and other professional witnesses attending inquests. 2. That jurors should be summoned by precept from the constable instead of *viva voce* as is at present the practice. 3. That as far as practicable inquests should be held away from public houses, and that a reasonable sum should be allowed by the Council for the hire of the necessary rooms and for lighting and heating the same. 4. That the Coroner's office should be paid by salary in lieu of fees. 5. That the Coroner's officer should give notice of all inquests to the representatives of the press. They also expressed the opinion that due care should be observed by all concerned in order that inquests may be obviated except in cases where circumstances imperatively demand an inquiry. There is not much fault to be found with these recommendations, the most important of which—the third and fourth—have been often urged before by the medical press. That the coroner's office will be paid by an annual salary in lieu of fees will no doubt be eventually the case. The original intention of the Legislature, in paying the coroner by fees, was that he should be tempted to hold rather too many than too few inquests;

and it is questionable whether, if the salary system be adopted, he may not, on the principle of not doing more work than he is obliged, be occasionally induced to pass over some cases in which an inquest is highly desirable. He knows that his salary will be the same whether he holds many or very few inquests, and strong would be his integrity if he were never lax in the performance of his duties. On the whole, however, the salary system is the better of the two, as any abuse to which it is liable would be counteracted by the action taken by the medical men, whose interest it is not to give a certificate of death where there is any doubt or suspicion as to its cause ; at least, so the above committee would have the public suppose, for, alluding to the large increase in the costs, Mr. Whittaker remarked that these costs were not so much to be attributed to the action of the coroner as to the action of the medical men. There had been, he said, many cases in which medical men might have justly and honestly given certificates of burial, but did not do so. We are afraid that this insinuation is not wholly unfounded, for when we hear of practitioners attending patients for sixpence per visit, could we wonder if we heard of their urging the holding of coroners' inquests, more for the sake of getting one or two guineas than for any desire they have to satisfy the ends of justice? We must, however, take a hint from the Scarborough committee, and say no more about the subject until it comes up for discussion in the House of Commons.

The Life Cost of Filth in Dublin.

THE filth of the City of Dublin, the want of proper drainage, the disgusting condition of the river Liffey, and the poisonous condition of the houses of the poor—for all of which the Corporation are mainly responsible—has caused the death-rate of the last quarter to exceed by nearly one-fourth that of any of the large English towns. The proportion stands as follows :—

Dublin	30·0 per 1,000 of population.	
Glasgow	26·6	,, ,,
Edinburgh	22·5	,, ,,
London	22·1	,, ,,

The average death-rate of the other English cities was, therefore, 23·75 per 1,000, or 6·25 below the Dublin rate. The Dublin mortality, it should be remembered, is calculated upon a district which includes Kingstown and the other suburban districts, and would be considerably higher than 30·0 per 1,000 if calculated for the city proper. Taking it, however, at the least estimation, and counting the deaths at 2,361, as stated in the Registrar-General's Report, a simple calculation enables us to state that the citizens of Dublin have paid for the incapacity of the sanitary authority, a fine of about 500 (495) deaths over and above those which must inevitably occur in such a city as Dublin. These 500 lives occurring mainly amongst the working-classes, one of whose deaths represents usually the pauperism of their families, may be taken to signify the creation of very many widows and of innumerable pauper children—grave reinforcements of the workhouse population, and further increase of misery and poverty. Space does not permit us to go further into the calculation, but common sense enables us to say that the incompetency of the Dublin Public Health Committee is directly and unmistakably responsible for a fearful annual loss of life and money, even if misery and the discomforts of poverty be disregarded. The largest outlay on sanitation which could be conceived to be necessary would, undoubtedly, be repaid to the citizens cent. per cent. in hard cash, if only it could be made certain that the expenditure would be rightly applied. This is exactly what cannot be made certain as long as the Corporation and the public health section of it are what they are, and, therefore, no alternative presents itself but to continue to pay the annual toll in death, disease, and discomfort until the citizens can be awakened to the necessity of reforming the Town Council.

At the last meeting of the Executive Committee of the Dublin Sanitary Association, it was stated that two cases of typhus and a case of cerebro-spinal meningitis were under treatment at present from a house which was reported by the Association to the Public Health Committee of the Corporation in July, 1873, as being unfit for human habitation, having always been a hotbed of disease. It was severely visited by cholera in the year 1866, furnished three cases of fever to hospital in 1869-70, seven cases of small-pox in 1871-2, and at that time (1873), had two cases of enteric fever. Three members of the Public Health Committee then visited the house and reported that the complaint of the Association was unwarranted by facts. Notwithstanding, it is still allowed to remain ; although once, unfortunately, it narrowly escaped being burned down—a plague-spot in the city and a disgrace to the sanitary authority.

The Works of Aristotle.

SOME very curious revelations were brought out last week, in an action for the recovery of indenture money by William Nicholson and Sons, printers and publishers, of Wakefield, Yorkshire, who sued the father of an apprentice for £50 damages, alleged to have been sustained by the plaintiffs in consequence of the defendant's son having absconded.

Most of our readers are no doubt acquainted with the genuine works of Aristotle, but we now learn that his name is prostituted on the title page of another book of an obscene and disgusting nature, and that this book is published by a firm (Nicholson and Sons) priding itself on its reputation for the production of theological works?

We have in our recent articles on the "Fruits of Philosophy" said enough about the evils arising from the dissemination of such literature, and would hardly advise another prosecution, although to our minds the publishers of such obscene books thoroughly deserve it. Of course, the defendant had rendered himself liable for the cancelling of his son's indenture, but the grounds of his defence were, bad treatment, the publication of obscene books by the plaintiffs, and the consequence corruption of his son's morals. Upon this count plaintiffs pleaded the reputation of their firm as a guarantee against obscenity. But they admitted that the work was not by Aristotle, that it was not written by any medical man, that they could neither keep their apprentices nor the women folders from reading it, and that they didn't put their names to the book although thousands of copies had been sold. In further justification of their conduct, they had the

audacity to state that every bookseller in Paternoster Row sold the book in question; which statement is as far from the truth as it could well be. Holywell Street, the place *par excellence* for obscene literature, would have been nearer the truth, as we do not believe such a work would be found in any booksellers in Paternoster Row, which is the great literary thoroughfare of the metropolis, and occupied by the most respectable firms, who are much too jealous of their honour and of the public trust imposed upon them to degrade their calling with such filth.

The case has created considerable interest amongst the profession in Yorkshire, and we much regret that we have not space to give a fuller *resumé* of the trial. But from the foregoing epitome, our readers will be able to gather the nature of the work thus brought to light, and the justification for it by a firm of *theological publishers*. Fortunately, the judge took them at his value, not their own, and discharged the case with some not very complimentary remarks to the publishers of "The Sham Works of Aristotle."

Treatment of Small-pox by Cold Baths.

It appears from a translation, contributed to the *Glasgow Med. Journal*, by Dr. Samson Gemmell, that M. le Dr. Clement, of Lyon, has successfully treated some bad cases of small-pox in the above manner. Curschmann in Ziemssen's recent "Cyclopædia" maintains that baths are only useful in the premonitory and eruptive stages. But considering that the greatest danger in small-pox is during the fever suppuration, Dr. Clement thinks that it is to this period of the disease that treatment should be directed. Before the employment of these baths, this physician had treated ten unvaccinated cases, eight of which had died. Of the seven cases treated by baths, details of which are given in the journal above mentioned, only two died, and these were both of a hæmorrhagic type. Those that recovered were very severe cases, while one of them was of the hæmorrhagic type, and another complicated with pneumonia. The most noticeable effects produced by baths on small-pox patients are, a fall in the temperature, often sudden and of some degrees; cessation of the delirium soon after the first bath; and a great reduction of the pulse-rate and of the respirations. Moreover, the eruption was in all the cases favourably modified. Dr. Clement states, that after the second bath he has generally seen the vesicles become larger and fuller, and during the eruptive stage, more opaline and of a better nature. The number of baths given in these cases varied from seven to eighteen.

The first baths should always be of a temperature from 25° to 28° C. The effect of the bath must be carefully gauged by the thermometer. The patients should be submerged beneath the water up to his shoulders; and when he is put to bed he should be enveloped in a sheet, and covered only with a simple woollen covering. Two or three baths may be given in the 24 hours.

Street Nuisances.

We understand that the Metropolitan Board of Works intend to apply for parliamentary powers to prohibit bill-posters from pursuing their trade in the public streets. We think that the most ardent cockney would scarcely like to commit himself to the opinion that the streets of London, even its leading thoroughfares, are distinguished either for architectural beauty or symmetry of design; when to their ugliness and sooty appearance are added the huge placards of enterprising tradesmen, and theatricals, posted upon innumerable hoardings; and almost every brick, in certain localities, is made to contribute its quota of income to the owner for the privilege accorded to bill-stickers; London is made hideous indeed. "They do these things better in France," is so perpetually sounded in one's ears, that its import has ceased to be noticed, and its repetition annoys rather than encourages to right action. The sentence is, however, in the present case significantly appropriate, as in Paris, which is probably the most beautiful city in the world, placarding in the streets is absolutely prohibited. Why should it not be in London? London can never be turned into Paris it is true, on account of its climate and its smoke, but London has been wonderfully improved of late by the pulling down of rookeries and other nuisances, the widening of streets, and the planting of trees in open places. In this fresh scheme of improvement, the Metropolitan Board of Works has our every sympathy, and if at the same time they will include that other and greater nuisance in their programme, the distribution of hand bills and filthy pamphlets by quack doctors, they will have earned a debt of public gratitude, and set an example which will not be lost upon other large towns.

Abscess of the Liver.

In the *Practitioner* for the current month, there is a good practical paper on this subject, by Sir J. Fayrer, K.C.S.I., M.D., in which the author draws attention to the insidious manner in which these abscessss are often developed. As a rule, the early symptoms of suppuration are those of congestion, with bulging of the side, either between or below the ribs, with chills or well marked rigors, high temperature and sweating; but sometimes none of these symptoms are well pronounced, and yet an abscess may have formed and escape detection until the bulging and fluctuation, or until the sudden evacuation of its contents through the bowels, the lung, or stomach, or into the peritonæum reveals the true state of matters. Several cases are quoted in illustration of the insidious invasion of this affection, while attention is also drawn to the fact, not so generally understood, that a man may have an abscess of the liver, which is not evacuated, and yet recover after its removal by absorption, or by its remaining in a state of quiescence for the remainder of his life.

With regard to the vexed question of the priority of hepatic abscess, or of dysentery, in those cases where these affections occur together, Sir J. Fayrer, is inclined to regard them as independent of each other, though often co-existent, and due to the same climatic causes.

As to the treatment of liver abscess, the author advises at the outset local depletion by leeches on the side, when the symptoms are acute, the pain great, and the fever high. Also free purgation by mercurials, salines, and ipecacuanha, with hot fomentations, rest, and a light diet. When it is obvious that pus is formed, the evacuation of the matter must be favoured by such channels as may

seem most favourable. The strength must be supported, and irritation allayed; and when the abscess is sufficiently near the surface to justify exploration or puncture, it should be evacuated.

British Pharmaceutical Conference.

THE following are the titles of papers already announced to the Secretaries for reading at the approaching meeting at Plymouth on Tuesday and Wednesday, the 14th and 15th of August:—

1. The Supply of Cinchona Bark as connected with the Price of Quinine. John Eliot Howard, F.R.S. 2. Report of the Committee on the Extraction and Investigation of the Aconitines of *Aconitum Napellus*. Dr. Wright, F.C.S., J. Williams, F.C.S., and T. B. Groves. F.C.S. 3. Report on the Active Principle of Capsicum Fruit. J. C. Thresh, F.C.S. 4. The Fats in Capsicum Fruit. J. C. Thresh, F.C.S. 5. Report of Continued Researches on Essential Oils. Dr. Tilden, F.C.S. 6. On a Product of the Oxidation of Barbaloin and Socaloin. Dr. Tilden, F.C.S. 7. Report on the Proximate Constituents of Ivy Berries. R. H. Davies, F.C.S. 8. Report of a Research (part 2) on Essential Oil of Sage. M. M. P. Muir, F.C.S., and Mr. Siguira. 9. An Impurity in Oxide of Zinc. W. W. Stoddart, F.C.S. 10. An Improved Preparation of Ergot. Mr. A. W. Postans. 11. The Microscope in Pharmacy. Mr. J. Cooke. 12. Additional Notes on the Assay of Opium. 13. Tincture of Acetate of Iron. Dr. C. R. C. Tichborne, F.C.S. 14. Sugar in Pharmacy. Dr. C. Symes. 15. A Point in Pharmaceutical Ethics. Mr. S. R. Atkins. 16. A Paper on Brucia will probably be read by W. A. Shenstone, F.C.S..

The Secretaries state that eight or ten other papers are expected.

Proposed Dental Diplomas in Ireland.

ON Saturday afternoon a meeting of dentists representing the five northern counties of England, was held in the Queen's Hotel, Leeds, for the purpose of assisting the dentists in Ireland to obtain a diploma from the Royal College of Surgeons of Ireland. Mr. J. S. Turner M.R.C.S., of London, was called upon to preside. A report was presented from a committee appointed at Manchester, and the following resolutions were adopted:—"1. That we hail with satisfaction the efforts that are being made by the dentists in Ireland to induce the council of the Royal College of Surgeons in Ireland to institute a dental diploma, and we pledge ourselves to give them our cordial support. 2. That this meeting has heard with satisfaction the statement of the committee appointed at the meeting of dentists, held in Manchester, on May 12th, and pledges itself to support the committee in the course which it has adopted."

The Sanitary Institute of Great Britain.

WE understand that an invitation has been sent from Scarborough, and accepted by this newly-formed Association, to hold the first provincial session in that town. The date is fixed for August 21, and three following days. Dr. Richardson, F.R.S., has consented to deliver an address, and Mr. R. Brudenell Carter, F.R.C.S., will deliver an evening lecture. Papers on "Sanitary Science" will be read by Surgeon-Major F. D. Chaumont, of Netley; Mr. H. C. Bartlett, F.C.S., Mr. Wm. Eassie, C.E., Mr. John Towel, J.P., Oxford; Mr. Ernest Turner, F.R.I.B.A., and most probably one by Dr. Corfield, of London.

Mr. Hawksley, C.E., is also expected to contribute a paper on Sanitary Engineering. Altogether the meeting promises to be a great success.

An Error in the Pharmacopœia.

WE believe the last issue of *The British Pharmacopœia* has been as carefully edited, and that it is as free of errors as a book can well be. A rather important mistake, however, occurs at page 180, and as it embraces the difference between ounces and drachms, we draw attention to it in order that our readers may alter it in their own copies of the work. Liquor arsenicalis is printed thus:—"Take of

Arsenious acid, in powder Carbonate of potash . .	of each 80 grains
Compound tincture of lavender .	5 fluid drachms
Distilled water	a sufficiency."

The 5 fluid drachms of comp. tinc. lav. should read 5 fluid ounces.

The Colorado Beetle.

THE report which has appeared in our contemporaries of the appearance of the dreaded Colorado beetle in the vicinity of the Docks, Dublin, has, we are happy to announce, no foundation in fact. The specimen from which the report originated was shown on examination by Mr. Kirby of the Royal Dublin Society, to be one of the sea wood-louse tribe, and not at all like the genuine Colorado beetle, which has coloured stripes running horizontally along its back. At the same time our friends the Germans were terrified by similar reports that this insect had effected a lodgment at Vlotho; this also turns out to be untrue, and an official denial has been issued in the *Berlin Gazette*.

AT the last meeting of the Limerick Board of Guardians, the clerk read a letter from the Local Government Board in reference to the recent investigation held by Mr. Bourke into the case of John Madigan, and charges against the medical officers preferred by Dr. O'Sullivan. It appears to the board on the whole, that there is no ground for censure on the conduct of the two medical men concerned, and the proceedings connected with John Madigan's admission and attendance on the first night, appear to have been unobjectionable. This decision communicates to our readers the upshot of a most discreditable persecution of the resident medical officers of the Limerick Workhouse, by one of their own profession, Dr. O'Sullivan, who is also a guardian of the union. Month after month the board has been occupied with accusations and attacks made by this gentleman against the medical officers, all of which have proved on inquiry to be unwarranted. At length matters have come to such a condition that the guardians have unanimously refused to entertain any more complaints, or to print upon their notice paper any further motions of Dr. O'Sullivan on the subject, and he is unsupported even by the sypmathy of any one of his brother guardians. We hope that this verdict of the Local Government Board will be the last

that we shall hear of these onslaughts on the medical officers of the workhouse. We have been unable to discover any reason or propriety in Dr. O'Sullivan's proceedings, and a persecution such as he has carried on is discreditable and unprofessional, unless dictated by a regard for principle, and on a good foundation.

THE will of the late Professor Wilson, of Dublin, devises eighty shares in the Civil Service Building Society of Ireland to St Mark's Ophthalmic Hospital, after the decease of the survivor of the two persons to whom the dividends thereon are payable for life. He also devised a reversion in one undivided moiety of the lands of Illaunroe, county of Galway, to the same institution, £50 each to the Masonic Male and Female Orphan Schools in Dublin, and £50 to the Molyneux Asylum for the Blind, Leeson Park, Dublin. And the residue of his personal property after payment of his debts, legacies, and bequests, testator directed to be placed to the credit of St. Mark's Ophthalmic Hospital aforesaid, either as a building or permanent endowment fund as the governors shall think best.

SMALL-POX caused but 23 deaths in London, against 43 the week previous. This is the smallest number since the commencement of the epidemic in November last. Of this number eight only died in private dwellings, three of whom were children in the same house, *all unvaccinated.* Perhaps our anti-vaccination friends will kindly swallow this pill!

Correspondence.

PRIVATE LUNATIC ASYLUMS AND PRIVATE PATIENTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Answering an anonymous correspondent I regard in the same light as I do fighting in the dark, I regret, therefore, that "Humanitarian" has not come forward in his true light, and so enabled me to see whether his statements are entitled to the weight to which he would no doubt lay claim. I make it a practice never to write anything to which I do not affix my name. The letter of "Humanitarian" is an excellent one, and I regret the more that I am in ignorance of my antagonist. I am asked, in the first place, why Dr. Lockhart Robertson should recommend to the Select Committee the appointment of a visiting physician to be attached to private asylums. I will answer this statement, provided "Humanitarian" will answer me the following questions, which are also connected with Dr. L. Robertson's evidence before the Lunacy Committee: Why did Dr. Robertson, in reply to a question from the chairman whether he knew of any cases which had been improperly detained in private asylums, select one asylum to vent his feelings against, and in the following way: He informed the Committee that there were three patients improperly detained in this asylum; the first case was that of a physician detained "long after recovery," the real facts, however, transpiring from the second evidence given by him, that this patient was *really* detained as a lunatic for three years after leaving the asylum, deprived of his property, and under the actual supervision of Dr. Robertson. The second case was that of a gentleman who, Dr. Robertson stated, but without proof, was detained on a false report of using threatening language against his wife. This patient was proved by other witnesses a dangerous lunatic, and was even detained as *non compos mentis* for eleven months after leaving the asylum. The other case was that of a captain in the army alleged to have been detained twenty years longer than he ought to have been, but it appears that he is at the present moment under two lunacy certificates, and under Dr. Robertson's visitation. In this case it may be well to mention that the patient was never seen by Dr. Robertson until he had been in the asylum for twenty years, and he has made this statement upon mere assumption, appearing, therefore, to entirely ignore the opinion of his colleagues and the Commissioners in Lunacy who had seen the case six times a year for the twenty years referred to. Each of these persons, although discharged from the asylum at Dr. Robertson's request, remained lunatics for a long period after. Yet, he made the extraordinary statement to the Committee that there were three patients improperly detained at this asylum—*mirabile dictu.* On a future occasion I shall revert to this visitor's evidence *in extenso,* but I mention these facts to show that your readers must not attach too great weight to the opinion of Dr. Robertson on private asylums, especially as he confessed to the committee that he had written against private asylums before he had even visited them.

I maintain, most emphatically, that the six visits of the Commissioners afford a sufficient safeguard against improper detention. I say this after a lengthy and practical experience of the visitation of licensed houses by the Commissioners in Lunacy. It might be interesting to know whether "Humanitarian" has ever accompanied the Commissioners on their visits. Is he aware that, as a rule, they spend from four to five hours even at one of our smallest asylums, that they see every case and examine them minutely, granting lengthy private interviews to all who require such? There are no body of officials who so thoroughly perform their duties as the Commissioners in Lunacy. I am perfectly aware that some persons are adverse to private asylums, and express their opinions freely in the medical papers; but the generality of these are lamentably ignorant on the subject of which they are writing. I deny the statement alluded to by "Humanitarian" that a third of the inmates of private asylums are not insane, also the preposterous assertion which, however, appears to be on the minds of some of the Committee, that drugs are administered wilfully or carelessly to the permanent detriment of patients. This absurd nonsense must have been gathered from a lunatic's note-book, or from his insane imagination; I cannot conceive how such an idea could have originated in a sane person.

I am asked what protection is afforded by the Commissioners? Two duly attested certificates. The medical profession is acknowledged to be an honourable one, the Commissioners, no doubt, agree in this, and, consequently, they are not disposed to doubt the testimony of qualified persons. Moreover, the medical officer of the asylum must send to the Commissioners his opinion of the case within seven days of the admission, and some person must have signed the order for the patient's admission. Thus we see a gigantic conspiracy must take place to illegally incarcerate a patient in an asylum; and to properly detain him there this conspiracy must be increased by the addition of the Commissioners in Lunacy to the number. Does "Humanitarian," when he receives a letter, generally doubt the truth of its contents? I maintain that there are many persons at large who ought to be confined in asylums, but that under our existing lunacy laws no one can either be illegally admitted or detained in a private licensed house.

Your obedient servant,

London, July 14, 1877. L. S. FORBES WINSLOW.

THE NON-ALCOHOLIC TREATMENT OF DISEASE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In a letter from Dr. Edward Haughton in the MEDICAL PRESS AND CIRCULAR relative to the non-alcoholic treatment of disease, he remarks, "It is now many years since I witnessed the failure of the great Mr. Cusack to preserve life in a case of aneurism for which he tied one of the common carotid arteries, death having taken place at the end of a few days from hæmorrhage. But I find that my friend, Dr. Edmunds, has been successful in a similar case, and I have seen a case of typhoid fever, which is now in hospital, and is doing well on the non-alcoholic system." I would ask Dr. Haughton what is the connection between Mr. Cusack's failure and alcohol? Does Dr. Haughton think alcohol is usually employed in the treatment of aneurism? I believe not. Does Dr. Haughton not show that numbers of cases of

typhoid fever are, and always have been, treated without alcohol? I put these questions knowing that a great deal of capital is being made by fanatical teetotallers out of the *non-alcoholic treatment*, and I know well that Mr. Cusack's failure will be attributed by them to the use of alcohol, and that Dr. Edmunds will be acknowledged as a physician who *can* treat fever successfully without alcohol. I should say that there are a great many more cases of enteric fever treated without the use of alcohol than with it by the hospital physicians of the United Kingdom.

Yours obediently,

T. W. GRIMSHAW, M.A., M.D.,
Physician to Steeven's and Cork Street
July 12th, 1877. Hospitals, Dublin.

MIDWIFERY PORCEPS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In a letter headed as above, which appeared in your columns of the 20th ult., Dr. Christie claims the credit of having fulfilled all the advantages of Tarnier's forceps by some modification he *suggests* of Knight's forceps.

By giving any ordinary forceps the proper curves he may no doubt do away with the injurious pressure caused by the handles on the posterior edge of the fourchette, perhaps nearly as perfectly as is done by Tarnier with his new forceps; that is not, however, the essential difference between these forceps and those in general use. Tarnier lays great stress on the advantage of a guide for the operator to show in what direction at each moment traction should be made.

The traction-rods in his forceps are jointed to the prehensile handles at the fixed centre-point of contact with the child's head by a universal joint, so drawn as these does not in any degree alter the direction of the handles of prehension, which are then permitted to act freely as an accurate guide of the direction which the traction-rods should follow as the head advances. A cross-bar attached to the blunt hooks at the extreme ends of the handles of Knight's forceps, no matter how freely it may be jointed, can in no way accomplish the result obtained by Tarnier's rods; the handles cannot guide the operator, being always under his own control and easily made to point in a wrong direction each moment by any traction he makes not exactly in the axis of the pelvis.

Yours, &c.,

WM. HUME HART, M.B., M.Ch.,
July 2, 1877. Rotunda Hospital.

THE FRUITS OF PHILOSOPHY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In an age which may very properly be called *nihilistic*—that is, when almost everybody believes nothing—you deserve some praise for possessing the boldness to adhere to "worn-out" principles, and for publishing your views upon the new "philosophy" as a THEIST and a CHRISTIAN.

Liberty is a fine-sounding word, and freethought, free-speech, free-writing are all very good things in their way; but if they are to "land" us into "free love" (for that is really the flower and the "fruit" of this new "philosophy") there are still some few people in Britain who would pray earnestly for the *freedom* to live under a despotism, and who would prefer the "civilisation" of Brigham Young, or of the Grand Turk himself, to that of this new gospel.

If it be true after all, as some old-fashioned and foolish people believe it is, that "God created man in his own image . . . male and female created He them. And God blessed them, saying, 'Increase and multiply, and fill the earth,'" there is nothing, in my humble opinion, so subversive of all law, Divine and human, as the teaching of this modern "philosophy." But with the "philosophers" who deny this (*i.e.*, the old revelation) I will not press the argument, but am content to take much lower ground; and for this purpose shall only refer them to the example to be gathered from the study of the "lower orders" of animated nature in the abstract—to "our ancestors," the Chimpanzee, or the great gorilla himself if they so choose.

After "self-preservation, the first law of nature," the *instinct* of the whole "irrational creation" is *the propagation of their species*. Man alone, the only reasoning animal, created at the beginning only "a little lower than the angels," is the poor creature who is not content to destroy his kind after the orthodox fashion of murder—call it war, if you like—but, to gratify his lusts, he must needs invent a new process or performance which aims at the entire "suppression" of the race!

Human nature at best is bad enough, and needs but few promptings to become worse; but once take away from sexual commerce its natural consequence, reproduction, and then farewell law, morality, and religion. The young girl unmarried or the young wife temporarily separated from her husband who now are restrained from vice not by love of virtue solely, but by fear and shame for the consequences of an "imprudence" (how delicate in expression have we become!) would, under the new system, know or fear no restraint whatever; and thus *charity of any kind*, while still met with, perhaps, in books, would be a word unknown, "unhonoured, and unsung" throughout the world! Marriage, civil or canonical, would become in a little time a thing equally unknown, and in its place we should have a promiscuous herding together of the sexes, in which state no man would be certain of who his mother, sister, or wife might be, *to leave out of the account altogether his male relations, including, as formerly, his father!* "Society" might be benefited by this return to the primitive state of "our ancestors," but I, for one, have my doubts upon it.

Our neighbours, the French, whom Dr. Drysdale and others of the Malthus-Bradlaugh School, are so fond of quoting on this weary question, appear to have realised very unpleasantly for themselves the "fruits of *conjugal prudence*," for, if I mistake not, a Commission of Inquiry sat in France not many years ago to devise a remedy for an alarming and continued decrease of the population (*i.e.*, a relative, not absolute, decrease); and, if my memory is not astray, it strikes me that I read, a few months back, in your Journal, that in 1870 or '71 the deaths in France exceeded the births by something more than four hundred thousand! As a military nation, France has found these consequences of "*conjugal prudence*" to be so *imprudent* that very lately she has improved her laws for the protection of infant life as a commencement, and other reforms are hoped for.

So long as the gold of England could purchase the hireling warriors of the Continent to fight her battles, she did not feel the destruction of "a bold peasantry" to be either a loss or an *imprudence*. But as times have changed now, and when battles are fought between half-a-million of combatants, every nation in Europe—England included—will want her own "bold peasantry" to take the field, as soldiers—*if required*. In view of all this they are poor political economists who would counsel check of any kind—*positive or preventive*—to the normal increase of population of this *rich* Empire.

I apologise for troubling you at such length, and

I am, Sir, yours faithfully,

J. O'FLANAGAN, L.R.C.P.Edin.

Houghton-le-Spring, Durham,
7th July, 1877.

Literature.

DISEASES OF THE LIVER. (*a*)

DR. MURCHISON'S name has been for some time before the profession, as an authority on the affections of the liver. He has had unusual opportunities of studying these important maladies, having been at one time on the staff of the Bengal army. The first edition of this work was published in 1868, and was regarded with much favour at the time. This edition is really a new work, for what there is of the first edition is re-written, and much which is perfectly new is added to what may be termed the old portion of the work; whilst the addition of the substance of the author's Croonian lectures constitutes it a new work entirely. In the preface the

(*a*) "Diseases of the Liver," including the Croonian Lectures delivered before the Royal College of Physicians of London in 1874. By Charles Murchison, M.D., F.R.S., Physician to, and Lecturer on Practice of Physic, St. Thomas's Hospital. Longmar, Green, and Co. 1877. Pp. 634.

author disclaims for his work any pretensions to being a systematic treatise on the diseases of the liver. Nevertheless, the reader will find in this volume most of what he wishes to know, in an excellent and succinct form.

The relations of the liver, its position, form, and the modifications wrought by disease, engage the introductory chapters. After giving the normal position, he says "But it must not be forgotten that, even in the same individual, the liver is constantly liable to slight alterations in its position consistently with health."

As to the spurious enlargements of the liver: "Apparent enlargements from tight-lacing are far more common than is generally believed. You cannot pay many visits to the *post-mortem* room without observing examples of this malformation, which accounts for not a few movable tumours in the abdomen, that are a source of anxiety both to the patient and the medical student."

The genuine enlargements of the liver are divided into two sections—the "painless" and the "painful;" a division which he prefers to Dr. Bright's arrangement of them into "smooth" and "irregular." Of the painless enlargements, the waxy, lardaceous, or amyloid liver comes first. It sometimes attains so large a size as to fill the abdominal cavity almost itself. Some good cases illustrate this form of disease.

Next comes the fatty liver, where the enlargement is due to the accumulation of oil. There is never any ascites or enlargement of the superficial veins of the abdomen in this form of disease. It is often co-existent with a fatty heart, and such sufferers not uncommonly die of rupture of the structurally-weakened heart. Simple hypertrophy of the liver has been seen.

Then comes hydatid tumour. Unlike the enlargements so far considered, it is not uniform in every direction, but usually follows one direction in particular. The surface is smooth, and free from irregularities of every sort. Jaundice is an exceptional occurrence; its diagnosis from other abdominal tumours is carefully given.

Then follow the painful enlargements, and first congestion. This is to be distinguished from passing conditions of temporary fulness. The temporary increase of blood in the liver after a meal may become morbid in degree and permanent, if the ingesta be habitually of an irritating character. As to the treatment, bland articles of diet alone are admissible. "In modern practice much mischief is often done by compelling patients with heart disease and congestion of the liver to swallow large quantities of brandy." Purgatives are to be freely used.

Then comes the consideration of interstitial hepatitis, or cirrhosis, after which stands inflammation of the bile-ducts, often found along with cirrhosis, This catarrh is most common in elderly persons of the gouty diathesis, and when so associated is often persistent enough to raise the suspicion of cancer. Obstruction of the common bile-duct by calculi, tumours, &c., leads to enlargement of the liver in two ways—1, By causing dilatation of the biliary passages, and 2, By inducing inflammation of them, with increase of connective tissue in the liver.

Lecture V. is devoted to suppurative inflammation of the liver, as pyæmic abscesses, of which some illustrative cases are given. Tropical abscess is then discussed very thoroughly. The question of operative procedures is gone into at length, and the pros and cons given in detail.

The next chapter is devoted to cancer of the liver. Here the enlargement is usually irregular, and simulates a multilocular hydatid tumour. Then follow spindle-cell sarcoma, myxoma, tubercle, &c., and enlargements of the gall-bladder, which finish the diseases of the liver accompanied by enlargement of its bulk.

The contractions of the liver are next considered, the chapter commencing with the spurious contractions—*i.e.*, with apparent diminution of the size of the organ. Simple atrophy is caused by diminution of the size of the different lobules. It occurs with old age and inanition. Acute, or yellow, atrophy of the liver is a rare but very remarkable disease. It has been otherwise termed "malignant," "typhoid," or "hæmorrhagic jaundice." It is not attended by pyrexia. Chronic atrophy of the liver may be found as a primary cirrhosis, as gin-drinker's liver, or as hyperæmia, from obstruction to the circulation, from disease of the heart or lungs. It is commonly accompanied by ascites and enlargement of the spleen. Hæmorrhoids, hæmorrhage from the mucous surfaces of the stomach and bowels, and, in less severe conditions, catarrh of these organs are common. Pain and jaundice are not common.

Then comes jaundice, spurious and genuine. The means of distinguishing spurious jaundice are carefully given. When arising from obstruction to common bile-duct, the liver itself is the organ most deeply stained. The symptoms connected with jaundice are clearly given. The causes of jaundice are gone into at great length, and this section of the work will repay careful perusal but is scarcely adapted either for quotation or condensation.

Lecture XII. is devoted to the consideration of the causes of the accumulation of fluids in the peritonæum. At first sight it does not seem likely that a distended bladder could be mistaken for ascites, but even John Hunter once made this mistake, and tapped the bladder. Such mistakes are all the more likely to occur from the fact that the patient often passes a fair amount of normal urine. A number of cases, illustrating the different forms of fluid accumulation in the peritonæal cavity, are given in detail.

Pain in the liver, its causes, and the maladies for which it may be mistaken, are then gone into. Gall-stones, their consequences and symptoms, follow. With this the old, or first portion of the work is finished, and the portion known as the Croomian Lectures follows. This portion is even more interesting than that already surveyed. Of the function of the liver in health, Dr. Murchison writes: "The liver has the power of making, and storing up for a time within its cells, glycogen ($C^6 H^{10} O^5$), a substance resembling dextrine ($C^6 H^{10} O^5$) in its chemical composition and reactions, and, like it, convertible into sugar by the action of albuminoid ferments. This substance always exists in the liver in larger amount during digestion than during fasting, attaining its maximum usually about four or five hours after a meal. It does not yet seem certain what the materials are from which it is mainly formed, but there can be no doubt that its amount is increased by the use of starchy or saccharine food. The circumstance, however, of glycogen being formed in considerable quantity in the livers of animals who have been fed for a month or more on flesh alone, and the fact that its quantity in the liver of a dog is always increased after a meal of flesh, show that it can also be produced from albuminous matter. The albumen of the food is converted by the gastric juice into peptone, which is also absorbed by the intestinal veins and carried to the liver, where it is believed to be decomposed into glycogen and nitrogenous products, such as leucin and tyrosin, which are ultimately resolved into urea. The glycogen derived from these two sources does not long remain in the liver, for the large quantity formed after a meal is quickly diminished on fasting. It is not got rid of by the bile ducts, for bile contains neither glycogen nor sugar. But either as glycogen, or more probably as sugar, into which it is believed by Bernard and most other physiologists to be reconverted by the action of an albuminoid ferment in the liver or in the blood, or transformed in some other way, it enters the blood by the hepatic veins." This glycogen is not only the source of our body heat, but "there are good grounds for believing that it assists in cell-growth; for, just as in plants the presence of sugar seems to be necessary for the most rapid development of cells, so in animals, glycogen can be found wherever cell-growth is actively going on." This glycogen is also capable of being converted into fat in the body, and so of constituting a more permanent form of storage for the wants of the system when the daily supply of food is insufficient. The liver, too, is the organ by which albuminoid matters

derived from the blood, the textures, or the food are broken up and converted into urea and uric acid, and subsequently eliminated by the kidneys. This latter function is the one which supplies the connection, so well known clinically, betwixt a bilious attack, so-called, and the presence of lithates in excess in the urine; they are imperfectly oxidised matters from hepatic inefficiency. When the liver is largely destroyed by cancer, the amount of urea is remarkably diminished. In acute atrophy of the liver, urea may disappear from the urine, and leucin and tyrosine take its place.

The third function of the liver is the secretion of bile. The bile-acids in human bile are two—glycocholic acid (C^{26} H^{43} NO^6), and tauro-chloric acid (C^{26} H^{45} NO^7 S). Both acids are derivates of albumen, and contain nitrogen; and tauro-cholic acid, to which the bitter taste of bile is due, contains all the sulphur of the bile. The amount of bile excreted daily in a person of average weight is about forty ounces, a large portion of which is absorbed. Bile assists in the assimilation of the different forms of food, fat, albumen, and glycogen, the excrementitious portion exciting movement in the bowels and preventing decomposition.

In consequence of its functions, then, various maladies are produced by disturbance of the liver. Diabetes, or glycosuria is the result of disturbances in the glycogenic processes, and may be serious, or of little moment, according to circumstances. There are many uncomfortable conditions connected with the bile-secreting processes, when disturbed, of which a good account will be found in these pages. But the most important disturbances of health are found associated with the second function of the liver, viz., the disintegration of waste albuminoid matters. These are mainly the result of indulgence in food in excess of the wants of the body, and imperfect oxidisation from insufficient exercise being taken. If more food be taken than is required, and it be not stored up as fat, then the work of the liver must be increased, and disturbance of it with lithates in the water are the consequences. The biliary disturbances and thick urine which follow a good dinner, or repletion, are the results of the assimilation of food far in excess of the needs of the body. The respired oxygen is neutralised by the readily oxidisable matters in the system, and the albuminoid matters are left unoxidised, or but partially oxidised, and consequently there is an excess of bile acids and of lithates in the water. It may be quite true that saccharine or oleaginous food will most readily excite such biliary disturbance, but it is evident that none of these waste products can be produced if albuminoids be not taken. Dr. Murchison fails to see this as clearly as he ought, or perhaps fails to put it clearly, in speaking of diet in the treatment of functional disturbance of the liver. As a fact, a non-nitrogenous diet, with alkaline purgatives, especially in the morning, persisted in steadily, will give great relief to persons suffering from chronic and persistent biliousness, contrary to what is ordinarily held. Rest, functional rest of an organ, is a great matter when it is disordered, and the greatest relief which can be furnished to a disordered liver is to reduce to a minimum the amount of albuminoid material it has to break up: a fact we recommend to Dr. Murchison for his consideration. The maladies which arise from lithæmia, the different symptoms thereof, the method by which they are to be relieved, and the remarks on treatment, are excellent, and well worthy of perusal. Dr. Murchison's thoughtful work will be an acceptable addition to the library of every earnest practitioner.

TRAITE DES MALADIES DE LA PROSTATE.(a)

PERHAPS there is no class of diseases more entitled to special study and consideration than diseases of the urinary organs. Certain social and moral considerations become entangled in their train so frequently, and to such an extent do these involve the psychical, as well as the physical constitution, that the specialty of urinary diseases may well be regarded as one of the most justifiable. This seems to be admitted on the continent and in America, while with us urinary affections are relegated to the background to an extent not compatible with their importance. To the French literature of this department of study we are particularly indebted. The works of Rayer and Civiale have been long regarded, and will no doubt long continue to be recognised, as standard and exhaustive works on the subjects of which they treat, and abreast of scientific restarch as then existing. We are indebted besides to French literature, since the publication of these standard works, to numerous other excellent works on the subject in this department of study. The work before us is limited to the diseases of the prostate gland. It forms the substance of a course of lectures delivered at the Ecole Pratique. It is divided into twelve chapters. In the first the surgical anatomy of the gland is considered, and the works of Senne, Sappy, Dolbeau, and Richet are examined. In considering the structure of the gland the researches of Ch. Robin are specially referred to. In the second chapter the author deals with "General Considerations," under which head are examined the influences of diseases of the prostate on the bladder, the kidneys, and the heart, congenital malformations, wounds, and contusions of the organ.

Chapter V. is devoted to inflammation of the prostate; and the author coincides with M. Robin that true prostatorrhœa had no existence; that is to say, that the discharge in cases of prostatitis, is not composed simply of the prostatic fluid, but is a compound of this secretion, and that from the glands of Littre, Mery, and of true seminal fluid. The question of spermatorrhœa is then considered in a scientific manner, and its treatment rationally indicated. The treatment of chronic prostatitis is exhaustively discussed.

Chapter VI. is devoted to ulcerations of the prostate; its various causes are duly indicated and examined. Cancer of the prostate is discussed in the succeeding chapter; and tubercle and its complications form the subject of the next. Prostatic calculi are discussed in Chapter IX., and their surgical treatment passed in review. Chapter X. comprises an epitome of the various forms of cysts. Chapter XI. the deviations from the normal size, and Chapter XII., the last, the various forms and causes of atrophy.

Such is an outline of the contents of this volume. An exhaustive knowledge of the literature of his subject is manifested by the author. The book is numerously illustrated, clearly written, and altogether forms an excellent epitome of the subject of diseases of the prostate, and as such will, no doubt, prove highly acceptable to many engaged in this department of study.

THE PUBLIC HEALTH (IRELAND) BILL

Has at length, after many postponements, received its second reading unopposed on Thursday last, and was referred to a Select Committee. The members have not yet been named, and it is not known whether it will receive verbal evidence. It is to be hoped that it will, because, otherwise, the questions which arise may be dealt with without due consideration of the views of the sanitary officers. The Irish Medical Asssociation is, however, on the alert, and has already written to the Chief Secretary to tender its co-operation and counsel in the reconstruction of the Irish sanitary system, and we hope next week to be able to state what is likely to be done in reference to the subject.

Medico-Parliamentary Intelligence.

HOUSE OF COMMONS, MONDAY, JULY 16th.

SMALL-POX IN THE METROPOLIS.

Mr. SCLATER-BOOTH, in reply to Dr. Lush, said, according to the latest information, there were in the Metropolitan Asylums Hospitals at the present time 621 patients, against 850 and 950 in the hospitals in May and June last. There were also, at this moment 483 vacant beds, so that it might be said that the epidemic was fast abating. There was greater accommodation, greater attention paid to the patients, and better means of holding the present epidemic in check than had been the case in former years.

THE LOCAL MEDICAL DEPARTMENT IN INDIA.

Lord G. HAMILTON, in answer to Dr. Lush, said that for some time past the whole question of the Local Medical Department in India had been under the consideration of the Indian Government, but they had not yet come to any definite conclusion thereon, and therefore he was not in a position to state whether or not the administration of the army medical service in India was to be in future in the hands of the Indian government only, or what alterations, if any, would be made.

Medical News.

South London School of Pharmacy, Kennington Cross, S.E.—The distribution of prizes at this school for the past session took place on Saturday last. Prize list:—*Majors Senior Chemistry Certificates:* Messrs Longman and Mortlock (equal). *Do. (special)* for practical chemistry, Mr. Simpson. *Minors (Junior Chemistry)* Medal, Mr. Lister. Certificates, Middleton and Roberts (equal). *(Botany)* Medal, Mr. Perry; Certificate, Singleton. *(Materia Medica)* Medal, Wilkerson, Certificate, Perry. *(Pharmacy and Practical Dispensiny)* Medal, Middleton, Certificate, Balcombe. *Extra Certificates of Merit*—Messrs. Cobb (Pharmacy), Cliff (Chemistry and Materia Medica), Lister (Chemistry and Materia Medica), Morgan Smith (Chemistry and Materia Medica), Oldershaw (Pharmacy), Shone (Chemistry and Materia Medica).

St. Thomas's Hospital.—On Monday, July 16th, the prizes to the students of the College attached to this Hospital were distributed by the Lord Bishop of London. The following is a list of the principal prizes:—*Summer Session*, 1876.—First Year's Students—H. A. H. Fenton, College prize £15, Takaki Kanehiro, College prize £10, T. D. Savill, College prize £5. Second Year's Students—W. F. Haslam, College prize £15, R. P. Smith, College prize £10. *Winter Session*, 1876-77. Entrance Science Scholarships—R. J. Williamson, Scholarship £60, H. N. Holberton, Scholarship £40. First Year's Students—W. A. Duncan, the Wm. Tite Scholarship £30, H. N. Holberton, College prize £20, W. W. Webber, College prize £10, A. B. Carpenter, Certificate of Honour. Second Year's Students—A. Newsholme, College scholarship 40 guineas, Takaki Kanehiro, College prize £20, C. A. Ballance, College prize £10. Third Year's Students—S. J. Taylor, Musgrove scholarship 40 guineas, S. J. Taylor, College prize £20, S. A. Crick, College prize £15. Prosectors—T. L. Laxton, prize, G. S. Hatton, prize. Solly Medal and Prizes—W. H. Battle, medal and prize £15. C. W. de Lacy Evans, medal and prize £5. Surgery and Surgical Anatomy—H. U. Smith, the Cheselden medal. Practical Medicine—G. B. Longstaff, the Mead medal. For General Proficiency and Good Conduct—C. E. Sheppard, the Treasurer's gold medal. In addition to the above, a certificate of honour was awarded to each of the prize takers, and to the house surgeons, house physicians, &c.

NOTICES TO CORRESPONDENTS.

SCARCE NUMBERS.—Double price will be given for the following numbers of this Journal if sent to the London office:—October 6, December 22, 29, 1869

CROWDED OUT.—We are told of an editor at a dinner-party who, on being asked if he would take some ice-pudding, replied in a fit of abstraction, "Owing to a press of more important matter we are unable to find room for it." We must ask our correspondents to accept a similar excuse from us for the delay in the insertion of original communications, letters, &c., during the past few weeks. As the societies are not now sitting we shall have more space for other matter, and shall be glad to find room for any interesting clinical cases hospital, or private, practice our readers may send us.

AQUERY.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Would one of your staff be kind enough to tell me in your "Answers to Correspondents'" column, where I could find an account of a place in Italy, or Island of Mediterranean (I fancy), where, when it was drained and cleared of ague, that phthisis followed, and where the people petitioned the authorities to restore the ague and marshes.

I have read this in authentic works, but, for my life, I can't remember where. I should be very much obliged if you can put me on the track of this fact. I am, Sir, yours truly,

WILLIAM H. PEARSE.

DR. W. T. G.—Your interpretation is perfectly correct, and the "prudential" methods of the Malthus school are sufficiently contemptible without our publishing your "plain English" of them, which would offend many eyes and would edify none.

DR. S.—Next week if possible.

DR. O'FLANAGAN, Durham.—We shall be glad to receive the case mentioned in your note for our "Clinical Records."

ARMY OR NAVY?

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Would you kindly inform undersigned in your next "Notices to Correspondents" which of the two services—Army Medical Department or Naval ditto—is *at present the easier to get into*; also which is the more particular regarding the physical examination?

Yours truly,

"DISPENSARY MEDICAL OFFICER."

[Try the Navy, the authorities are at present in want of candidates, and are not so particular as to the physical examination.—ED. M. P. & C.]

VACANCIES.

Royal Hospital for Diseases of the Chest, City Road, E.C.—Two Assistant Physicians. Honorary. (See Advt.)

Central London Throat Hospital, Gray's Inn Road.—Two Clinical Assistants. Honorary. Applications to the Secretary.

Wolverhampton General Hospital.—Physician's Assistant and Pathologist. Salary, £50, with board and lodging. Applications to the Chairman of the Medical Committee.

Charing Cross Hospital.—Assistant Physician. Honorary. Applications, under cover, to the Secretary.

Bristol General Hospital.—Assistant House Surgeon. Salary, £50, with board and lodging. Applications to the Secretary.

Cavan Union. Ballananagh Dispensary.—Medical Officer. Salary, £100 per annum. Election, 21st inst.

Celbridge Union Workhouse.—Medical Officer. Salary, £100 per annum, Election, 25th inst.

Lurgan Union, Tartaraghan Dispensary.—Medical Officer. Salary, £100 per annum. Election, 21st inst.

Wilts County Asylum.—Assistant Medical Officer. Salary, £110, with board and residence. Applications to the Clerk, at Devizes.

Township of Manchester.—Resident Assistant Medical Officer for the Workhouse at Crumpsall. Salary, £140. Apply to the Clerk of the Guardians, New Bridge Street, Manchester.

Farringdon Union.—Medical Officer for the Shrivenham District. Salary, £70, with fees extra, and £10 additional as Health Officer. Address the Clerk to Guardians, Farringdon, Berks.

APPOINTMENTS.

BARNES, R. S. F., M.B., C.M., M.R.C.P.L., a Physician to the British Lying-in Hospital.

CHARLES, D. A. M., Medical Officer, &c., for the Bellaghy Dispensary District of the Magherafelt Union, and Medical Attendant to the Royal Irish Constabulary, Bellaghy and Castledawson.

CLIPPINGDALE, S. D., M.B., Resident Accoucheur to the London Hospital.

DORAN, Alban H. G., F.R.C.S., Pathological Assistant to the Museum of the Royal College of Surgeons, vice J. F. Goodhart, M.D., resigned.

HAYES, P. J., L.R.C.P.Ed., L.R.C.S.Ed., a Medical Officer for the Cork Dispensary District of the Cork Union.

HENDERSON, A., M.D., Medical Officer for the Central District of the Parish of Brighton.

MAHOMED, F. A, M.D., Medical Registrar to Guy's Hospital.

MAYNE, N., L.K.Q.C.P.I., L.R.C.S.I., Surgeon to the County Longford Infirmary and to the County Gaol.

O'FLAHERTY, R. G., M.B., L.R.C.S.I., a Medical Officer, &c., for the Kingstown Dispensary District of the Rathdown Union, co. Dublin.

OXLEY, A. R., M.R.C.S.E., House Physician to the Radcliffe Infirmary, Oxford.

SMITH, W. H., M.R.C.S.E., L.S.A.L., House Surgeon to the Beckett Hospital and Dispensary, Barnsley.

Deaths.

HEBERDEN.—On July 8, at Park Street, Grosvenor Square, Thomas Heberden, M.D., aged 75.

MCCORMICK.—On July 13, George Mark McCormick, M.D., T.C., of 5 Usher's Island, Dublin, and Westbrook, co. Wicklow.

O'BRIEN.—On July 6, at Bray, Robert O'Brien, L.K.Q.C.P.I., formerly of Lower Leeson Street, Dublin, aged 71.

PRIGG.—On July 7, at Notting Hill, Frederick Prigg, M.R.C.S.E., aged 29.

SCARRY.—On April 29, at Calcutta, John William Scarry, L.R.C.S.I., Surgeon of the British India Company's mail steamer *Dorunda*.

SMITHSON.—On July 5, at Southcoates, York, John Smithson, L.S.A.L., aged 48.

WALLIS.—On July 5, at Dorchester, John Wallis, M.R.C.S.E., aged 93.

ON THE DIAGNOSIS AND TREATMENT OF SOME FORMS OF DYSPEPSIA. (a)

By Robert Farquharson, M.D.

Nausea and vomiting come next for consideration, and the sensation of sickness, with weight and distension after food, may simply be a protest on the part of the stomach against a greater amount of work than it can successfully accomplish. Perhaps the patient eats too much or too often, or the constituents of his diet are harsh and deficient of digestion, or the stomach itself is weak, or, what is a very common cause of dyspepsia, a deficiency of nervous energy exists. Probably some source of nervous exhaustion may be at work, or most of the available nerve-force has been directed into other channels by continuous hard work, mental anxiety, or the like, and may not be available for digestive purposes. Secretion then goes on badly, and more especially if we direct our attention strongly in other directions, as by reading or thinking deeply at meals; a too scanty amount of gastric juice will be thrown out to meet the necessities of the case, and ill-digested food will then set up intestinal disturbance.

Now we shall not have much difficulty in recognising this class of cases. Our patient complains of feeling nervous, depressed, and out of sorts, and is readily tired by comparatively slight exertion. He sleeps heavily, but wakes unrefreshed, his head feels confused, and he has some difficulty in focussing his ideas on a given point. After meals he becomes dull and drowsy, and his appetite, at first preternaturally keen, is satisfied with a few mouthfuls of food, after which nausea sets in. Nervine tonics and, more especially, nux vomica and strychnia, will here do us good service; and in conjunction with mineral acids, cinchona and capsicum will often go far towards restoring our patient; whilst a little alkali taken before his food may tend, on Ringer's principle, to augment the secretion of gastric juice. But suppose that vomiting sets in, and continues with such severity as to constitute itself a special symptom, and threaten serious weakening by exhaustion. What shall we do? See, in the first place, that the bowels are thoroughly unloaded, and then prescribe some effervescing medicine, with or without prussic acid; for, although I cannot withhold the conviction that this useful drug has been excessively over-praised as a remedy for sickness, and that its actual power in checking this condition is comparatively trifling, still the force of routine is so strong that it is still almost indispensable in these cases. But supposing this treatment fails, as it often will, we must try something else, and in ipecac. (whose marvellous power of checking the vomiting of pregnancy we all know and appreciate) we will find our sheet anchor.

Hannah Crow consulted me at the Western General Dispensary, for pain after food, with sickness and vomiting, and frequent distressing retching. Loses flesh rapidly, and is much weakened by the fact that every meal is brought up soon after being swallowed. Tongue red, and quite stripped of epithelium; papillæ much enlarged. After seven days' treatment by a drop of vin. ipecac. every hour, all nausea and sickness entirely left her, and only epigastric uneasiness remained, which was speedily cured by an alkaline mist.

Or, in case ipecac. disappoints us, we may try nux vomica also in small doses; and armed with these two remedies, and the judicious use of counter-irritation, we will generally succeed in relieving any ordinary case of pure stomach vomiting, recollecting of course the many pathological conditions of which this act may be the sympathetic indication. Flatulence, also, is a symptom which gives much annoyance, and which frequently arises from a deficiency of those secretions which have an antiseptic action over the contents of the intestinal canal, more especially the bile; and under these circumstances a little nitro-hydrochloric acid will have a good effect. But it often also results from the condition of nervous debility just described, and in which a generally flabby condition of mucous mem-

(a) Read before the Harveian Society of London, April, 1877.

brane concurs with deficient secretion, these tonics, and more especially nux vomica, and the more astringent forms of iron will give relief. For the mere relief of the symptom itself, we will find some benefit from nitro-muriatic acid, some from charcoal, but most of all from sulphurous acid, in half-drachm doses.

The opposite conditions of constipation and diarrhœa would deserve and repay very careful attention, but time will only enable us to direct brief attention to one phase of the question, and that is a condition in which looseness of the bowels comes on immediately after eating. "Everything," to use the patient's own words, "seems to pass through me." Now this consists no doubt in some irritable condition of the intestines, which prompts them to bring on the digestive act, and ordinary astringents will only make matters worse, but if we adopt Ringer's hint, and give small doses of liq. hyd. bichlorid., we will often obtain success, as in the following case :

S. C., æt. 28, consulted me on July 15, looking very pale, ill, and anxious, with a raised temperature, much epigastric pain and diarrhœa immediately following food ; states that she was quite well a week ago, and her general aspect almost suggested the possibility of typhoid, but 5 ℥ doses every four hours of liq. hyd. bichlorid. completely removed all her symptoms in three days.

Many more drugs might be enumerated which are indispensable in certain varieties of digestive derangement, but my object not being to supply a catalogue *resumé* of every member of the Pharmacopœia which has been summoned to our aid in these cases, but to furnish some suggestive hints from my own experience, I refrain from further detail ; and having done for our cases all that mere prescribing permits, we have now to consider what special dietetic rules we must lay down, and what points are of special importance as regards the limitation of excess, the supplement of deficiencies, and the correction of errors.

But this topic is of vast width and extent. Commonsense and the application of ordinary physiological principles will often prove sufficient to lead us on the right track, and there is assuredly no lack of carefully-constructed dietaries adapted for every age and condition and emergency of health and disease. We must, of course, beware how we turn our patients into mere hypochondriacs by impressing upon them too many regulations, and directing their mind so forcibly upon their digestive organs, that severe functional derangement may possibly run at last into organic disease. We know, or ought to know, the influence of what has been well called expectant attention upon the organs of the body, and how running the heart or brain or stomach perpetually into prominent mental consideration almost certainly sets something wrong. Therefore, we may not infrequently let people prescribe the main features of their diet-scale for themselves ; but on several points, when derangements of nutrition supervene, we must interfere, and I will only venture to refer to three points.

First, the indigestibility, under certain conditions, of fluid forms of diet. We shall often make a good hit in private practice by remembering this, and stopping the supplies of milk and beef-tea and nutritious slops, with which the victims of weak digestion are often drenched. Cut all this away, and allow only compact and moderate allowances of dry solid food, and we will find marvellous improvement and great development of faith. We will find that the nausea and flatulence and want of appetite will disappear, and a fresh era of health set in.

Secondly, we have to consider in how far dyspeptic symptoms are originated or kept up, by an intemperate use of meat. The experience of several eminent vegetarians, who recently favoured a sister society with a sketch of their principles and practice, show that the highest development both of brains and body, is thoroughly consistent with total abstinence from flesh. We know that the blood overloaded with nitrogenous products is liable to engender the development of gout and rheumatism, and other disorders, and Parkes has shown how an exclusively flesh diet will give rise to peculiar dyspeptic symptoms, with a tendency to papular and pustular eruption, foul tongue, intensely acid urine, and great mental depression. We see cases approaching to this in the servants of the wealthy, who are allowed to eat meat four and even five times a day, and in whom we observe a peculiar, pasty, greasy complexion, a dull eye, loaded tongue, sluggish bowels, and great inaptitude for exertion.

An eminent surgeon recently gave an interesting sketch of his own experience in this direction. About a year ago, he told his audience in St. George's Hall one Sunday afternoon, he felt himself breaking down, his sleep impaired, his energy of body and mind lessened, he was easily tired, and could no longer do a long stretch of work with ease. His friends thought him overworked, and counselled him to live well, but the more closely he followed this advice the worse he grew, and he began to fear that his best days had indeed gone by.

Coming now under the hands of an eminent physician, quite a different aspect was given to the case. You are eating, said he, a great deal too much. Your nervous energy is largely used up in your work, and is not sufficient for the additional strain placed upon it for your present digestive purposes. Eat much less, and especially much less meat ; and on complying with these instructions, the patient speedily lost his bad symptoms, regained even more than his old power of work, and since that time, as he graphically expressed it, he has never even known that he has a body.

Now, even although we may not absolutely accept the physiological explanation here given, there can be no doubt about the fact that too much meat was being here consumed, and that a reduction in the diet scale was speedily followed by the best results. Surplus nitrogenised material merely undergoes retrograde metamorphosis, becoming transformed into various secondary products, and injuriously oppressing liver and kidneys. In such cases we generally find the urine very acid, of high sp. gr., and either containing a large excess of urea, as pointed out by Dr. Fuller, or loaded with crystals of oxalate of lime, and this will be another aid to diagnosis, and another hint that too much animal food is being consumed.

But the other dietetic extreme may also be productive of derangement, and the great bulk and somewhat heating and irritating quality of such a diet as oatmeal is often productive more especially of flatulence and tendency to diarrhœa. It is a mere truism to say that a proper blending of both these classes of food is requisite to sustain large masses of men under the ordinary conditions of life in full health and complete efficiency.

Thirdly, and to conclude, one word about tea. Now a brief visit to any of our out-patient rooms will convince us of the full extent to which the evils of this substance are recognised, and we see physicians and clerks vying with one other in their efforts to stamp out the perilous practice of tea drinking. Now many patients will tell us quite spontaneously that tea causes pain and flatulence, but to others, again, its sudden withdrawal is a real and serious deprivation. We all know its marvellous restorative powers ; how it removes fatigue and stimulates nervous energy, and even seems to supply the want of food, or at least deadens the cravings of appetite. Are we then to deprive many poor half-starved women of their only solace, and will not the remedy or the remedial necessity, prove worse than the disease itself. Now in considering this question we are at once met by the undoubted fact that we know very little about the action of tea itself. Physiological inquiry has elicited some experimental results of the administration of the alkaloid to the lower animals, and we know that strong tea will prevent sleep and cause palpitation and many uncomfortable nervous sensations. But in the case of the poor, who suffer most from excessive tea drinking, the active principle of the plant may practically be left out of conside-

ration. A weak infusion of tannin and other vegetable constituents drank hot, and in large quantity, and at frequent intervals, must necessarily spoil appetite and impair digestion, by precipitating and unduly diluting the gastric juice. So we must check the habit altogether, if necessary, and at all events, keep it within moderate limits; and in the case of the more wealthy we may have cause to remonstrate against those modified meals which, under the familiar name of afternoon tea, too often seriously imperil the prospects of a good dinner later on.

And now, gentlemen, I have come to the end of my somewhat discursive remarks, and leave the subject without further apology or comment in your hands. The practical experience of many of my hearers will, no doubt, supply many instructive and suggestive points for future consideration, and to facilitate discussion, I will conclude with a very brief *resumé* of my paper, under the following headings:—

1st. The condition of the tongue in dyspepsia.
2nd. Varieties and treatment of pain.
3rd. Treatment of nausea and vomiting.
4th. The dyspepsia of fluids.
5th. The influence of an over-nitrogenised diet.
6th. The influence of tea.

MATERNAL IMPRESSIONS.

By John G. K. Synnott, L.F.P.S., L.S.A.,
Sowerby Bridge, Yorkshire.

The influence of external impressions in arresting the development of the fœtus, has been often recognised, and however difficult of explanation it may be, and however much we may differ as to the relative bearing of the supposed cause in the modification of the embryo, it must be agreed there is something singular in the cases already recorded, to which I add a contribution.

On Monday, July 2nd, 1877, I attended Mrs. G., æt. 26, Cote Hill, Warley, in her second confinement.

There was nothing particular about the process of labour, either as regards presentation, progress, or delivery, and a fine child was born; but though a fine child it had only one hand, the left being absent—development arrested at the wrist.

It presented the appearance of having been taken off, and subsequently healing: there was a perfect flap.

She informed me that when she was pregnant about two months she was working in a mill at Dewsbury, and her left hand was caught and crushed in some machinery, and she experienced at the time a considerable shock to her system. The child may be seen by any one interested in such inquiries, or who may desire to trace the influence of cause and effect in the production of such *lusus naturæ*.

I may observe if the stump had been the presenting part, it would have afforded the accoucheur a very good subject for speculation as to what part of the body it really was; and unless he bore in mind the possibility of a monstrosity, he would have some difficulty in deciding on its anatomical relations.

This brings to my mind two other cases. One, Mrs. S., London, who was delivered of a child, minus its arm; she assigned as the cause her having been annoyed by a man who had lost his arm.

The other was more singular, and was seen by me on board one of the American boats, on my passage to England.

It was the case of a little boy who had on the calf of his leg the outline of the form of a rat, with hair, head, body, and tail well marked and stamped thereon. When the mother was *enceinte*, she was alarmed by a rat jumping upon her leg, and the child was born with the above-mentioned mark upon its leg.

Nervous influence has, we know, an important part to play in the process of conception. It is not easy to understand the *modus operandi* in such cases, but there are too many of them to be lightly passed over, amongst which not the least interesting or extraordinary are the three here recorded.

Clinical Records.

CHRONIC MENINGO-MYELITIS (RHEUMATIC) INCIPIENT SOFTENING—CURE.

Under the Care of Thomas Stretch Dowse, M.D., F.R.C.P. Edin.,
Late Physician-Superintendent of the Central London Sick Asylum, Highgate; Physician to the North London Hospital for Diseases of the Chest.

C. C., æt. 47, came under Dr. Dowse's care, with general paralysis of the extremities, but more especially of the lower limbs; states that his health was good until two years ago, is a strongly built man of temperate habits and free from syphilitic history. At this time his health began to fail, he lost appetite, and was unable to hold his water; "he remarked that when in the street if he made an attempt to micturate he was unable, but when he moved on it would come from him with full force and he was unable to retain it." This continued for some time and was associated with mere weakness of the lower limbs, cramps of the muscles of the calves, and absence of power of the exigent nerves. In the month of February, 1876, he suffered from what was considered to be an attack of rheumatic fever, after which he sweated profusely upon the least exertion, and whenever he became excited he trembled violently as well as suffered from voluntary jerkings of the legs. When he came under Dr. Dowse's care, the following points were noted. Of fair florid complexion, looks quite young for his age, and at times seems confused; the memory is not so good as formerly, there is no pain in the head or feeling of giddiness, the bowels act regularly with normal control over anal sphincter, but not over vesical; he walks fairly well, but complains of feeling weak in the joints; no defect of cranial nerves, complete absence of the signs associated with locomotor ataxy, and except flying muscular pains, the arms are weak and at times feel stiff. There is great loss of temperature in the lower limbs. Reflex movements are readily engendered upon tickling the soles of the feet. Automatic movements are at times very troublesome, but more especially at night when going to sleep. Voluntary power co-ordinate but defective. He can raise (whilst lying on his back) only sixteen pounds with the left and twelve pounds with the right leg. Cutaneous sense and sensibility normal. Subjective sense as though the legs were wooden. Muscular development impaired, no fibrillation. Muscular sense, normal. Cutaneous sensibility became appreciable to twelve cells, v. Stohrer's battery, in sixty seconds on the left leg, and to twelve cells in thirty seconds on the right. Electro-muscular movement to thirty cells of the left, and to twenty cells of the right. The urine was acid, gravity 1020, and free from albumen. The spinal column straight, and free from pain upon percussion.

The treatment first adopted was phosphorus in pills, and the ammoniated solution of strychnine, the continuous current to the legs every other morning, and an injection of 1-12th gr. of strychnine into the muscles daily. This was continued for three weeks with some improvement, but the reflex excitability of the cord was so greatly increased that it was found necessary to inject at the same time with the strychnine the 1-20 grain of atropine. At the end of a month he was decidedly stronger, he could raise twenty-eight pounds with the right leg and eighteen pounds with the left, yet it was

apparent that some blood condition existed which kept in action the moist condition of the cord, and which was not controlled by either strychnine or phosphorus. He was then ordered the following draught three times a day, with four grains of grey powder and three of quinine every other night.

℞ Salicine, gr. x.;
Potass. bromidi, ʒj.;
Potass. iodidi, gr. xx.;
Tinc. gelsemin, ʒjs.;
Aqua, ʒj.

with entire absence of stimulants. In a week after this he could raise thirty pounds with each leg, and improved gradually in every way. At the end of June he was discharged quite well.

ON A CASE OF CHOREA.

By Octavius Sturges, M.D., F.R.C.P.,
Physician to the Westminster Hospital; Assistant-Physician Hospital for Sick Children, Great Ormond Street.

Rebecca N., æt. 5, the youngest and weakest of five children, was admitted into Westminster Hospital, May 5th, 1877. She is very intelligent and sensitive. A year ago she had whooping-cough badly, the other children escaping. Two weeks ago she complained of headache, and objected to go to school; on the way thither she suddenly screamed, in the mother's words, "as though a dog had bit her, although no dog was there." On the following day it was observed that she moved the right hand restlessly. The mother attributes the attack to "too much study." The child has not been frightened nor complained of pain, except on the occasion just referred to.

The patient is somewhat anæmic, fairly nourished, with very mobile features and emotional temperament. The tongue is protruded steadily; there is no sign of ill-health. When placed in bed, however, the child's right hand and forearm and, to a less extent, the right foot are found to be restless, the disorder being strictly confined to these parts; the face movements, also considerable, are yet not in excess of those often observed in sensitive and self-conscious individuals. The choreic movements are to some extent under control and are most when under observation, but by no effort of will, although this is evidently exerted, can the child keep the right hand still. In her attempts to do so she will rest it upon some support or clench the fist or let the hand droop from the wrist, and in these positions it is nearest to stillness. Extended and without support it is the most restless. The movements of the foot, and in a measure of the whole leg, though obvious enough, are much less marked than of the upper limb. The child at first had imperfect command of the right leg, and was apt to fall; soon, however, she could run about with no noticeable defect in gait. There was no chorea whatever of the other limbs.

At first it was noted that the heart sounds were natural, but subsequently, during the time of listening, a distinct regurgitant mitral brûit became audible, which continued for a few beats and then disappeared. This condition of things was verified on many occasions by several observers, though the murmur was more often absent than present. It was the more striking because, unlike the soft and so-called "hæmic" or "anæmic" bruit common in chorea, this blowing sound made its presence at once obvious, and would suddenly break in upon the ear whilst listening to what seemed a quite normal first sound, and then as suddenly disappear. It was thought that muscular exercise tended to develop the morbid sound, but of this I was by no means certain.

This case is quoted as possessing interest on the following grounds:—

1st. The affection began in the right arm and hand, whence it extended to the leg and foot of the same side.

2nd. Mitral regurgitation was an occasional phenomenon, the heart's action as a rule being normal.

3rd. In its full development the disorder was confined to the right side, the arm and hand suffering most and longest.

I. As regards the first point, information is often wanting in reported cases of chorea as to the limbs or muscles first attacked. It is notorious, indeed, that the upper limbs suffer more than the lower, and that a very common mode of extension is from one hand or arm to the other. It is further certain that the limbs which yield earliest and oftenest to chorea are those which are most easily affected in ordinary emotion. Now, assuming the movements of chorea to be due to mental impression, or rather selecting those instances of it which are most certainly of that origin, it is of interest to inquire whether the starting-place of the disorder is at all determined or modified by the particular character of the injurious impression.

When *pain* is the immediate precursor of chorea the painful limb is often the first to become unsteady. When also a particular set of muscles are fatigued these are apt to suffer more than the rest. Upon the same principle it is possible that chorea may be right or left, according as the limbs of one side or the other are the more tried. In a case like the present, for instance, due, as the mother believes, to "over-study" (study in this particular instance meaning the training of the right hand to write and do needlework), the unequal exercise of the hands may be the cause of chorea beginning in the right. If this be so we should have for children of this sort a large preponderance of right-handed chorea. But there is certainly no such preponderance on the whole. It is asserted, on the contrary (I know not on what evidence), that left-handed chorea is somewhat the more common. The facts would therefore require that, except for school discipline (which contributes largely to chorea), the left hand should be much more prone to the disorder than the right. This, too, might be accounted for on the supposition that children mentally or emotionally over-taxed, yet so young as not to know right from left, but using both alike, should suffer disorder of that side which by long inheritance was the least subject to control—that is the left. Left-handed chorea would thus be the rule of commencement; yet special circumstances would often interfere, and especially the overtaxing of the right hand in schooling or any nervous strain which appealed to the one side rather than the other. The offended member would be the first to suffer, whether right or left; or, if there were no special offence to one limb more than another, the limbs would suffer either all together or in the order of their instability.

Now the various sources of terror, according to their nature, bring into sudden and unexpected exercise various groups of muscles—where the terror is such as to suggest escape the legs are thus tried, not only by their action in flight, but by the sense of fear which stimulates that action to the utmost, and gets mentally associated with it afterwards. In other cases it is the upper limbs that are most engaged, one or both, as where the act of grasping, or shielding or striking can save the threatened catastrophe; and here too there is more than the mere muscular effort—there is the sudden shock which, in an instant, before the arrival of alarm, stimulates certain muscles to an extraordinary exertion. The movements to avoid a blow or recall a step (as in the precipice-walking of some dreamers), or to escape some disgusting contact, are of this kind. They communicate a shock of their own, and so much do they anticipate any conscious volition that they will save from danger which the mind does not realize till afterwards, as though separate territories of the muscular system kept a watch of their own for the common preservation. And not only so, but the muscles thus suddenly called into action will be agitated apart from the rest, both at the time and afterwards. The recollection of the incident will recall the muscular no less than the mental part of it, and often so powerfully as again to produce actual movement. Even when there is no grave disaster, but only some pleasurable act to recall, the face will resume the expression of the moment, the hand will repeat its past performance, the

fingers will itch for their former employment, the feet move to the old measure.

If the reader will but recall the common causes of chorea (and I need speak now only of that which is admitted to be of mental origin) or read some tabular enumeration of them, as, for example, that appended to Dr. Dickinson's article upon chorea (*Med.-Chir. Trans.*, vol lix., pp. 30, 31), he will find a list of terrors calculated to produce particular muscular movements—"frightened by a dog," "butted at by a goat," "chased by a cow," "nearly run over," &c., &c. My conjecture is that the manner of the chorea in these several instances would be in accordance with its mode of origin (other things not interfering); that certain groups of muscles would be mentally impressed more than others, and become choreic in consequence.

I have had charge of some cases lately which help to bear out this view—which have, indeed, suggested it. A boy of eleven was much alarmed by an explosion of gunpowder which slightly scorched his face. He got choreic twitching of the eyelids which ceased after a course of shower-baths. A boy of six was frightened by a dog suddenly jumping up at him; he got chorea of the hand on the side of the dog's approach. A girl of eleven, stooping to pick up, as she thought, her brother's cap, found to her great alarm that she had seized a dead rat. She became choreic in the offended hand (the right), and so violently that, although the general chorea which followed was not severe, the hand that had been used was so affected that by no effort could it be kept still.

A very large number of cases would, of course, be needed to verify the hypothesis which I am now assuming to be thus illustrated. To vindicate the principle, however, it is not necessary that the muscles chiefly assailed should *always* be the first to suffer, or, indeed (failing any such local assault), that the natural order of muscular surrender should *always* be followed. There are many interfering circumstances to modify the law, if law it be. Thus, the presence of danger may fail to excite a suitable muscular movement, and produce instead a general paralysis, and presently a general chorea; or the muscular act that would seem the most appropriate may not be that actually suggested to the patient, or the chorea which the fright excites may be but the revival of a former attack, and, as such, obedient to its old form. In such circumstances the law is not broken, but superseded. When the fullest allowance has been made for such exceptions there will still remain material enough upon which the principle may be tested.

II. A word may be said as to the intermittent character of the heart-murmur in the present case. This is no new observation. For the heart's action to be uneven or irregular, for its bruit to come and go, or be present in one attack and absent in the next, these are common features in the chorea of childhood. What is unusual is this: that the mitral valve should permit regurgitation for a moment or two, and then revert to its normal action, and that it should be in the habit of faltering in this way. This phenomenon, rendered the more obvious in this instance by the distinctly blowing character of the murmur, lends support to the view that in chorea the earliest defect of the heart is due to muscular disorder, and not to any structural change; "that," as Dr. Dickinson expresses it, "the collection of fibrin is the consequence, and not the cause of the regurgitation."

It has been fancifully supposed that unevenness of rhythm, which is often the earliest signal of heart disturbance in chorea, might be in some measure due to the irregularity (which is sometimes extreme) of respiration and unequal delivery of blood from the lungs. It is enough to say that facts do not support such a doctrine. It so happened that, along with the child in question, whose breathing was little disturbed, was a boy of nine, in his third attack of severe and general chorea, affecting very markedly the muscles of respiration. He had no irregularity of heart and no murmur. The liability to heart implication in chorea is not to be estimated by its severity, or seat, or class of subject. It appears, however, to depend somewhat upon age. As the patients grow towards puberty and chorea becomes rarer—representing, for the most part, the out-lasting or revival of the child's disorder—so does the heart affection become rarer too, and with adults this liability seems to disappear.

III. However we may account for chorea commencing in a single member and spreading thence to the others, we have yet to account for its remaining strictly one-sided, as in the present instance. It cannot be supposed that the limbs of one side of the body are naturally less stable than of the other, nor yet that the whole of one side should be subjected to the kind of strain I have been speaking of as applicable to particular limbs. Both the principle of successive surrender of muscles, and the principle of some localised offence (so to call them) fail us, therefore, when we come to consider what has been called *hemi-chorea*. And we are in this dilemma, that while some explanation is required for such cases, none will serve which does not both account for the fact and account also for its being exceptional.

In the present instance, although the disordered movement was confined (so far as the limbs were concerned) to one side of the body, the chorea in other respects was not exceptional. It spread from limb to limb as usual. The hand and arm suffered first, and afterwards the foot and leg. It is very rare, I believe, for hemi-chorea to happen in any other way than this. The comparison with hemiplegia, which the term suggests, is apt, therefore, to mislead. There is no such thing as a "stroke" of chorea where the whole of one side is stricken at once, the face as well as the limbs. Nor does it ever happen in one-sided chorea, so far as I know, that the face-muscles are choreic on one side only. It may be added that rheumatism and valvular disease are not more common with this than with other forms of chorea. What has to be explained, therefore, is not the sudden seizure of one side of the body, for no such thing happens; it is the fact that chorea, spreading as usual from limb to limb, is yet confined to the muscles of one side.

Now, inasmuch as chorea is often partial, why, it may be asked, should it not happen sometimes that the limbs chosen belong to the same side of the body? The reason has been given. The arms and hands yield naturally to chorea with much greater readiness than the feet and legs; so that unless both arm and leg of one side have been subjected to overstrain—an event which can seldom happen, and which, in most instances of the kind, is known not to have happened—one-sided chorea is an anomaly.

May it not be in these exceptional cases that the leg suffers in sympathy with the arm because the brain lesion which the arms' over-exercise has induced implicates a region whence both arm and leg derive their motor functions. In such a case as the present, for instance, the leg becomes choreic (later than the arm and for a shorter time), not because it has shared in the overstrain of the arm—for this is clearly not so—but because both arm and leg depend for their motility upon the integrity of a common centre. Some exceptional irritability on the part of this latter permits the disorder of the upper limb to be reflected forthwith to the lower. The rule by which chorea spreads from side to side in obedience to the same law which makes the several muscles responsive to ordinary emotion in a certain order is thus interrupted, and the disorder spreads, not from one arm to the other as usual, but from the arm first affected directly to the nervous centre, whence it is next communicated to the leg of the same side.

Whether this or any similar hypothesis can be maintained must depend, of course, upon the analysis of many cases where the mode of commencement and order of progress of the muscular disorder have been carefully observed. Unfortunately, examples of one-sided chorea, quoted for the most part in support of an antecedent conclusion, are not always related in such detail as to be of service for this purpose. With the comparative rarity of the event, therefore, the material at hand is far too scanty at present for any conclusion.

MERCER'S HOSPITAL, DUBLIN.

Under the care of MR. O'GRADY, M.B., F.R.C.S.I.

DURING the second quarter of the year (April to June), amongst the late patients who had been under Mr. O'Grady's care in this institution, and whose cases having concluded were "discharged," the following, illustrative of various conditions of pathological and traumatic surgery are briefly noted.

Amputation of Thigh (two cases); ditto of Breast, with removal of several Axillary Glands. Extirpation of Eye for Injury; ditto for extreme displacement, together with removal of large Orbital Tumour connected with the Lachrymal Gland. Two cases of Cleft Palate operated on. Broken Leg which had united with much deformity operated on by division of the bone by the chisel and refracture. Immobility of the Tempero-Maxillary Articulations. Strangulated Hernia. Calculus, with Stone adherent to Wall of the Bladder. Lithotomy. Removal of large Tumour of Face, with excision of Left Malar and Superior Maxillary Bones and part of Right ditto. Necrosis of Tibia. Cancer Lip. Complicated Stricture of Urethra. Fracture of both Forearms, one being compound. Compound fracture both bones Forearm. Wound, Penis, from bite of a dog. Successful application of "Elastic Ligature" for removal of a sloughing and bleeding prepuce in a "Bleeder." Consolidation of a large Ilio-Femoral Aneurism.

In the two cases in which amputation of the thigh had to be resorted to both recovered, though in one of them after the patient had been fairly convalescent with healed stump, having been for some time going about on crutches, and on the verge of leaving the hospital, peritonitis suddenly occurred, its course becoming complicated with hæmaturia and gastritis, under which the patient, a delicate, strumous lad, whose thigh had been amputated for chronic knee disease, eventually succumbed, more than two months after the operation. The other thigh amputation was in a middle-aged, unhealthy-looking man—a working jeweller. He had met with an accident twenty years previously; this resulted in permanent deformity of the joint and atrophy of the leg. More recent injury, consequent on a fall, lit up further mischief, and necessitated the removal of the limb. This man made an excellent recovery, leaving the hospital in a month, and speedily regained good health. In both cases the mode of operation selected was the long square cut, anterior flap, short posterior ditto. The vessels being secured by carbolised cat-gut, and adequate provision made for draining the stumps from the centre.

The breast amputation occurred in the person of a spare but healthy-looking single woman, 35 years of age. The morbid part, though adherent to the skin and muscular fibres beneath, with several of the axillary glands also affected, was of limited extent, and it was determined in consultation to accede to the patient's desire for operation. Irregularly elliptical incisions above and below with a straight cut prolonged from their outer angle of junction readily enabled the breast and other morbid parts to be got at and removed. The wound healed kindly, the mammary portion mostly by first intention, the axillary prolongation by healthy granulation, the patient being able to leave the hospital in three weeks.

The two cases of eye extirpation occurred under widely different conditions. In one, a delicate looking lad, aged 14, was admitted for severe wound of right eye and upper lid occasioned by the bursting of a soda water bottle in the factory he was employed at. After enucleation he progressed favourably. The other patient, a girl of the same age, was admitted at the end of May for a very hideous deformity, the result of a large orbital growth, distending the lids and pushing the eye forward, the projecting mass equalling in size half a large orange, sight utterly lost. According to the girl's account, she had given herself a slight knock on the nose a month previously; in a week after, the tumour began to be observed and rapidly increased; it proved to be partially encapsuled and was inseparably connected with the lachrymal gland, which likewise had to be taken away. In removal, the outer canthus had to be slit far back to the posterior limits of the projecting mass; this incision was brought together by twisted sutures, and the wound simply dressed. Progress was very satisfactory, the cut healed without appreciable mark, the deep chasm the while filling nicely, the patient being sent home in less than a month apparently well. The microscopic report as to the structure of the removed growth has not yet been obtained.

Some interesting instances of reparative surgery offered in the two cleft palates, and a mal-united leg. This last was in the person of a pretty and intelligent girl, seven years old. Two and a-half years previously when with relatives in the country, she broke the left leg, both bones, and was allowed to lie without professional aid. The resulting deformity was very great, a "knee" (the angle of the broken bones, which were fairly consolidated with deposit of exuberant callus, was about two-thirds of a right one) in the inferior fourth of the leg. On the 10th of May, the tense and curved tendo-Achilles was first divided, and the tibia then nearly cut through by a specially designed chisel, the fracture of the bone being completed by a screw-clamp. The deformed fibula was easily broken by the mallet, when the limb was got into good position, of full length, free from deformity, and was so put up—one of the hospital fracture boxes, slightly modified for the special purpose, answered to perfection for the subsequent treatment. Nothing could be more gratifying than the after progress, the wound healed rapidly, in less than a month the little patient was up on crutches. She left the hospital on the thiry-fourth day with her leg perfectly restored to its natural length and appearance. It was only after careful examination one could tell which had been the damaged limb.

Of the two cleft palate cases, one resulted in perfect success, the other only partially so. The subject of the former was a girl eight years of age, operated on June 1st. The cleft was a large one, involving the entire length of a deep soft palate; the resistance of the little patient made it a matter of no small trouble to get the edges properly pared and the sutures adjusted. Excellent union took place, the patient being able to return home in a few days freed from her trouble, the time of union being scarcely perceptible. The other palate case was that of a delicate looking young woman, a dress maker, twenty-one years old. The fissure here, too, occupied the entire soft palate, the structures of which were exceptionally scant and stretched, the hard palate being high and arched. The first couple of days appearances were most promising, but the upper part of the wound opened afterwards, though the lower healed well. Business engagements prevented the patient remaining at the time for further operative measures for which, however, she promised to return some latter date, when probably with the vantage ground already gained, there will be fair prospects of success. In both cases the flat muscles of the palate-veil together, with the palato-glossus, and palato-pharyngeus, on both sides were divided so that the freshly pared edges of the clefts were held together, without any tension, by the sutures.

Connected with the surgery of the mouth another interesting case was under observation during the major part of this quarter. A healthy active lad, now nine years of age, was said to have fractured his skull by a fall some five years previously. At that time he was for a long period under the care of the late Prof. Morgan. This accident was followed by stiffness, gradually running into fixed immobility of both tempero-maxillary articulations; the lad's lower jaw seeming to be absolutely locked. Whilst profoundly under the influence of chloroform a little separation was gained by a screw-dilating gag, the points of which were introduced where a gap existed in the teeth, and whilst it was still *in situ* a fine hickory-wood wedge was inserted. This proceeding was frequently repeated with progressive use of larger wedges,

a gradually enlarged opening being obtained with increasing power of mobility. After a time the lad was able to leave the hospital, and attend occasionally as an extern patient, improvement continuing, and there being a good prospect of eventually securing a fairly moveable lower jaw.

In three cases death followed operative procedures. In one of these cases, however, the fatal issue was from a cause quite unconnected with the malady which had called for the operation, and which, as such, seemed likely to have been successful. This case was that of a man, stated to be 67 years of age, but looking far older, admitted for a large inguino-scrotal hernia of the right side—on this occasion only a day "down." The symptoms being very urgent and calling for immediate interference, the operation was proceeded with without delay. The man suffered severely from chronic bronchitis, the wheezing and râles were audible throughout the large ward. Prostration was very great. His state was such that it was considered inadmissible to give any anæsthetic, and the operation was performed as he lay in bed warmly clothed. It was necessary to open the sac; some difficulty was experienced in returning the large mass of protruded gut, different bands and strictured points having to be first divided. Ere the dressings were completed, the patient fell into a sound sleep. As regards the hernia trouble, progress from the first continued to be all that could be desired. The chest symptoms, however, became worse and worse, the patient succumbing after three days. A complication, fortunately of very exceptional occurrence, was followed by death in a case of lithotomy. A healthy-looking man, aged 67, was admitted for stone—having suffered severely from urinary trouble for four years. Examination showed the stone to be of a large size, and the case generally not one for lithotrity. Lateral lithotomy was performed on the 21st April. The calculus proved to be adherent to the bladder behind the pubes, and so intimately, that spite of every care in its detachment it carried away with it a small portion of the mucous coat. The old man soon complained of belly-pain, got severe peritoneal attack which carried him off in forty hours. Urine came abundantly by the wound throughout.

The other unsuccessful case was that of removal of malar and upper jaw-bones of left side, together with part of the alveolar and palate portions of the right one, for a huge growth which extensively invaded these bones, and had caused much displacement of the eye. The patient was aged 46 years, but looked fully ten years older. An incision running beneath the orbit, carried well back to over the posterior limit of the growth, and continued from its front extremity along the side of the nose into the nostril, and through the upper lip, gave, on reflection of the flap, ample room for dealing with the deeper parts. The integument had so thinned from excessive over-distension that uneasiness was felt as to its retaining vitality. The operation being completed the wound was closed as usual in such cases. During the first two days the progress of the case seemed re-assuring; on the third he fell off, grew comatose, sank, and died in the evening. The external appearance of the wound after death, all pins and sutures having been removed, showed that the integuments had everywhere resumed a healthy appearance. The entire wound, except a quarter of an inch at the ala of the nose, had united well—the line of union being in places almost indistinguishable, and so soundly were the parts united that traction with the fingers failed to separate them. The eye, too, had resumed its normal position, and regained a healthy appearance, so that had the patient lived the result would likely have been one remarkably free from deformity. The foregoing case presented an interesting contrast with one which had been but lately in the hospital, and where the happiest results had followed the operation on the jaw. (*a*) Of this patient's present condition "good accounts" were lately received.

(*a*) *Vide* issue of MEDICAL PRESS AND CIRCULAR for 14th of February.

An interesting example of extensive stripping of the tibia in connection with syphilitic ulceration was dismissed from the hospital early in April, in the person of a girl, aged 15, who had been under treatment there for several months. A minor operation so long previously as the preceding November for the removal of some scales of bone showing through the ulcer demonstrated the tibia to be completely isolated from its periosteum throughout the entire circumference for more than seven inches of its length. On this occasion some diseased surface was gouged away. The interspace suppurating profusely the girl became so reduced that the propriety of amputation, which she herself desired, was anxiously considered. After a severe attack of erysipelas rapid amendment followed by complete healing (without any fresh exfoliation of bone, other than the portions alluded to as having been removed) took place. The girl was lately seen with a healthy limb.

A very extensive cancer of lips involving right angle of mouth was operated on. Caustic potash being applied to the site of a slight adhesion to the periosteum of the jaw, the upper part of the wound, that nearest the mouth, healed by direct union—but the delay consequent on the complete separation of the caustic slough, and the subsequent healing of its site by granulation, necessitated the detention of the patient in hospital for nearly a month, when he left well pleased with his state.

Amongst other cases of stricture of the urethra was one where a multiple stricture was complicated by a canal or passage starting from the urethra, deep down, running over to the left. This extended far enough to receive to their full length the various instruments passed. For a considerable time the existence of this channel baulked all attempts to get an instrument into the bladder, which was only accomplished by dilating a stricture situate anterior to the opening of this canal sufficiently to allow of an instrument large enough to fill its orifice being introduced therein; and whilst the abnormal passage was so occupied, a fine guide was got into the bladder, and over it a small catheter slipped in. Without much further difficulty, the case was treated to the admission of a No. 10.

The somewhat unusual occurrence of fracture of both fore-arms—presented in the person of a feeble, unhealthy-looking woman, æt. 50, who had fallen down a ladder-stairs, and, besides a scalp wound and several contusions, had also got double Colles fracture, the injury on the left side being compound—both limbs were treated on the "pistol splint" with good result. Three days after admission she had a severe attack of erysipelas of head, face, and extending to upper part of the trunk, which she slowly and with difficulty pulled through—eventually, however, recovering perfectly. No erysipeloid manifestation whatever showed in connection with the compound fracture.

Another compound fracture of the fore-arm was also at the same time an inmate of the hospital. The patient, a woman, æt. 35, whilst driving a dairy-cart, was pitched out, fracturing the left arm some inches above the wrist, the lesion to the ulna being badly compound. Severe diffuse inflammatory mischief supervened, as a sequence of which the radial fracture also became compound. The soft parts were much infiltrated, and repair was slow, union being long delayed; but eventually a good result was obtained.

A somewhat peculiar case of injury of penis presented. A man, æt. 29, was admitted for a lacerated wound of the glans, which had just been caused by the bite of a large dog. The hæmorrhage was free, but once a full-sized instrument was got in (a somewhat troublesome matter to effect, owing to the puckered condition of the orifice) it was easily commanded. The man was seen some time after leaving the hospital; the parts had now healed, a depressed cicatrix partly occupying the face of the glans. The man said the existing loss of substance was solely due to the injury, and that he had never had

syphilis. The urethral orifice was then free, easily admitting a full-sized instrument.

There was also another case of hæmorrhage from this organ in the person of an intelligent young man, a sailor, who had a sloughing sore of prepuce; when he came under observation, the glans having ulcerated through. The edges of opening constantly wept blood. Nitric acid and other means failed to check the hæmorrhage. From the man's statement, it would seem he was a "bleeder." The diseased and pendant portion of the prepuce being made tense, the thick ulcerated "neck" was surrounded, as near the penis as possible, with a piece of "elastic ligature" tightly tied. This stopped the bleeding, and in three days the morbid part fell off and the sore healed kindly, the appearance of the penis being quite comely.

Illustrative of how surgical aneurisms may occasionally become consolidated under the most unfavourable and unpromising conditions, there was a notable example:—A cooper, aged 28, came to the dispensary on the 8th of March, complaining of fistula in ano. He incidentally alluded to a "vein in the groin," which examination proved to be an ilio-femoral aneurism. It was crossed at the centre by Poupart's ligament, the surface being covered with a number of flattened glands; numerous glands were also in the other groin. The man was a habitual drinker. There was a doubtful history of syphilis. He laboured also under bronchitis of the most aggravated form. Internal treatment and dietary arrangements were carefully attended to; the strictest repose in the horizontal posture being also enjoined. A "shot-bag," the weight of which was gradually increased, was kept as constantly as possible over the aneurismal tumour. In the middle of the month there was a diarrhœaic attack. Against the 20th much relief had been obtained as regards the chest trouble, the aneurism, too, being rather better. On two occasions an "Esmarch's bandage" was applied—once for half-an-hour, the other time for an hour, having at each time to be removed on account of the pain, which was so severe that patient would not allow its use again. The tumour, however, seemed now to be becoming firmer. Though in feeble health the patient left hospital on the 23rd. Whilst at home he is understood to have treated himself by a leaden weight, and to have improved further. After a time he got tired of nursing himself, and went in for a spell of work—cutting barrel heads [the pressure of which on the groin he described as very severe, and had blamed it for causing the aneurismal disease]. In a week he thus earned £4, which was spent on drink during the ensuing five days, when he presented himself at the hospital one afternoon at the end of April in a state of threatening *delirium tremens*. The aneurism was now perfectly consolidated and cured. After a very short stay he was again able to leave the house.

Transactions of Societies.

DUBLIN OBSTETRICAL SOCIETY.

THE Seventh Meeting of this Society was held on Saturday, May 12th, 1877, Dr. T. MORE MADDEN, Vice-President, in the Chair.

There was an unusually large attendance of members. After some discussion a resolution was—by 19 to 9 votes, on the motion of Dr. KIDD, seconded by Dr. ATTHILL,—adopted to the effect that the subscription of the members to the Society should be raised from 10s. to £1, and that that rate of subscription should come into force from the commencement of the next session.

Dr. ATTHILL exhibited a recent specimen consisting of an ovarian cyst which he removed on Wednesday last in the Rotundo Hospital. The patient was a young woman, æt. 19, and her history was that somewhere about a year previously, although her health was good and menstruation normal, she perceived her abdomen enlarged. About October last, she was tapped by Dr. Rawson, of Carlow, and on two subsequent occasions she was tapped by another medical practitioner, the last time about three months ago. Since the last tapping the patient's abdomen had enlarged very rapidly, and on admission to the Hospital about a fortnight since, she measured over forty-eight inches round the abdomen. Her general health remained good, and menstruation continued normal. The uterus was small and moveable, and an examination of the abdomen clearly indicated the existence of a large ovarian cyst, which was diagnosed as unilocular. After consultation it was decided to remove the tumour. The operation was performed on Wednesday last, and proved to be one which presented no great difficulty. The cyst was exposed and tapped, and the fluid evacuated without the escape of one drop of fluid into the abdomen. He did not think that from first to last the patient lost two ounces of blood, if so much. Ether was the anæsthetic used, and was administered by Mr. Ormsby in his new apparatus with the greatest possible success. Two ounces of ether were consumed; there was no vomiting, and the patient had had no unpleasant symptom since; nor had she had any pain or discomfort. The sutures were removed that morning. Dr. Atthill believed the case would have a very favourable issue indeed. The cyst was now in reality very much smaller than it was previous to the operation, and the members would see that it was unilocular. He should mention that there were no adhesions anywhere except slight adhesions to the omentum which were cut off.

Dr. MACAN read a paper on

A CASE OF INVERSION OF THE UTERUS.

The patient was forty-six years of age and unmarried. Menorrhagia first appeared fourteen years previously, but for the last six years she had enjoyed very good health. Sometime previously she had taken a long walk, and on her return home a tumour appeared at the vulvæ. She was then seen by Dr. Ryan, of Emly, co. Tipperary, who diagnosed inversion, and tried on two occasions to reduce it. When Dr. Macan saw the case the tumour was sloughing, and the woman showed some symptoms of septicæmia. Having removed the tumour with the wire *écraseur*, Dr. Macan brought the edges of the wound in the uterus together with three silk sutures in order to stop the hæmorrhage. He then made an attempt to reduce the uterus, but failed, and it was then determined in consultation to remove the organ. This was done with the wire *écraseur*, and the two lips of the inverted cervix brought together with three silk sutures, which prevented either primary or secondary hæmorrhage, and which Dr. M. thinks probably lessened the chance of subsequent general peritonitis. The patient's convalescence was tedious from the occurrence of frequent attacks of diarrhœa, but she was removed to her own home within a month, and from that time improved steadily. The suture did not come away for two months. Dr. Macan also drew the attention of the Society to a new method of removing the inverted uterus, viz., by the elastic ligature. The account of a case in which it was thus removed by M. Courty may be found in the *Obstetric Journal* for March, 1877. He also quoted a case related by Dr. Dibardier in the *Annales de Gynécologie*, for Jan., 1877, in which a widow is said to have been cured of inversion of the uterus of thirteen years' standing by getting married a second time and becoming pregnant.

The VICE-PRESIDENT said the Society were very much indebted to Dr. Macan for the paper he had read. The operation was one of the boldest it gynæcological surgery, and the fact that cases of the kind were so rarely met with, enhanced the interest of the paper. He (Dr. More Madden) had seen but three cases of inversion of the uterus, in one of which he succeeded in the attempt to replace the organ, and in the other he did not succeed in doing so, but he had not had the courage, which Dr. Macan had, to remove the organ. He thought they ought to be very cautious with regard to removing the sutures.

Dr. KIDD had seen four cases of complete inversion of the uterus. The first was a case which Dr. M'Clintock had placed upon record, and which he had allowed him to see; in fact, he might say he had seen five cases. The first one to which he alluded was where there was a tumour growing from the fundus of the uterus, and the uterus was inverted by the dragging of the tumour. He saw another case with Dr. M'Clintock, where inversion had followed labour; there was no tumour in the case. Dr. M'Clintock amputated the uterus, and the patient made a very good recovery. In both of those cases Dr. M'Clintock amputated the uterus. The next case he (Dr. Kidd) saw was one under his own care, that

of a woman who came into the Coombe Hospital, with a completely inverted uterus. He thought it had been inverted for fourteen years, and the patient had suffered a great deal from a hæmorrhagic mucous discharge, and was greatly exhausted by it. He attempted to reduce the tumour in that case, but he adopted the plan of making his efforts at reduction by pressure on the fundus, but he failed completely. That woman left the hospital suffering very much from the attempt at reduction; he was very sorry to say she went out no better than when she came. The next case he saw of complete inversion of the uterus following labour was of about six months' duration. He placed that woman under the influence of chloroform, and introduced his hand into the vagina, but instead of attempting to reduce the tumour by making pressure on the fundus, as in the previous case, he began reduction by pushing up the highest portion of the tumour, the portion that last came through. In the course of some seven or eight minutes he reduced the uterus into its normal position, followed it up with his finger, and the woman made a complete recovery. The next case that came under his observation was one of fibrous polypus growing from the fundus of the uterus, which he saw in St. Vincent's Hospital. An examination of that case made it evident that there was complete inversion of the uterus. In that case it was very plain where the polypus began and where the uterus ended. It was completely inverted. He was not sure that inversion of the uterus was becoming less frequent now they had adopted the expedient of pressing out the placenta. It seemed a very reasonable supposition at first sight that the uterus might be inverted by dragging at the cord, but they certainly had cases on record to prove that it was not always that which was the cause of inversion. Dr. George Johnston had put a case on record where there was inversion of the uterus by irregular contraction of the fibres of the uterus itself, and where there was no traction by the cord. It was quite possible the uterus might be dragged down by drawing the cord, but he was inclined to think that the cord would give way before the uterus would give way.

Dr. DENHAM did not agree with the statement put forth by the writer of the paper, that pressure on the fundus was a common cause of inversion; in fact, the occurrence was so rare that if pressure or traction induced inversion, they would have it much more frequently. The case alluded to as Dr. M'Clintock's, occurred during the first year of his (Dr. Denham's) mastership of the Rotundo Hospital while he was ill, and Dr. M'Clintock was temporarily in charge of that institution. The tumour was very small and inversion seemed to be a voluntary operation, as the tumour could not have dragged down the uterus. The woman made an admirable reeovery. He had another case of recent inversion where a poor woman was attended by a midwife, apparently anxious to anticipate the labours of the physician who was engaged to attend the case, who made powerful traction on the cord, pulled down the placenta and inverted the uterus, but she very adroitly took away the placenta and pushed back the uterus. There was severe hæmorrhage subsequently. The nature of the case was easily diagnosed by them, and after about one or two hours' endeavour to resuscitate the poor woman's strength, which was greatly exhausted, she was put under chloroform, and with considerable difficulty and anxiously slow manipulation, they were enabled to get up almost the entire body of the uterus. Strange to say, a small portion would not yield to any force, and so they left the patient for the night, but on the following morning they found that Nature seemed to have accomplished all that they wished. That woman conceived again, but died, he believed, of puerperal fever in her confinement.

Dr. MACAN, in reply, said he did not say that pressure on the fundus of the uterus was a common cause of inversion of the uterus, but that it sometimes was a cause. That pulling on the cord did cause inversion of the uterus, the history of a large number of cases showed. He simply recognised the possibility of pressure over the fundus causing inversion. His chief object in bringing the case before the Society was to elicit the opinion of some of the older members as to whether they thought the use of the sutures did not entirely prevent any danger of secondary hæmorrhage, and also by bringing the two peritoneal surfaces into close contact, lessen the chance of the operation being followed by general peritonitis.

The Society shortly afterwards adjourned.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 25, 1877.

THE TITLE OF M.D.

IN our issue of July 11 we spoke of the unauthorised use of the title of Doctor of Medicine, and of the misrepresentation which such use involves on the part of universities which profess to confer the Doctorate without the course of academic study in Arts which has hitherto been considered an essential accompaniment of the M.D. degree. We deprecated emphatically the employment of the title by physician-licentiates, not only because it was a pretence but because it was an intentional misrepresentation.

The subject has received a forcible illustration in the Dublin law courts some weeks since in the case of a general practitioner who claimed a larger sum for attendance on a deceased patient than the executors were ready to pay. He demanded 10s. a visit, and produced evidence that a physician's fee was a guinea—the executors tendered him a general practitioner's fee which, they mentioned, was 5s. Thus the question arose as to the professional qualification of the claimant, and it was shown that, though only a licentiate apothecary, he had habitually styled himself "doctor" and attached M.D. to his name in furnishing accounts. There was a verdict against the medical man, and the learned judge in his charge to the jury, said:—

"The conduct he (the plaintiff) had pursued for years in affixing the letters 'M.D.' to his name, when he had no more right to do so than any other person in the community, was deserving of the strongest disapprobation. It was not only a legal offence, but an offence against morality and integrity, and he was sorry to see a man in ——'s position insensible to that fact, and holding himself forth to his customers as a doctor of medicine, when he was no more a doctor of medicine than the patients themselves."

A more emphatic condemnation of the misuse of the title of doctor than this, coming as it did from the highest legal authority, could not be conceived. The newspapers, however, go even further in censure, for we find the following passage in the *Daily Express*:—

"He (the practitioner) made a damaging admission, to the effect that he was not legally authorised to annex 'M.D.' to his name, and only used the letters because he was a general practitioner, which he has been for forty-three years. The plaintiff has been taught a severe lesson, but there is still an important question for the profession and the public. Why should a practitioner be allowed with impunity to violate the law, and deceive the community by the false representation that he is fully qualified by a medical degree? The Act of Parliament imposes penalties for such offences. Of what use is it to the profession, and what protection to the public, if the law is allowed to remain a dead letter?"

We are not disposed to stand upon the strictness of right in such a matter, and would not think the occasional use of the name of "Doctor" to be anything more than a courtesy title but, as we have already said, it seems to us that there is an immediate danger of the profession being deprived of its highest professional distinction, and the licenses of corporate bodies being lowered in estimation in consequence of the facilities afforded to practitioners deficient in education to enrol themselves in the list hitherto occupied only by University Art graduates. A correspondent of a medical contemporary puts the case plainly in the following sentences:—

"Formerly, the degree of M.D. was almost the exclusive mark of the teacher of medicine and the consulting physician, and it was properly kept to its legitimate uses; now it has become a licence for general practice. Swarms of young men holding it are entering into the already too full field of competition, and openly vie with general practitioners in open shops, club, dispensary, and provident work at a price of remuneration which some respectable tradesmen would despise, and even assume, by reason of the possession of these degrees, airs of superiority over their older and riper brethren which neither the practical knowledge nor the standing of these youthful graduates justify. The highest honours which any University can bestow have been placed upon such youthful and inexperienced recipients chiefly and unconditionally because they have resided for two (?) years at some University far remote from the best metropolitan and provincial schools, at a time of life when, as already shown, time can be of little value—eighteen to twenty-one years of age, a period, probably, when such youths would have a great difficulty in earning the wages of a good mechanic, say £100 *per annum*. But for the power possessed in granting these degrees, these Universities would probably be nearly abandoned by students in the severe competition with the better metropolitan and other schools."

THE FOURTH ANNUAL REPORT OF THE LONDON TEMPERANCE HOSPITAL.

A SHORT time back we made a few remarks in reference to this hospital and the system of treatment adopted by its medical staff. Our observations were not prompted by the least prejudice or ill feeling on the subject, but were made purely in the interests of medical science, and of the patients who profit by its advancement. The annual public meeting in connection with the institution had been held with some degree of *éclat*. An eminent dignitary of the Roman Catholic Church, wrote to say that while others only made speeches, the hospital demonstrates that alcohol is neither necessary in health nor in sickness, and that the practice there followed cannot but affect the science and practice of medicine. We were also informed, that in the judgment of the medical staff the fullest benefit possible had been secured to every patient without resort to alcohol, even as a drug in a single case. We ventured to question the truth of these opinions. It was pointed out that the therapeutic value of alcohol in the treatment of disease is a question that cannot be determined so easily as some may imagine, even in a hospital especially adapted for the experiment. It was, moreover, urged that too much reliance must not be placed in the statistics that will doubtless be adduced in favour of the non-alcoholic treatment, that the hospital's reports must be most carefully drawn up, and the clinical evidence be of the most unimpeachable nature, if this method of treatment is to meet with general approval, and that as a matter of fact, such evidence had not been as yet forthcoming.

Since we last wrote on this important subject, we have received the Fourth Annual Report of the hospital, and before going any further we may at once say that, although we have given careful attention to the criticism which our remarks have called forth there is not a single fact mentioned in this Report which could induce us to alter our opinion. From the cases cited in the Report, it may be presumed that the medical staff have sanctioned their publication as some evidence in favour of their system of treatment. If that be the case, more worthless evidence, as respects the question under discussion, could not emanate from a body of scientific men, and we trust that, if the inutility of alcoholic stimulants as a therapeutic agent, be as it may be, a scientific fact, its due recognition will rest upon very different evidence to that adduced in this Report. There can be no doubt that this is a question about which there should be no trifling. The fact, that this question is still an open one is an opprobrium to the profession. Formerly when the great reaction set in against the antiphlogistic treatment of disease, alcoholic stimulants were all the fashion, and were given in quantities that would appal any member of the Temperance League. Now as absurd a reaction seems likely to set in in the opposite direction and the medicinal administration of a small quantity of wine or brandy is to be regarded with as much horror as a modern physician would regard the wholesale bleedings of a Dr. Sangrado. Does, therefore, the report before us give any earnest that this question is to be soon settled once and for ever? And is it, along with "the accumulated experience and tabulated results" of this hospital, such as "to attract the notice of the guides of medical thought." There are 26 cases cited, and the character and brevity of the report may be well illustrated by the following:—

Cephalalgia and Nervous Prostration.—Case No. 349.—E. B., æt. 20, tailoress, non-abstainer, admitted June, 16th, 1876, under the care of Dr. Lee, with nervous prostration, produced by overwork, and intense headache, which was so severe as to render the patient unable to lift her head from the pillow. The appetite was bad, and the sight much impaired. Remained in the Hospital eight weeks, and was then discharged convalescent. Treatment non-alcoholic."

We are not informed what the treatment, either of this

or the other cases, consisted of. We are simply informed that no alcohol was given. Moreover, out of these 26 cases, fully one-half are cases of disease in which the profession are not in the habit of prescribing alcoholic stimulants. Only the most ardent disciple of Todd would think of giving them for such complaints as "rheumatic gout," "rheumatic fever," "acute abscess," "lacrymal fistula," "injured foot," "jaundice," "acute eczema," and "inflammation of the bladder." It is also remarkable that no fatal case is recorded. If there was none to report then the case speaks for itself; and whoever in future gives his patients any wine or brandy is simply guilty of manslaughter. If, on the other hand, some of their cases were fatal, why are they excluded from the report. Was this a mere oversight on the part of the authorities, or do they wish to imply that the cures they have so carefully recorded, were the result of the non-alcoholic treatment. Nor were many of these cures by any means rapid. One case of rheumatic fever was in the hospital from May 6 to July 1st. The case of cephalalgia was under treatment eight weeks. One of dysentery was admitted 24th of August, and was only relieved when he was discharged on November 17th. Take the cases altogether the logic of the report is truly remarkable. A. B. is admitted into hospital, and in the course of a few weeks he gets well and is discharged. No alcoholic stimulants whatever were administered. *Ergo*, alcoholic stimulants are not required in the treatment of disease. This is a syllogism that may satisfy the authorities of the Temperance Hospital, but we doubt whether it will convince those who hold a different opinion. We do not wish to be hypercritical, but we doubt whether, in point of testimony, greater value can be attached to this list of cases than to those voluminous reports of the virtues of certain patent medicines which figure in the columns of the daily papers. Cure No. 56,811 of Holloway's Plils and Ointment, or cure No. 5,862 of Clarke's Patent Blood Mixture, may, as specimens of medical proof, be put on a par with Case No. 349 of the London Temperance Hospital.

It may then be asked on what evidence can we rely if we cannot trust such reports as that which has formed the subject of the foregoing remarks, coupled with the conscientious observations and opinions of the medical staff of the hospital? It is incumbent upon us to answer this question, and we shall take the earliest opportunity of doing so.

THE SALE OF FOOD AND DRUGS ACT IN IRELAND.

ALTHOUGH the law for the suppression of the sale of adulterated food and drugs has been in existence for more than two years, it has not yet been put in action in any of the rural parts of Ireland, and the first effort of a board of guardians in this direction has, within the last few weeks, given rise to a somewhat amusing controversy between the sanitary authority and the Irish Local Government Board, and to a dilemma from which neither party seems capable of extricating itself.

We must premise that the Act ("Irish Med. Directory," page 524) contains a clause (No. 13) which orders that:—

"Any *medical officer of health*, inspector of nuisances, or inspector of weights and measures, or any inspector of a market, or any police constable under the direction and at the cost of the local authority appointing such officer, inspector, or constable, or charged with the execution of this Act, may procure any sample of food or drugs, and if he suspect the same to have been sold to him contrary to any provision of this Act, shall submit the same to be analysed by the analyst of the district or place for which he acts, &c., &c."

Now it happens that there was previous to this enactment no medical officer of health in the rural districts of Ireland; nay more! the Local Government Board had refused to allow the dispensary medical officer to be so designated in the Public Health Act, possibly lest he might not be placed in a sufficiently subordinate position. Being thus called upon to put the Sale of Food and Drugs Act in operation, the Local Government Board, in its characteristic style, simply shifted the difficulty on to the Boards of Guardians, and left things otherwise as they were. This they did by sending simply the clause of the Act, leaving the guardians to interpret it as they liked, and to act upon or neglect it as they pleased. Thus matters stood for a year, at the end of which time the Local Government Board, being subjected to continuous cross-questioning by the sanitary authorities, informed them by circular that "acting on an opinion given by the law adviser, they recommend the sanitary authority to adopt the suggestion that the sanitary officers and sub-sanitary officers should be formally nominated to be the medical officers of health and inspector of nuisances within the Act."

It will be observed that by this recommendation the guardians were requested to appoint a medical officer of health, though the Act nowhere gave them any such power, and though it contained no clause to compel the sanitary officer to act, if appointed, nor any authority to the board to pay him out of the rates. These were palpable difficulties, and accordingly the Donaghmore guardians, like Oliver Twist, wanted more advice. The following is the answer they received:—

[COPY.]
Local Government Board, Dublin.
7th June, 1877.

SIR,—the Local Government Board for Ireland have had before them the resolution of the Board of Guardians of Donaghmore Union of the 18th ultimo, referring to the Board's letter of the previous day, relating to the refusal of the medical officer of the Rathdowney Dispensary District to act as medical officer of health under the Sale of Food and Drugs Act, and inquiring if under Dr. Smyth's appointment as sanitary officer it is his duty to carry out the provisions of the Act referred to in his district.

In reply the Local Government Board desire to state that they have no precedents applicable to the case except the opinion of a recent law adviser that the term "medical officer of health" must be taken to include the sanitary officer of the district in which the occasion for proceeding may arise.

By order of the Board,
W. D. WODSWORTH, Assistant Secretary.

To the Clerk, Donaghmore Union.

From this reply it appeared that, according to the law adviser's view, the sanitary officer was *ipso facto* medical officer of health, and, therefore, liable to the execution of the Sale of Food and Drugs Act, as a matter of duty, and whether paid or not. From this view the sanitary officers

and notably, Dr. Smyth of Donaghmore, vehemently dissented, and the board of guardians having again, by the following resolution, asked for instructions, received the following reply from the Local Government Board:

"That the board regret that the Local Government Board has not replied decidedly to the questions put to them.—'Is Dr. Smyth the party to discharge the duties named in the Sale of Food and Drugs Act in his dispensary district?' And if so, under what conditions are we to call upon him to act, and the board request that they may now be favoured with a *definite* answer on the subject. The Act we look upon as important, and the duties in it onerous."

[Reply.]

"Local Government Board, Dublin,
June 27th, 1877.

"Sir,—The Local Government Board for Ireland have had before them minutes of proceedings of the board of guardians of Donaghmore union on the 15th inst., containing an entry of their letter of the 7th inst., relative to the inquiries made by the guardians as to the duty and responsibility of the sanitary officer (Dr. Smyth) under the provisions of the Sale of Food and Drugs Act; and in reply to the minute thereof, the Board desire to observe that, as they have stated in their circular of the 13th November, 1875, in their opinion the words 'Medical Officer of Health,' and the words 'Inspector of Nuisances,' as used in the 13th section of the Sale of Food and Drugs Act, include the sanitary officers and sub-sanitary officers under the Public Health Act, 1874, and this view was subsequently concurred in by the law adviser of the Lord-Lieutenant.

"The section does not enjoin the performance of any special duties by these officers, but it merely empowers them (under the direction and at the cost of the local authority appointing them) to procure samples of food and drugs, and to submit them for analysis; and the power which these officers have in this respect beyond that of other persons, appears to consist in the fact that any person refusing to sell to them any article which is on sale by retail on the premises exposes himself to a penalty by such refusal.

"With reference to the questions of the board of guardians, as to which of the officers should be charged with the execution of the Act in this respect; whether Dr. Smyth is the party; and, if so, on what conditions he is to be called upon to act; the Board can only say that these are matters of arrangement to be made by the board of guardians at their discretion.

"The dispensary medical officer, as the sanitary officer, is invested with the powers given by the Act, and should therefore receive such general directions as will authorise him to exercise those powers in any case in which it may be desirable that he should do so; but if the guardians contemplate a systematic and general proceeding for the detection of cases in which articles are sold contrary to the provisions of the Act, it would appear to be unreasonable to impose such a duty upon the medical officer, which could, no doubt, be more suitably entrusted to the sub-sanitary officer, under the direction of the sanitary authority, or to one of the other officers named in the section under the directions of the local authority appointing them.

"By order of the Board,
"B. Banks, Secretary."

This letter is a remarkable document. It says "the Act does not enjoin the performance of any special duties on the medical officers." Nevertheless it empowers them, under the direction of the sanitary authority, to perform certain very definite, and somewhat ignominious functions. These functions, if performed "under the direction" of the guardians, are, it strikes us, a duty; but as to all the other questions the Local Government Board could give no better information than that they "are matters of arrangement." Finally, the Local Government Board informs the Irish sanitary authorities that "the dispensary medical officer" is the person invested with the powers given by the Act, yet it suggests to the guardians to appoint another officer to do the work without saying how he is to be paid.

We are, we confess, in no better case than the guardians, and utterly break down in the effort to understand what the Irish Local Government Board means. To elucidate this obscure point, the Council of the Irish Medical Association has also been at work, with no happier result. We give the correspondence between the Hon. Sec. of the Council and the Local Government Board as it stands:—

2nd July, 1877.

Sir,—I am instructed by the Council of the Irish Medical Association to ask you upon what authority the medical sanitary officers of Ireland are charged with the duties of the "medical officers of health" under the Food and Drugs Act, and also whether any, and if so what, provision has been or is to be made to remunerate medical sanitary officers for these extra duties?

I have the honour to be, Sir,
Your obedient servant,
Signed, J. W. Moore,
Hon. Sec. to Council.

To B. Banks, Esq., Sec. Local Government Board.

Local Government Board, Dublin,
3rd July 1877.

Sir,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 2nd inst., inquiring upon what authority the medical sanitary officers of Ireland are charged with the duties of the medical officers of health under the Food and Drugs Act and in reference thereto the Board forward for your information a copy of a circular letter which they addressed to the several sanitary authorities on the subject on the 28th April, 1876.

By order of the Board,
B. Banks, Secretary.

To J. W. Moore, Esq.,
Honorary Secretary, Irish Medical Association.

14th July, 1877.

Sir,—I have the honour to acknowledge the receipt of your letter dated 3rd July, 1877, and am directed by the Council of the Irish Medical Association to inquire whether it is compulsory on the dispensary medical officers of Ireland to accept office under the Sale of Food and Drugs Act, 1875. Further (in reference to a query in my last letter, to which no answer was made in your reply), I am directed to ask what provision has been, or is to be made, to remunerate the dispensary medical officers for their duties under the same Act.

I have the honour, &c.
J. W. Moore,
Hon. Sec. to Council.

Local Government Board,
Dublin, 18th July, 1877.

Sir,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 14th inst., inquiring, by direction of the Council of the Irish Medical Association, whether it is compulsory on the dispensary medical officers of Ireland to accept office under the Sale of Food and Drugs Act, 1875, and what provision has been made, or is to be made, to remunerate them for their duties under the same Act; and in reply, the Board desire to state that they are not prepared at present to express any opinion on the question of the liability of sanitary officers to discharge duties under the Food and Drugs Act, further than that already stated in their circular letter of the 3rd November, 1875, and concurred in by a former law adviser of the Lord-Lieutenant—namely, that the words "medical officer of health" include the sanitary officers under the Public Health Act of 1874.

The general view which the Board take of the matter is expressed in a letter which the Board recently addressed to the board of guardians of Donaghmore Union, a copy of which is enclosed for your information.

By order of the Board,
W. D. WODSWORTH, Assistant Secretary.

To J. W. Moore, Esq., M.D., &c., &c.

(*Here follows the letter quoted above.*)

July 19th, 1877.

SIR,—I have the honour to acknowledge the receipt of your letter dated 18th July, 1877, and am desired by the Council of the Irish Medical Association to express their regret that they have failed to elicit the information required, in connection with the Sale of Food and Drugs Act, 1875.

I have, sir, the honour to be,
Your obedient servant,
J. W. MOORE,
Hon. Sec. to Council.

Notes on Current Topics.

Mr. Forster on Vivisection.

THE Right Hon. Mr. Forster, M.P., one of the most able members of the last liberal Cabinet, made a very excellent and appropriate speech at the distribution of prizes at the London Hospital last week. The principal topic touched upon was vivisection, in which he brought forward both facts and arguments which the fanatical opponents of scientific research would do well to carefully weigh. The right hon. gentleman was both just and generous in his estimate of the motives which occupied the medical profession in the matter, when he confessed to a good deal of sympathy with the physiologists. There had been, he said, gross exaggerations with regard to these vivisection experiments. The commission discovered in the course of their investigations that the statements as to the reckless cruelty in the practice of vivisection in England were almost absolutely unfounded. There had, he thought, been a misconstruction or misapprehension of the motives of the medical profession in that respect; and he felt that some of the persons who had made the severest attacks upon vivisection had not themselves the cleanest hands. He did not want to draw any comparison between medical science and sport, as to which killed most or which was most open to the charge of cruelty. He was indifferent as to that question, because, from ignorance, he was incapable of performing any scientific experiment, and because, on the other hand, he was not a sportsman. The reason why he had not been a sportsman was because he did not fancy what seemed the almost necessary cruelty connected with that sport. But he could well understand how people should desire, as far as possible, to lessen suffering, and he believed that physiologists had, with that view, shown an earnest desire for the passing of the Cruelty to Animals Act. He believed that the medical profession desired to avoid all experiments in the way of vivisection which could cause any unnecessary pain, and that instances of cruelty in that respect were almost unknown, while under the Act in question such experiments were only allowed to be made when the animals operated on were under the influence of anæsthetics, no experiments being permitted now under any circumstances for the mere purpose of teaching. Although the general feeling of the medical profession was such as he had already indicated, it was necessary to have certain safeguards, and he did not think that in this legislation Parliament had gone beyond the feeling of the medical profession itself.

In making this statement, Mr. Forster echoes the views of the Under Secretary of the present Government, Sir H. Selwin Ibbetson, who, only a few weeks since, stated in the House of Commons that "there had been no disposition whatever on the part of teachers of physiology to disregard the Act; on the contrary, it had been most frankly accepted by them both in its spirit and in its meaning." That this is so no one can for a moment doubt; notwithstanding the truth of this assertion the Home Secretary, Mr. Cross, has, upon his own responsibility, and without any reasonable grounds, refused to grant personal licences to more than one eminent teacher of physiology. If he continues to administer the Act in this partial and one-sided spirit both teachers and students will be driven to pursue physiology on the Continent, where no arbitrary and factious restrictions are imposed, and no restraints are placed upon the pursuit of scientific medicine. The law, as it stands, does all that humanity can fairly demand, to do more would be wilfully to debar us from the means of gaining medical knowledge from which the most valuable results have been gained in the past, and from which it is only reasonable to hope as much in the future.

The Law of Counter-Prescribing.

THE Medical Defence Association has, we are pleased to observe, achieved an unmistakeable victory in the Birmingham county court, in a prosecution against a druggist named Harrison for counter-prescribing. The case was defended with all the energies of the Chemists' Defence Association, and terminated with an unequivocal decision of the judge that the prescribing was illegal, he refraining from granting a decree only because he desired to await an appeal (now pending) to the higher court in another analogous case. The gist of the argument may be taken from the following passages:—

His Honour: Do you mean to say any person may go to a chemist and say, "I am suffering from some disease or other, but I don't know what it is; I have not been well for a month and am getting worse," and the chemist prescribe for him?

Mr. Herbert (counsel for defendant): In simple minor ailments.

His Honour: You admit no chemist can attend at a patient's house and supply medicine?

Mr. Herbert: Yes.

His Honour said, in his opinion a man might go to a chemist and say, "I have got a toothache, or I have got a headache, will you give me, say, some sal volatile for the headache and some tincture for the tooth." His Honour had not the slightest doubt that a chemist might sell what was required, but whether he might take the ordinary means of finding out the headache or toothache, and then prescribe medicines for the disease which he himself had found out, was quite another matter. He ventured to put it that if a man went to a chemist's shop and said he was suffering from some disease, the nature of which he did not know, and the chemist took the ordinary means of feeling his pulse and examining him, and then saying, "I know what's the matter with you," and supplied him with some medicine, he would be infringing the Act.

Mr. Herbert: I might consult with one of my friends and say, "I think a little quinine would do you good." If I may say that, why may not a chemist say it?

His Honour: You have no interest in the sale of the quinine. You may, as a friend, offer advice; but gratuitous advice is seldom worth receiving.

The learned counsel contended that the defendant had in no way infringed the Act and the statement of the woman. The chemist had a right to consult with his customer, and supply what was best for her. Surely the defendant might suggest to her, persuade her to take (in the sense of buying) or dissuade her from buying; such consultation was part of the sale.

His Honour: That is contrary to the opinion of Baron Bramwell. His lordship stated that if a person entered a chemist's shop and asked for something to cure the headache, and the chemist gave him some medicine, he would be technically infringing the terms of the Act, although it would be very unreasonable for the Society to interfere in such a case. I am not prepared, however, to adopt in its entirety the view of the learned Baron. I draw the line, and say, if a person goes to a chemist, suffering under a disease the nature of which he does not know, but believes the chemist does, and he takes the ordinary means of ascertaining what that disease is, and then prescribes medicine to cure the disease, which by examination in any way you like is found out, then he steps beyond his province as a chemist, and adopts that of a medical man. What authority is there for saying that the chemist might prescribe for minor ailments, and where would you draw the line?

Mr. Herbert: By exercising discretion, as we did prior to 1815.

His Honour: The section to which reference has been made provides against the trade of a chemist in buying, preparing, compounding, dispensing, and vending medicines; nothing is said about prescribing. It appears a very good Act, and ought not to be infringed.

Mr. Nathan, for the prosecution, remarked that as long as chemists confined themselves to the buying, preparing, compounding, dispensing, and vending of drugs, they would not be open to any interference.

Deaths from Hydrophobia.

Deaths from hydrophobia have been pretty frequent of late, but it is rather a sad reflection that all the outcome of our recent experience of this disease are the brief and conventional records that appear in the daily papers. For instance, the other day the coroner for the City received information of the death of a young man named James Keith, a railway clerk, of Downs Park Road, Dalston, who died of hydrophobia in its most malignant form. It appears that the deceased was walking along the Westminster Bridge Road about three months ago, when a dog in a rabid condition bit his hand. The man went at once to St. Thomas's Hospital, where the wound was cauterised and other preventive measures taken. The wound never healed properly, and a few days since symptoms of hydrophobia made their appearance. He grew worse every hour, and died soon after in a raving condition.

Such is the stereotyped account we generally have of these cases. No doubt a case occasionally occurs at a hospital, when all the circumstances attendant upon it are more closely examined and fully recorded. But even then the clinical record is soon lost and forgotten among the host of hospital reports among which it is buried, besides which the report itself is chiefly confined to a narration of the symptoms which are pretty well known, and of the treatment, which is never successful.

Now it is generally admitted that of all the persons who are bitten by mad dogs, only a certain number are attacked with this dreadful disease. Seeing, therefore, that there is so little to be hoped for from the treatment of hydrophobia, we should be all the more anxious to gain all the information we can respecting the conditions under which it is developed, and the means by which it may be prevented. To this end, the strictest investigation should be made into every well-authentica ted case. All the circumstances under which the patient was bitten, whether in the naked flesh or through articles of clothing, whether the person was the first or last bitten by the rabid animal, the nature of the precautions taken after the bite and the promptitude with which they were adopted, the constitution and habits and general health of the person attacked; all these and other questions should be carefully inquired into, so that in time we might get a large accumulation of facts bearing upon the natural history of the disease, which might in time cast a flood of light upon the prognosis and prevention of the disease.

On Her Majesty's Staff.

Our attention is drawn to the medical staff of her Majesty the Queen as originally constituted, by the announcement in last week's official *Gazette*, of the appointment of Messrs. Peter and Alfred Squire as chemists and druggists upon the establishment, vice Mr. Peter Squire, senior, resigned. This announcement, whilst it recalls to our memory the appointment of Mr. Squire as far back as August, 1837, and the fact that he is now the sole survivor of the first medical staff then constituted, reminds us also of his services to the profession, services which will live in the memory for generations after the giver of them shall have ceased to exist. Long may this latter be deferred, for we heartily wish Mr. Squire in his retirement many more years of that material and intellectual health which he has in the past enjoyed. Indeed, he may be quoted as a bright example of that class of men who seem to thrive upon hard mental labour, an evergreen to the last. Previous to his appointment on the staff in 1837, Mr. Squire was officially connected with the court, when her Majesty was Princess Victoria. We believe he is also the sole survivor of the first Council of the Pharmaceutical Society of Great Britain. His connection with the medical profession, however, will be most widely known and remembered for his "Companion to the British Pharmacopœia," a work which has attained to such classic prominence, as to be quoted as *the authority* and guide on the subjects of which it treats.

It is reserved for few medical books, we know of none, to attain to a sale of about thirty thousand volumes in less than twenty years, and its popularity to be continually on the increase. When we say that the profession owe a debt of gratitude to the author of "Squire's Companion," we feel that we are but echoing the sentiments of the whole profession. Further, we think that the valuable services he has rendered to the medical and pharmaceutical bodies, both by his literary and chemical labours, should meet with some fitting acknowledgment in the shape of a scholarship in chemistry at one of our leading schools.

Posthumous honours are very well in their way, but we would prefer that men should see some tangible acknowledgment of their services before the interposition of angels.

The Malthusian League.

THE prosecution caused by the publication of "The Fruits of Philosophy" has had the effect of directing attention to those wholesome laws which protect the morals of the public, as well as those which regulate the increase of population, and has resulted in the formation of a society to be called "The Malthusian League," the objects of which are thus briefly stated :—

"To spread among the people—by lectures, cheap books, leaflets, and by all practicable means—a knowledge of the law of population, and of its practical application.

"To agitate for the abolition of all penalties on the public discussion of the population question.

"To obtain such a statutory definition as shall render it impossible in the future to bring within the scope of the common law, as a misdemeanour, the publication of work dealing with this question."

A knowledge of the laws which govern the labour market, and the practical use to be made of that knowledge is of great importance, especially to the professional man, who is more seriously affected by the laws of political economy than even the labouring classes; but to conceive that any statutory definition could be obtained which would render it impossible to prosecute as a misdemeanant any persons publishing a work professedly treating on the subject of the limitation of population appears so illusory, that one can scarcely believe it possible for half a dozen persons to be found seriously to discuss it. It should be evident to the most enthusiastic Malthusian that such an Act would open the door to the dissemination of the most obscene literature, which, under the guise of philosophy or scientific discussion, would enunciate with impunity the grossest immorality.

We are not acquainted with the names of the prime movers in this direction, but whoever they may be, in giving them credit for the best intentions we would advise them not to add to the many stones with which a certain place is said to be paved, and to pause and seriously consider whether the remedy would not be worse than the disease; even if the disease exist, which has first to be proved; and whether in publishing what they conceive to be physiological truths they may not do more mischief by disclosing to the youth of both sexes matters which they have not any business to be acquainted with, and enable them to indulge prematurely those passions which, given for the highest and most important purposes, may be productive of the most serious injury to their constitutions and morals.

Cardinal Manning on Drink.

THE letter which Cardinal Manning recently addressed to a gentleman at Dublin, who wished to know his opinion on the effects of wine on the upper and middle classes, is one in the general spirit of which the whole profession will join. No one knows better than the medical man that there is a great deal of intemperance which never betrays itself in drunkenness, and that from various motives men and women keep within the line beyond which they would be detected. The medical profession has indeed done much to expose the habit of secret drinking, and have suggested means by which this evil may be more or less successfully treated. The Cardinal thinks the best method of dealing with it is to bring up children in simple habits, and to guard them against acquiring a liking for intoxicating drinks. Train up children not to know the taste and they will not be tempted. "If (says he) the fathers and mothers of to-day had been so trained, we should not now have before us so many unhappy homes and cast-out children."

We do not, however, think that much of the intemperance that now exists can be traced to the cause abovementioned. We generally find that girls have a particular aversion to wine and other strong drinks, and that even the habit which some of the poorer classes have of giving gin and other stimulants to their children, is more likely to sicken them of the habit than of engendering it. On the other hand, those who have fallen into intemperate habits have often been remarkably abstemious in their youth, and they have dated their craving for drink from the time when they were ordered wine or brandy by their medical attendant, or have attributed it to the temptation afforded by the mental and bodily prostation under which they may have been labouring, or to the great relief they seemed to find from the use of stimulants in times of great anxiety and trouble.

Prevention of Small-Pox.

A FEW days ago Mr. Sclater-Booth stated in the House that most of the vestries had provided extraordinary accommodation for the treatment of patients, and some of them were engaged in a house-to-house visitation to see that the people were properly vaccinated. Care would be taken that the experience of the last nine months should be properly collected.

This information is very important, and augurs well for the steps that will be taken in future to prevent the outbreak and spread of small-pox. Undoubtedly it would be a great opprobrium to sanitary science if we allowed such another epidemic to rage amongst us as that which has prevailed within the last twelve months. Nothing, however, could prevent such a calamity occurring again short of the universal practice of vaccination, the effectual performance of the operation, and the practice of *re-vaccination*. Now, as periodical house-to-house visitation would be very successful in securing the due performance of infantile vaccination (which is now too frequently done in a very perfunctory manner) it would be as well if this system were adopted by not only "some," but by all the vestries in this metropolis. Such periodical visitations could not be regarded by the public as any intrusion upon their privacy, as only one visit would be necessary within the first twelve months of every child born. But not even would this system be successful in stamping out the disease unless the practice of re-vaccination is more generally adopted than it is at present, and therefore it is to be hoped that some steps will be taken to encourage this practice. The more general adoption of re-vaccination cannot now be so well promoted by legislative interference as by the action taken by the profession. It is the general practitioner who should impress upon parents the necessity of having their children, and even themselves, re-vaccinated

and therefore we shall be very much wanting in our duty to the State and to the public if we do not do all that lies in our power to prevent the occurrence of another such epidemic as that through which we are now passing.

The Fruits of Philosophy.

It is stated in the papers that Mrs. Besant has been delivering an address at the Hall of Science in which she maintained that the course she and Mr. Bradlaugh had pursued was the right one, and that it was owing to the existence of bad laws that so much evil was brought about. In past times reforms had been the result of a defiance of bad laws. Mr. Bradlaugh and herself were prepared to go to prison, but as soon as their sentence expired they would most certainly again publish the pamphlet which had been condemned, no matter what the consequences might be.

It is evident, therefore, we need not have been so astonished as we were to find that Mrs. Besant was bold enough to appear in a court of justice in defence of this notorious publication. A woman who could publicly defend a pamphlet the title and contents of which might almost be compared with those that used to be seen in the windows of the shops of Holywell Street, and who says she will, regardless of consequences, persist in publishing it, is beneath the consideration of those who have any respect for womankind. We have no objection to see people have the courage of their convictions, but some bounds must be set to the liberty of those whose actions threaten to demoralise society. The passions of women are, when aroused, often more formidable than those of men, and therefore it is possible that this determined and infatuated lady may venture to tread where even Mr. Bradlaugh would "fear to creep." We trust, however, that the strong arm of the law will thwart her beneficent intentions, and that we shall soon hear no more of a pamphlet which is like a rotten leaf, and we fear there are many of them amid the extensive and alluring foliage of modern civilisation.

The Consolidation of Provident Dispensaries.

We understand that a meeting will be held on Saturday next in the rooms of the Medical Society of London, for the purpose of strengthening and consolidating the movement in favour of provident dispensaries and paying hospitals throughout the metropolis. The idea is set on foot by the Charity Organisation Society, which invites the attendance of medical men at the meeting. Mr. Timothy Holmes, F.R.C.S., has promised to take the chair, and Dr. Ford Anderson will read a short paper to open the discussion, of which the following will be the principal points :—

1. What steps should be taken to increase the number of efficient provident dispensaries in London ?

2. What should be the relations of the provident dispensaries to the hospitals ?

3. Is it possible to secure a correspondence between the different provident dispensaries in London, so that a member of a provident dispensary, when he removes to another district, can, without delay and without entrance fee, immediately obtain medical relief in the provident dispensary nearest his new residence ?

Impure Water.

According to Dr. Frankland's report the water supplied by the Southwark and Vauxhall Company is "full of moving organisms, and contains an excessive proportion of organic impurity," and it would appear that the water has been in an unsatisfactory condition for some time past. This announcement is quite enough to make every inhabitant of Southwark and Vauxhall a confirmed hydrophobist, especially at this season of the year ; and as we are forbidden to drink wine and spirits, and cannot be always sipping tea and coffee it is to be hoped that the above Company will soon put their house in order. As many thousands must have been for a long time drinking this water it would be worth while knowing from the medical officers of these districts the influence, if any, that such a state of things may have had upon the health of the inhabitants. Probably they are in a great measure protected from the consequences that might otherwise result from the impurity of their water supply, by the now universal practice of drinking tea and coffee, in the preparation of which these "moving organisms" are effectually destroyed.

Social Science Congress.

The following are the special questions selected for discussion in the Health Department at the forthcoming Congress at Aberdeen :—

1. What is the best mode of providing suitable accommodation for the labouring classes, and of utilising open spaces in towns ?

2. How can the sanitary condition of the population engaged in the coast fisheries of Scotland and the United Kingdom be improved ?

3. The present state of house accommodation in rural districts. Can its evils be remedied ?

Papers volunteered on other subjects coming within the scope of the department will be read and discussed.

Adulterated Sweet Spirit of Nitre.

Three parties were recently prosecuted at the Bradford Borough Court for the sale of diluted sweet spirit of nitre. The defendants were a grocer, an herbalist, and a chemist. The three samples tested contained respectively 26 per cent., 27 per cent., and 20 per cent. of water more than the standard. They were almost tasteless, and gave but very faint indications of the presence of nitrous ether. For the chemist it was argued that a weaker spirit of nitre than the standard was a regular article of sale. This had been sold at 2½d. per ounce, at which price the standard article could not be obtained. The magistrates imposed a fine in each case of £1 and £3 10s. costs.

The Society of Arts, which bestows annually the "Albert Gold Medal" "for distinguished merit in promoting arts, manufactures of commerce," has this year selected as the most deserving recipient "Jean Baptiste Dumas, member of the Institute of France, the distinguished chemist, whose researches have exercised a very natural influence on the advancement of the industrial Arts."

The Manchester and Salford Sanitary Association will hold an exhibition of sanitary appliances at Manchester during the second and third weeks in August. It will be

open to the public at a small charge, and is to include the usual class of exhibits. The meeting of the British Medical Association at the same place and time will add to the success of the exhibition.

THE first step towards the general utilisation of the electric light has been at last taken. A Russian has invented a form of burner in which the carbons are parallel, and are only insulated by a layer of asbestos or vitrified kaolin. The invention has been tried at the West India Docks and other places, and with such marked success that on the first report gas companies' securities fell, in some cases as much as 16 per cent. within a week. The new candle is said to give a light equal to 100 gas burners.

THERE was a slight increase of deaths from small-pox in London last week. Fifteen occurred in small-pox hospitals and 17 in private houses. The deaths referred to other fevers continue much below the average throughout the kingdom. With the fruit season and hot weather, diarrhœa is increasing, but not beyond what is usual at this time of year.

THE mortality last week in the four principal cities of the United Kingdom was 19 in Glasgow, 21 in London, 21 in Edinburgh, and 24 in Dublin, per 1,000 of the population. Of the large towns in the second category, Plymouth was lowest with 12, and Salford highest with 28 per 1,000 of the population.

A PARISIAN pharmaceutist received the following homœopathic prescription to be dispensed:—

Lact. mammel. virgin. (milk from a virgin's breast)	30 c. c.
Aq. stil. (aqua dest).	150 c. c.
Alc. (alcohol)	q. s.

F. S. A. Dr. T.

A SAD case of small-pox infection is reported at Helensburgh. A mother and four children, who had taken lodgings there, were supplied with blankets which had covered small-pox patients. All of them took the disease, and the mother and one daughter have since died.

AT the last meeting of the Council of the Royal College of Surgeons of London, Mr. John Birkett, F.R.C.S., was elected President of the College, and Mr. John Simon, C.B., F.R.S.., and Mr. Luther Holden, F.R.C.S., Vice-Presidents, for the ensuing year.

THE thirty-second Annual General Meeting of the Medico-Psychological Association, will be held at the Royal College of Physicians, London, on Thursday, August 2nd, at 11 A.M., under the presidency of G. Fielding Bland, M.D., F.R.C.P.

DR. LE MOYNE, the cremationist, to make sure that all his children shall follow his example and be cremated, has made a will providing that his heirs shall, before receiving their legacies, make a formal promise to be burned after death.

Correspondence.

INTERNATIONAL CONGRESS OF MEDICAL SCIENCE.

MONSIEUR LE REDACTEUR DU MEDICAL PRESS AND CIRCULAR.

MONSIEUR,—Dans votre journal du 18th Juillet, 1877, vous donnez l'extrait des programmes du Congrès des Sciences Médicales. J'ai l'honneur de vous en remercier de la part du comité d'organisation.

Vous faites la remarque que ces programmes auraient dû être imprimés en Anglais. Je dois vous faire observer que le comité n'a aucune raison de publier en Anglais plus qu'en toute autre langue: si nous avons dû donnez la traduction Allemande, c'est pour répondre aux vouz des médecines de la Suisse Allemande. Car le congrès est tenu Génève par la Suisse dont les ⅔ environ de la population parle la langue Allemande.

Comme vous, j'espère que d'autres notabilités de l'Angleterre et de l'Amérique viendront ajouter leur nom à coté de celui du Dr. Broadbent. L'Amerique (par l'intermediare de l'association médicale) nous à annoncé les noms de MM, Marion Sims, Drysdale, et Seguin, qui nous promet une communication.

Agrez, Monsieur, l'assurance de mes sentiments très distingués.

J. L. PREVOST,
Secrétaire Général.

Geneva.

OVER-POPULATION AND IMMORALITY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have read with some little disappointment your observations upon the Bradlaugh-Besant prosecution, because it seemed to me that the tendency of your remarks was to "bless with faint condemnation" the abominable proceedings of the prisoners, and to recognise these persons as well-intentioned, if mistaken, heroes, just as we are asked to regard the Fenian convicts now within the grip of the law. It seems to me that neither Bradlaugh nor Besant are anything better than fanatics, who think to make their fanaticism pay, and who, in order that it may do so, trample without scruple on every principle of morality, every sentiment of decency, every good influence with the public, and every law for the control of debauchery. They are no more heroes than the anti-vaccinators, who display their readiness to suffer for an idea which they will not take the trouble to learn about or reason upon; and they are enemies to society, because they seek notoriety, martyrdom, and money by deliberately sacrificing the morals of the public.

Whether they be heroes or felons, it cannot be doubted that they are disseminators of debauchery, and it seems to me that you have treated the question too much as a scientific controversy, and have hardly fully recognised its moral aspects. Without losing sight of the fact that it is your function to deal with the physiological relations of such questions, I think that in this instance the morality of the matter is overwhelmingly its important side. I consider that, even if Bradlaugh and Besant could prove that over-population is the direct cause of poverty and its attendant evils, the remedy which they propose would entail a state of society far worse than the worst which we might apprehend from a decrease of monetary prosperity.

If I believed their arguments—which I don't—I would still infinitely prefer hard work and low wages to indiscriminate fornication, universal unchastity, and all the delights of a free-love state of society, and I assert that such a state of society would be the inevitable and immediate result of removing all the inducements to continence, as the "checks to population" would do; and I further say that the material prosperity of the community would be far more effectually and certainly destroyed by universal prostitution and unlimited illegitimacy than by starvation, dirt, strikes, and all the other concomitants of poverty.

But, fortunately, it is not necessary to choose between these evils, for, as far as I can see, the Bradlaugh-Besant fraternity have ignominiously failed to show that over-population has anything whatever to say to poverty amongst British subjects. There is, I firmly believe, no over-population in our kingdoms, and I say so because I think that a

country is never over-populated as long as the average man, with average brains, industry, and education is able to earn a sufficiency to maintain himself and his family in perfect health, and to make an advance in his position as his age goes on.

It will not, I imagine, be said that the average man has any difficulty in achieving this in the United Kingdom, and if he had, there still remains for him an ample field for his labour in the colonies. Bradlaugh and Besant could never, I think, justify their theories until they could show that there were too many beings in the world to exist in health and comfort.

For these reasons, I cannot listen to, and appear to concur in, even half-tolerance of the acts or motives of these persons. They are, in my opinion, mere traders upon the pruriency and the mistaken sympathy of the public; fanatics who make their game to win by martyrdom, no matter who may lose; and pests who ought to be crushed out of existence under the heel of public disapprobation, and by the strong arm of firmly-administered law.

I am, sir, yours, &c.,

A Surgeon with a Large Family.

PRIVATE LUNATIC ASYLUMS AND PRIVATE PATIENTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—When I ventured to express my views on this subject, and when you honoured me by inserting them in your journal, I did not expect to enter into a personal controversy with any one disagreeing with my opinions, and as I was dealing with principles, not men, I thought my name would not add a particle of weight to my statements, and I left them to be measured, not by the supposed fame of the writers, but by their own intrinsic merits, if they possess any.

I remembered the old quotation,

"Amicus Plato, amicus Socrates,
Magis amica veritas."

I would be the last to write anonymously on any subject affecting the private character of any individual, however humble; and I look upon the use of a pseudonym as simply a substitute for the *we* used in writing leaders, magazine articles, &c.; and as long as I was dealing with general principles and men as entities. I felt quite justified in the adoption of a *non de plume*. But now that a foeman worthy of any one's steel has entered into the arena, and the controversy is assuming somewhat of a character personal to myself as an individual, by the desire of Dr. Winslow for *me* "to come forward in *my* true light, and so enable him to see whether *my* statements are entitled to the weight to which *I* would, no doubt, lay claim" (as if any name could lend a value to the bolstering up of a fallacy, a falsehood, or a misstatement), personal to Dr. Robertson, by the questions put to me for solution, and personal and strong against the statement made in the *Lancet*, and quoted by me.

I have, using the words attributed to a distinguished living English statesman, only three courses open to me.

1st. To abandon the controversy.

2nd. To sign my name and make the subject personal.

3rd. To remove it back to the higher ground of principle, and to confine myself to the actual terms of the question from which at present we seem inclined to wander, and to state my proposition *de novo*, and to show how the matter may be argued without the intervention of personal asssistance of any kind.

My position and propositions are, I think, with all respect, misunderstood by Dr. Winslow, and hence it is clearly necessary, before occupying your valuable space, that the premises should be clear, else we might argue for ever in a circle of error. If this condition is acceptable, I shall be glad to contribute my aid to the clearing up of the points involved.

I may say they are not to be met by the *ipse dixit* of any man, nor by laudation of commissioners, however much deserved, nor by forcible expressions against opponents, but by calm, dispassionate writing, by the stern logic of facts, which will satisfy not only your readers, but

Yours faithfully,

Scarborough, July 21st, 1877. Humanitarian.

This correspondence must now close.—Ed. M. P. & C.

"THE NON-ALCOHOLIC TREATMENT OF DISEASE."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—If your correspondent, Dr. T. W. Grimshaw, had read my letter in the light of your leading article of June 6th, on which I was commenting, it would have saved him from some misconceptions.

In that article the question is asked, "Will they receive cases of typhoid fever, diphtheria, &c.?" To which I replied to the effect that they not only did so, but cured them in a satisfactory manner.

But Dr. Grimshaw inquires if I do not know "that numbers of cases of typhoid are, and always have been, treated without alcohol?" And he further states that, in his opinion, there are a great many more cases of enteric fever treated without the use of alcohol than with it, by the hospital physicians of the United Kingdom.

Dr. Grimshaw does not appear to perceive that, in making this statement, he is far more at issue with you than with me, as I have simply referred to the fact of such cases having been successfully treated without alcohol, in reply to the first query.

As for my own opinion; I am far from being a "fanatical teetotaller," as I not only use alcoholic liquors myself, but have recently prescribed them (as I believe with very great advantage) in two cases of typhoid fever, one of which was very severe.

With regard to Dr. Grimshaw's remark about the employment of alcohol "in the *treatment* of aneurism," the question under discussion was, how to meet the prostration left by exhaustive hæmorrhage; and I can very well imagine some strong believers in stimulants using them even in hæmorrhage from an aneurism.

The case to which I did allude was one which, I presume, Dr.. Grimshaw does not recollect, as he had not then entered the medical profession; but I need scarcely say that Mr. Cusack was much too good a surgeon to have used any form of alcohol in any stage of such a case, nor did I say that his failure had anything to do with such a cause.

Of those who were residents with me in Dr. Steevens's Hospital at the time, all are dead except one, who has left the profession. They were: S. A. Cusack, J. G. Hildege, Jas. Gwynn, and my elder brother.

What I think the public will learn from the successful cases of operation, &c., in the London Temperance Hospital is:—

1. How seldom alcohol is required, even in severe cases; and

2. How many cases do very well without it, that formerly were supposed to need it most.

And, as I said before, this hospital will continue to afford to the profession a landmark and point of comparison, even in those cases in which the different forms of stimulant are most really useful. This may, indeed, be bad for some individual patients; but it contributes to the advancement of science, and to the ultimate benefit of the greatest number.

I am, sir, your obedient servant,

Edward Haughton, M.D., &c.

Norwood.

Obituary.

FREDERIC TICEHURST, M.R.C.S., J.P.

It does not often fall to our lot to chronicle the decease of a more popular provincial surgeon than Mr. Ticehurst, of Hastings. Few of our readers who have visited that health resort during the last half century can have failed to become acquainted, or, at least, to have heard of the genial Ticehurst, who occupied at various times, and sometimes together, almost all the various posts either of honour or emolument attainable to a medical man. Medical Officer to the Union, Surgeon to the Dispensary, Surgeon to the General Infirmary, subsequently Consulting Surgeon to it and to the Home for Gentlewomen, Coroner, Justice of the Peace, and Mayor of the Borough, all combined to make him the best known, and one of the most respected inhabitants of the town. Deceased had been suffering from an internal malady for some weeks past from which there was no hope of release, and his death which occurred on Friday last, will be sincerely regretted by a large circle both in and outside the profession.

THE PUBLIC HEALTH (IRELAND) BILL.

THE Select Committee on this Bill was nominated on the 19th, and met for the first time on Monday last. It is constituted as follows:—Sir M. H. Beach. Messrs. Maurice Brooks, Gibson, Q.C., and Delahunty. Viscount Crichton, Mr. Gray, Sir A. Guinness; Messrs. Richard Power, Brett, Brien, James Carey, G. Beresford, Meldon, Verner, Biggar, MacCartney, Redmond, King, Harman, and Swanston. In the notice for the nomination of the committee it was stated that they would have "power to call for persons and papers," which signifies that oral evidence would be taken, and the whole question dealt with exhaustively. In the resolution of the House, however, which appointed the committee, these words were left out, it being thereby implied that its work would be confined to arranging clauses and improving phrases, and that no evidence would be taken. This was to be expected, inasmuch as it would be impossible to hear witnesses, if any hope were entertained of passing the Bill this year; but it is nevertheless much to be regretted in the interests of the sanitary officers and of the public, and there is no excuse for it because the Bill might have been read a second time, and referred to a select committee three months ago. The Council of the Irish Medical Association is alive to the importance of having the interests of the sanitary officers represented, and having been advised that the presence of a deputy in London was essential, have induced Dr. Grimshaw to go over to represent them. We are in some apprehension that there may be an attempt to rush the Bill unamended through the House in its dying moments, but the Irish Medical Association will no doubt be on its guard, and prepared to oppose it with all vigour, unless such changes be made in the measure as will make the Irish sanitary system a reality.

Literature.

PRACTICAL HISTOLOGY. (a)

ALTHOUGH numerous manuals of Practical Histology have been lately issued from the press, both in this country and on the continent, no more valuable text-book for the student will be found, nor one containing a greater amount of useful information, than Dr. Thin's "Introduction to Practical Histology." It is not too much to say of it, that it is as full as an egg of meat and matter. Its arrangements are practical to a degree, whilst its matter is presented in the most convenient form to beginners in the use of the microscope. The work commences with a brief description of the instruments ordinarily required in histological investigation, the method of cutting sections, &c. Little is said about the microscope itself, but that little is most useful; as, for instance, the magnifying power employed should not exceed 300 or 400 diameters, "for the use of high powers is, as a rule, to be avoided." In this recommendation we cordially agree; experience confirms us in the opinion we have had occasion to express, that little reliance can be placed on the boasted amplifications of 5,000 and 10,000 diameters of some writers. We also agree with Dr. Thin that magnifying power should not be increased by the use of high oculars, since "the gain is usually more than counterbalanced by loss of definition." Immersion objectives he especially recommends for high power work, and the method of employing them is clearly given, together with the measurements of objects both with the eye-piece and stage micrometers. A long and useful list of re-agents occupies several pages, and the details of their mode of application. For staining Dr. Thin, it appears, recommends a combination of logwood and acetic acid, a concentrated solution of which is found to rapidly stain tissues through and through; and which are afterwards macerated in glycerine and diluted acetic acid. By this method a tissue is rapidly bleached, but the nuclei do not become bleached so rapidly as the other elements, and as soon as these become visible the acetic acid is replaced as quickly as possible, by glycerine or water to arrest decoloration. We give the particulars of this method, because the student will find the number of nuclei stained by it exceeds that of any other, but Dr. Thin goes fully into the various dyes in use, and gives full particulars of foreign methods of staining, as that of Von Ebner for the examination of bone; of Gerlach for studying the termination of nerve fibres in muscle; of Cornil for tracing the course of amyloid degeneration; of Schwalbe for elastic fibre; of Löwit on the combined application of gold and formic acid in the study of nerves; and of Ranvier in the use of purpurine. These are but a few of the examples of methods of staining which have been described so recently that they are scarcely known to English readers; and the careful abstracts given of these will, we are convinced, prove useful even to experienced histologists.

The fluids of the body occupy several pages, and the tissues are treated of at considerable length. Dr. Thin takes occasion when studying the structure of muscle, cartilage, and the retinæ, for example, to explain in what way his own experience has led him to a divergence of views widely differing from those usually taught in text-books; and in doing so he is most careful to give full details respecting the methods he has employed; thus the student can with greater advantage follow out implicitly his teaching, and arrive at a definite conclusion for himself.

Although Dr. Thin does not profess to have exhausted the subject, he has certainly produced a most useful manual, one containing almost everything that the student in histology requires to become practically acquainted with, added to which his book has the further recommendation for students as being the cheapest histological manual published.

Medical News.

Royal College of Surgeons of England.—The following gentlemen passed the examination in Anatomy and Physiology at the July meetings of the Court of Examiners:—

Edward J. Biden, George B. Wall, and William E. Sicard, Charing-cross Hospital; Arthur Price, Frederick R. Walters, W. Williams, and S. W. Sutton, St. Thomas's Hospital; Samuel J. Gabriel, Norman Rushworth, L. P. Mark, Frank Rushworth, Charles P. Hooker, H. Smith, William Outhwaite, and Alfred S. Mackrell, St, Bartholomew's Hospital; H. M. Duncan, William R. Parker, Frank Parish, L. C. Ponsford, Albert H. Rees, H. Sainsbury, Robert S. Walton, J. E. Hine, and Frederick H. Tinker, University College; James Fulton, Toronto and St. Thomas's Hospital; Henry C. Burrows, Liverpool; James H. Greensill, Middlesex Hospital; A. H. Bampton and J. Smith, Westminster Hospital; V. E. Hunter, H. T. Griffiths, John G. Webb, H. W. Shettle, and L. R. Heyland, St. George's Hospital; Lawrence Humphry and A. C. Buller, Cambridge; Robert Brooks, G. M. MacDonald, and J. Balls, King's College; Percy Brown, London Hospital; F. S. Dennis, New York; J. J. Robins, and Wm. M. Taylor, Newcastle-on-Tyne; Arthur Harrison and J. W. L. Russell, Sheffield; Gilbert Kirker, Belfast; Albert Beverley and H. N. Oglesby, Leeds; W. R. Bates, John D. Hayward, A. Manners, F. E. Ackerly, and Alfred J. Pickworth, Liverpool; B. H. Dale and William P. Dester, Bristol; H. G. Brooke, J. K. Milne, E. L. Luckman, H. A.

Dixon, and William Gibbon, Manchester; O. Todd, Aberdeen; William A. C. O. Sankey, University College, Birmingham and Glasgow; William J. Baker, St. Bartholomew's Hospital; Seton G. Hamilton, and W. Dunn, St. George's Hospital; W. Benthall, Cambridge; Edward J. Freeman, Dublin; S. N. Rendall, and H. W. King, Edinburgh.

Of 137 candidates examined, 58 failed to satisfy the Court, and were referred for three month's further study.

King and Queen's College of Physicians.—The following gentlemen obtained the licenses in Medicine and Midwifery at the July examinations:—

MEDICINE.—Hen. Arthur Charlton, John Patrick Clarke, Joseph Clarke, Jas. Vincent Clinch, John Conry, O'Connel John Delahoyde, Ebenezer Donaldson, John Joseph Dingenan, Francis Charles Fisher, Samuel M'Culloch Higgins, John B. Jennings, George Kisby, George Lyndon, William Rowlands, James Foster Rugg, Walter Henry Ryan, Henry Robert Sherrard, Richard Baker Smith, John Henry Thompson, Richd. G. Tyner, Walter Henry Winter, James Harold Wilde.

MIDWIFERY.—Henry Charlton, John P. Clarke, James Vincent Clinch, John Conry, Freeman Wills Crofts, O'Connell John Delahoyde, Ebenezer Donaldson, John J. Dingenan, William Fairbank, Francis Chas. Fisher, Francis George Goodman, William Hamilton, Samuel Higgins, George Kisby, George Lyndon, Malachi O'Dwyer, J. Foster Rugg, Walter Hen. Ryan, Henry R. Sherrard, Richard B. Smith, Richard Gelling Tyner, James E. Thompson, John Henry Thompson, George Westby, James Harold Wylde.

The London Hospital.—On Wednesday last the Right Hon. W. E. Forster, M.P., occupied the chair at the annual distribution of prizes to the students attached to the above Hospital. The following are the chief prizes of the year:—Entrance Science Scholarship, £60, A. H. Lucas, B.A.; ditto, £40, Lloyd Francis, B.A.; Buxton Scholarship, £30, F. G. Stonham; ditto £20, J. Hutchinson. Scholarship in Human Anatomy, for first year's students, £20, F. G. Stonham; Hon. Certificate, A. H. Lucas, B.A. Scholarship in Anatomy, Physiology, and Chemistry, for second year's students, £25 A. Higgs; Hon. Certificate, L. E. Pritchard; Dressers' Prizes: 1st, £15, E. G. Sargent; 2nd, £15, A. Higgs; 3rd, £10, L. E. Pritchard; 4th, £10, L. N. Walker; 5th, £5, P. Brown; 6th, £5, J. W. Lynch. Scholarships in Clinical Medicine, £20, A. S. Oxley. Hon. Certificate, A. Bennett. Ditto in Clinical Surgery, £20, J. T. Fox; Hon. Certificate, F. B. Fisher; ditto in Clinical Obstetrics, £20, J. W. Lawton; Hon. Certificate, B. H. Gardiner. Prize for attending the greatest number of Maternity Cases during the year, £5, J. W. Lawton; Duckworth-Nelson Prize, Clinical Medicine and Surgery, £10, A. Bennett. Hon. Cert., J. T. Fox. Class Prizes, Medicine, Gold Medal, A. S. Oxley; Silver ditto, F. B. Fisher and J. Greasley. Botany, 1st. Prize, A. H. Lucas, B.A.; 2nd ditto, J. Rygate.

Court Appointment.—Lord Chamberlain's Office, St. James's Palace, July 16, 1877.—The Queen has been pleased to appoint Messrs. Peter Wyatt Squire and Alfred Herbert Squire, jointly, to be chemists and druggists upon the Establishment in Ordinary to her Majesty, *vice* Mr. Peter Squire, senior, retired.—*London Gazette.*

NOTICES TO CORRESPONDENTS.

AN APPEAL.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—We venture to hope that you will kindly allow us, through your columns, to call the attention of the profession to the case of Dr. de Lisle Allen who, after an illness of more than two years, is now an inmate of Bethlehem Hospital.

During the whole of his illness Dr. Allen has been incapacitated from following his profession, and his family have been indebted to the kindness of private friends, supplemented by a *grant* from the Medical Benevolent Fund for the means of defraying the expenses necessitated by the nature of his malady.

This appeal is now made to enable his wife and daughter to keep a home and to put them in a position of earning a livelihood for themselves.

Dr. Richardson, 12 Hinde Street, Manchester Square, London, W., has kindly consented to act as treasurer.

(Signed) J. ERICHSEN, F.R.C.S.
THOMAS SMITH, F.R.C.S.
BENJAMIN W. RICHARDSON, M.D., F.R.S.
J. HUGHLINGS JACKSON, M.D.

AN EXILE.—Your letter will appear in our next.

JUNIUS MEDICUS.—In our next.

A CASE FOR THE BENEVOLENT.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—I wish, with your leave, to bring under the notice of the benevolent the case of the late P. McCourt, of Birtley, Durham, surgeon. His untimely death of chronic pneumonia at the age of 36 leaves four little girls—the eldest only 9—and an aged mother in almost utter destitution. And his wife is so broken down that she is a proper candidate for some asylum or "home." At one time his life was assured for a moderate sum, but, through domestic and other difficulties, the policy was allowed to lapse.

A medical practitioner's fate in a mining or "club" district is peculiarly hard. In health he is overworked, and in sickness his patients desert him—those often do so the first on whom his claims are greatest for long and unwearied attendance in serious illness and in imaginary illness.

Such was Mr. McCourt's lot. Early this year he was struck down with pneumonia, and though kind friends did what they could to keep his practice together and to build up himself, the disease and his own anxieties conquered.

It is proposed now to place his mother and his four children in some "home." The wreck of his estate and "book-debts" realised will raise a little, and the charitable are appealed to for a little more. Any sums, however, will be gladly received and acknowledged by

Yours very truly,
Houghton-le-Spring, Durham, J. O'FLANAGAN, L.R.C.P.Edin.
July 21st, 1877.

DR. OGILVIE WILL.—Telegram unintelligible. Send proof for next week.

GUARDIAN.—Not of sufficient medical interest.

DR. HATTON.—No fee is charged to subscribers for the insertion of marriages, deaths, &c.

ERRATUM.—In our last number, on page 55, second column, line 16, for *charity* of any kind, read *chastity*, &c.

AN ERROR IN THE PHARMACOPŒIA.—In our last we pointed out an error which had crept into the last edition of the *British Pharmacopœia* at page 180. In the formula for liquor arsenicalis, the quantity of compound tincture of lavender is given as 5 fluid ounces, it should read 5 *fluid drachms*. Our readers should correct their copies in accordance with the above.

SCARCE NUMBERS.—Double price will be given for the following numbers of this Journal if sent to the London office:—October 6, December 22, 29, 1869

VACANCIES.

Metropolitan Asylum District.—Junior Assistant Medical Officer for the Imbecile Asylum at Leavesden. Salary commencing at £120, with board and apartments. Forms of Application to be had of Mr. Jebb, 37 Norfolk Street, Strand, W.C.

Wolverhampton General Hospital.—Physician's Assistant and Pathologist. Salary, £50, with board and lodging. Applications to the Chairman of the Medical Committee.

Farringdon Union.—Medical Officer for the Shrivenham District. Salary, £70, with fees extra, and £10 additional as Health Officer. Address the Clerk to Guardians, Farringdon, Berks.

Male Lock Hospital, London, W.—House Surgeon. Salary, £50, with board and apartments. Testimonials, &c., to the Secretary.

National Dental Hospital, London, W.—Two Assistant Dental Surgeons. Testimonials to the Medical Committee, 149 Great Portland Street, W.

Nuneaton Union.—Medical Officer for the Chilvers Coton District. Salary, £65, with the usual fees extra. Applications to the Board of Guardians, Clerk's Office, Nuneaton.

Celbridge Union Workhouse.—Medical Officer. Salary, £100 per annum, Election this day.

Queenstown Dispensary.—Apothecary. Salary, £70. Election this day.

Marriage.

BROMFIELD—HATTON.—June 10th, at St. John's Church, Coleford, Gloucestershire, by the Rev. Thomas Holbrow, Vicar, Edwin Bromfield, of Sydney, to Louisa Fenella Kate, youngest daughter of Dr. Hatton, of Coleford.

Deaths.

BELL.—On July 10, at Norwich, John Crawford Bell, L.S.A.L., aged 78.

BOULTON.—On July 12, at Beverley, Robert George Boulton, M.D., aged 72.

COTTERELL.—On May 23, at Nelson, New Zealand, Chas. E. Cotterell, M.R.C.S.

EATON.—On July 8, at Ancaster, Freeman Eaton, M.R.C.S., L.S.A., aged 69.

GROWSE.—On July 17, at Bildeston, Ipswich, Robert Growse, Surgeon, aged 79.

MALONE.—On July 11, John George Malone, M.R.C.S.E., Resident Medical Officer to the General Hospital, Queenstown, aged 56.

MCCOURT.—On July 13, at Birtley, Durham, Patrick McCourt, L.F.P. & S.Glasgow, aged 36.

O'REILLY.—On June 30, at Ballinagh, co. Cavan, of rheumatic fever and congestion of the lungs, Thomas S. O'Reilly, M.D., aged 56.

PERY.—On June 27, at Grays, Essex, Richard Hay Pery, M.R.C.S.E., aged 55.

TICEHURST.—On July 20, at his residence, 11 Carlisle Parade, Hastings, Frederic Ticehurst, M.R.C.S., J.P., and Coroner for Hastings.

WINN.—On July 19, after a short illness, William Winn, Captain in the Royal Scots, and formerly of the 29th Regiment, son of Dr. Winn, of Harley Street, London.

ABSTRACT OF CLINICAL LECTURES ON SYPHILIS.

By S. Messenger Bradley, F.R.C.S.,

Surgeon to the Manchester Royal Infirmary, and Lecturer on Practical Surgery, Owens College.

Lecture IV.—*Congenital Syphilis and Acquired Syphilis in the new born—Symptoms of Hereditary Syphilis—Prognosis—Evolution.*

Syphilis may be conveyed to the fœtus in utero through the placental circulation, or through a direct poisoning of the germ cells by a syphilitic sperm cell. Either parent may thus be the cause of the infant's suffering, in some instances the mother, and in others the father, altogether escaping contagion. When the child is thus poisoned it may nevertheless be born with every appearance of lusty health, the effects of the poison only manifesting themselves after a time. It thus becomes especially needful for us to distinguish between syphilis in the new-born child of a truly congenital character, and syphilis in the infant which is acquired after birth through the medium of the nurse's (not necessarily the mother's) milk, or other accidental source. In the first class we have to deal with congenital or hereditary syphilis, in the second with acquired syphilis in the new-born child. Let us now turn our attention to hereditary syphilis.

The effects of the poison upon the fœtus in utero are various. In a considerable number of cases the ovum is blighted, and miscarriage ensues, in others the child comes to maturity, but is born with abundant evidence of the working of the virus, in others, and these constitute a large proportion of the entire number, no symptoms exist at first, the mother giving birth to a well-grown and apparently healthy child. In this last series of cases the signs of syphilis very generally appear within the first three months of extra-uterine life; in three-fourths of the whole before the end of the first month; in seven-eighths before the end of the third month; the remaining one-eighth not developing symptoms till a still later period, the virus, perhaps, being latent till towards the close of the first year. Though the symptoms of infantile syphilis are, as a rule, perfectly well pronounced and easily recognised, it sometimes happens that they are of so slight and transient a nature, as almost to entirely escape observation, an important fact to note, inasmuch as these very cases may develop grave symptoms of deep-seated syphilitic mischief at a much later period. This has led some writers to say that hereditary syphilis may remain latent until the age of puberty. If, however, these cases had been closely and accurately studied, it would have been found that symptoms did appear prior to the period of the first dentition.

Since hereditary syphilis is conveyed to the child through some secretion of one or both parents, it happens that it appears *ab origine* in the guise of secondary syphilis, chancres being unknown, and buboes exceedingly rare. It will be desirable, before passing in review the effects of the virus upon the several tissues and organs of the child, to briefly consider the general symptoms by a historical sketch of a typical case.

A mother married to a man who had syphilis a dozen years before, but who for the preceding five or six years has suffered from no further symptoms than slight, but recurrent, attacks of palmar psoriasis, gives birth at the full period to a well-grown and apparently healthy child. The mother never exhibits the slightest trace of the venereal poison, either at this or any subsequent period. A fortnight passes, and the child begins to snuffle, breathing through its nose as though it had a chronic nasal catarrh. The skin about the buttocks, the palms of the hands, and the soles of the feet, become glazed and copper-coloured, or of a red hue inclining to copper, the child, previously plump, begins to dwindle, peak, and pine, and by-and-bye a look of age creeps over the little patient, quite altering its expression.

These symptoms yielding to treatment, leave the child for a time apparently well, but recur from time to time, the syphilitic roseola, which was the first rash noticed, perhaps being replaced by an attack of pemphigus, or eczema, in the later seizures. During the period of the first dentition frequent explosions of this kind take place; and the milk teeth themselves very possibly give signs of the disease, their front surface being scooped out, as by a little cheese scoop, leaving a dark-coloured dentine exposed to view. These syphilitic milk teeth are sometimes friable and weak, they often, on the other hand, outlast many a better looking set. The interval between the first and second dentitions probably passes over without any marked outbreak, but at the latter period the poison again announces itself in a characteristic way, the permanent teeth, especially the two upper central incisors, being deeply notched at their free edge, somewhat constricted at the neck, placed rather far apart, and inclining towards each other. About the same time the child begins to suffer from attacks of chronic keratitis, which leave the cornea damaged and opaque. It may be that the mischief stops here, so far as the eyes are concerned, or it may be that the iris, choroid, and retina, all participate in the disease, and that irreparably. The malady, even now, has not worked itself out, for likely enough it will be found that the bones are diseased, the nasal bones becoming necrosed, and they and the turbinals discharged along with a fœtid mucus. The articular ends of the long bones, and the shafts as well, becomes the site of a syphilitic osteitis, which, in some instances, leads to sclerosis, in others to necrosis. Still "not unscarred, yet living," the victim of hereditary syphilis struggles on into manhood, half-blind, half-deaf, and half-witted, for the brain has suffered from the dyscrasia along with the other tissues, the poor wretch presents a miserable object, eyes opaque and far apart, flattened nose, cheeks scarred and seamed with old cicatrices, a perforated palate, one elbow anchylosed, and one knee diseased, the cellular tissue riddled with ulcers, the viscera studded with gummata, and still a feeble tenure of life is held until the close of the miserable performance is at last ushered in by an attack of fibroid phthisis. This is not a fancy sketch, but a picture of what is to be seen around us every day. We will now proceed to consider the effects of the poison upon the several parts of the organism.

Integumental System and Mucous Surfaces.—The lesions which affect the skin in infantile syphilis, like the deeper tissues, are peculiar in presenting features common to both the secondary and tertiary periods. This is indeed a common and important feature of infantile syphilis generally, and goes far to show that the tertiary evidences are essentially one with the secondary. We constantly meet with cases, for instance, of gummous deposits in the liver, associated with syphilitic erythema of the skin, and in the skin itself both forms of exudation may be present, an ecthyma in one situation occurring synchronously with a pemphigus or impetigo in another. Roseola, eczema, impetigo, pemphigus, and ecthyma are the most common skin diseases met with in hereditarily syphilitic children. Roseola is, indeed, rarely absent in these cases, and nearly always glazes with a most characteristic rash the skin of the buttocks and adjoining parts. As in adults, too, the nails and hair often suffer. A syphilitic onychia may destroy the matrix, and thus cause the nails to perish, or a syphilitic affection of the hair-bulbs may cause the hair to fall.

As to the mucous surfaces, we constantly see mucous patches or condylomata about the anus, and less often about the mouth, while the affection of the Schneiderian membrane (which is an almost invariable accompaniment of the disease) is really due to the development of similar growths upon the mucous lining of the nose. The mucous surface of the larynx is also sometimes affected in hereditary syphilis: the cry becomes hoarse, and, in rare instances, tracheotomy has to be performed to prevent impending suffocation from œdema glottidis. Even further than this, hereditary syphilis may seize upon the mucous lining of the bronchial passages, giving rise to a true syphilitic bronchitis; but this affection is very rare—indeed, is scarcely a recognised sequel of the poison.

Organs of Locomotion.—Occasionally the muscles, less frequently the tendons, and comparatively often the bones, are affected. In the muscles the disease presents itself in the form of gummata; the same is the case with the tendons. The bones are sometimes the seat of a specific osteitis, which leave them thick and heavy, or may pass on to necrosis; in this way the bones of the cranium, of the fore-arm, the leg, or the bones of the chest—*i.e.*, the sternum and ribs—are liable to be invaded.

My own experience leads me to believe that these affections of the osseous system are specially prone to occur about the age of puberty. The diseased bone slowly enlarges, loses its shapeliness, and is the seat of a dull pain; not unfrequently ecthymatous ulcers form over the inflamed bone, and eventually a sinus may lead down to some necrosed portion. Extensive masses may exfoliate in this way, the nasal and turbinated bones are thus often naturally removed, or the hard palate may be almost entirely lost. These ravages are, as a rule, repaired by permanent (and necessarily disfiguring) cicatrices. When necrosis ensues we generally find that the covering of the bone and the soft parts above the dead portion have been the first affected, and the vascular supply first lost by the periosteal source being cut off.

Lesions of the Viscera.—The viscera are all liable to the inroads of syphilis, when the disease is hereditary. The *liver* is frequently the seat of gummatous exudations, and the icterus of new-born children is sometimes directly due to a syphilitic taint. The peculiar cachexia which characterises syphilitic children, and tinges their skin the colour of yellowish-white paper, is generally associated with a syphilitic condition of liver, and this complication may always be suspected when the motions are acholic, scanty, and extremely fœtid.

When the *kidneys* are attacked, the functions of the *tubuli uriniferi* are interfered with, and albuminuria is established; this condition is less rare than is generally thought, and its syphilitic origin may be fairly inferred when the albumen disappears under a mercurial treatment.

We have already spoken of the coryza, which forms so prominent a symptom in hereditary syphilis. A constant snuffling is often our first intimation of the existence of the disease; this, as we have seen, is due to the development of mucous patches in the Schneiderian membrane. We have also mentioned that the cry of hereditarily affected children is often veiled and hoarse, and this condition is due to a syphilitic laryngitis. Extending our researches in the same direction, we find the poison producing effects on the remoter parts of the air-passages, and even on the *lungs* themselves; in some instances bronchitis, in others pneumonia, being the type of disease assumed. It must be conceded, however, that there is no special symptom—nothing, indeed, but the general history and the conduct of the disease under treatment—that warrants our attributing these maladies to the direct influence of the venereal poison.

The brain and spinal cord are, more clearly than the lungs, often injured by the ravages of syphilis. Sometimes a more notably inflammatory type of disease is set up, such as meningitis, which runs a rapid course; in others more chronic affections, and such as characterise the tertiary rather than the secondary period of syphilis, are the type we meet with.

Poured out into the substance of the brain in early childhood, a common effect of syphilitic exudations is to dull the intellect by dwarfing the development of the brain; or it may be that, occupying a cortical situation, epilepsy may be induced, or, if placed upon the origin of some nerve, a peculiar paralysis may be caused. Thus ptosis, or strabismus, or facial palsy are each and all occasionally attributable to the working of the virus. Thus again, in the spinal cord, paraplegia (either sensory

or motor) is sometimes encountered, though this is a very rare lesion.

The Senses.—Even more common than syphilitic affections of the brain are syphilitic diseases of the senses, and especially of the eye. As a rule, this class of affections does not show itself for some time after birth, the first symptom very likely occurring during the period of the second dentition. Every part of the eye may be invaded. The cornea is, however, most frequently seized upon, an interstitial keratitis at this period being generally regarded as pathognomonic of a syphilitic origin. When keratitis does occur, the eye loses its lustre, and the cornea often becomes quite opaque. The choroid may be selected, but when this happens the retina generally suffers too, a *retino-choroiditis* being lighted up, which very frequently extinguishes the sense of sight altogether; or, again, the iris may be picked out, and the resulting iritis run just the same course as in the acquired form of the disease; or, lastly, it may be that the lens, or its capsule, bears the brunt of the syphilitic attack, and then opacity of the one tissue or the other—that is to say, *cataract*—occurs.

The ear, too, is almost as frequently the seat of disease as the eye. In the meatus *condylomata* may be found, but more usually it is the middle ear which suffers, and in this case the membrana tympani is ruptured and the ossicles are discharged through the rent, probably along with a goodly portion of the tympanic walls. This is a frequent cause of incurable deafness.

The prognosis of infantile syphilis differs so markedly from that of acquired syphilis, that it will be well to consider it in this place.

Prognosis.—Acquired syphilis, though often indirectly, is rarely directly a fatal disease; such cannot be said of infantile syphilis, which yearly claims thousands of victims. This greater gravity of the disease in the child than in the adult, is due partly to the power of resistance being less in the organism of the very young, partly to the fact, that the poison being conveyed through the blood current vitiates and injuriously affects every cell and every tissue, damaging not only the cells of *nutrition* as in the adult, but the cells of formation too; and lastly, the greater severity is due to the fact that the explosions of syphilis in the child are rather universal than scattered and confined; in the adult, first one part and then another suffers, but rarely many different tissues at the same time; in the infant the disease, being a diathesis from the first, may burst out in almost every organ and every tissue of the body at one and the same time. No wonder that in this triple cause, we have so great a mortality from infantile syphilis.

Finally, in regard to the mode of infection, it will suffice for the student to know that the disease may be transmitted either through the mother alone, or through the father alone, or by both parents being diseased; or in extra-uterine life it may be conveyed through the milk of the nurse, or indeed, through any secretion in a syphilitic subject: and on the other hand, it must be borne in mind that the disease is equally communicable from the child to its nurse.

I cannot dismiss the subject of infantile syphilis, without remarking that I am strongly inclined to believe that we meet with cases which show a true transmutation of type, changing from syphilis, not only into struma, but into cancer, and thus afford evidence of the possible evolution of this terrible malady. I will illustrate my meaning by the brief record of a case which I have most carefully and closely watched. Three years ago, a lady had a son who developed symptoms of hereditary syphilis the week after birth. The father was at the time suffering from constitutional syphilis, but the mother altogether escaped. In spite of early and vigorous treatment, the disease in the child was not subdued; one form of lesion only gave way to be replaced by another: the integument over the greater part of the body was often red and glazed; and there was very generally a troublesome coryza. During the second year, *inter alia*, we had to deal with an ostitis of the left tibia and left radius. It was while the disease was thus unfolding itself, during the second year of extra-uterine life, that the conjunctiva and cornea of the right eye became inflamed. My friend, Dr. Little, saw the child on the outbreak of this symptom, and pronounced the eye mischief to be of syphilitic origin. Here again, the disease baffled us, and after a vigorous but futile attempt to arrest the progress of the malady, Dr. Little, pronounced the eye destroyed, owing to an extension of the inflammation to the choroid and the retina. Fearing that the other eye might suffer sympathetically, and the child, being in pain, it was resolved to extirpate the diseased globe. At the time this was done, both Dr. Little and myself observed that there was a slight protrusion of the eye-ball, which had only become apparent within the last few days; this protrusion he was inclined to attribute to intra-ocular pressure, but on cutting through the optic nerve, he found a small tumour which invaded the retina in this situation. The whole of the growth was removed and the eye closed.

This growth, which was found to spring from the site of a typical syphilitic patch on the retina, was examined by Dr. Dreschfeld and Dr. Ross, as well as by other members of the microscopical section of the Manchester Medical Society, and was unanimously pronounced to be an encephaloid tumour. It is true that the disease has not yet returned in the stump of the optic nerve, but it is only six months since the complete removal, and I do not think we can afford to doubt the decision of such excellent observers as those I have named. The parents are people of good social standing, and can trace back the family history for many generations: in neither side has there ever been a case of cancer, so far as they can tell. Such are our facts in regard to this case, and we have to decide whether it is most rational to conclude that the carcinoma is a mere coincidence, pointing to a cancer strain in some remote progenitor, which now crops up atavistically so to speak, like the ever recurring blue bar in the domestic pigeon, or whether it is more rational to regard the carcinoma as the outcome by evolution of the preceding syphilitic affection. I confess my own leaning to the latter view; look at the histology of the retina, and note the histology of a glioma, of a cerebral gumma, and of an encephaloid tumour of the retina; no mighty change seems necessary to transmute one cell growth into another. I do not expect to gather grapes of thorns, nor do I look for the evolution of a sarcoma from a carcinoma, but we have not so strange a genesis here; nothing indeed but a tumour which, though truly cancerous, is yet of a structure which histologically is very closely allied to the early character of rapidly growing nerve tissue. The whole subject of evolution of disease is one of much interest and importance, and I think such cases as the above are worth chronicling, and that taken with other facts, such as the frequent development of epithelioma of the tongue from previous syphilitic rhagades, of scirrhus of the breast following chronic eczema of the nipple, of epithelioma of the leg, following long continued irritation of a syphilitic ulcer, it lends real weight to the argument that a true evolution of cancer from syphilis is possible without any hereditary cancer strain.

THE TREATMENT OF CERTAIN FORMS OF TINNITUS AURIUM.

By W. Douglas Hemming, M.R.C.S.,
Clinical Assistant, Central London Throat and Ear Hospital.

There is probably no affection coming under the notice of the Aural Surgeon which is more distressing to the patient or more embarrassing to the practitioner than the symptom of singing in the ears. The word symptom is used advisedly, because it is a mistake to consider it as in itself a disease. Tinnitus is but a manifestation of several different diseased conditions of the auditory apparatus. There are numerous varieties of it. Dr. Lawrence Turnbull, of Philadelphia, whose little work

on this subject contains the best account to be met with of the several kinds, mentions eight different classes, dependent on as many causes. The varieties most frequently met with, however, are those connected with the following conditions: 1. Impacted cerumen. 2. Otorrhœa. 3. Chronic catarrh. 4. Altered condition of the labyrinthine circulation. 5. Inactivity of intra-tympanic muscles.

With regard to the treatment of these conditions an experience of hospital cases during the period that I have witnessed the practice of, and been associated with, Mr. Lennox Browne, leads me to conclude that in the first class of cases the removal of the wax, and one application of the Politzer bag, usually suffices to stop the noises; in cases dependent on otorrhœa there is not unfrequently a polypus or other inflammatory new formation present, and the tinnitus is generally relieved when the otorrhœa ceases; while in purely catarrhal cases the hydrochlorate of ammonia, a remedy much recommended by the late Mr. Hinton, will be found of value.

It is with regard to the last two varieties—viz., that dependent on congestion of the labyrinthine blood-vessels in which the tinnitus assumes a throbbing or pulsating character, and that in which there is inaction of the intra-tympanic muscles—that I desire to speak at present. For the treatment of the cases of pulsating tinnitus, many remedies have been proposed and tried, such as compression of blood-vessels, the administration of digitalis, aconite, bromide and iodide of potassium, &c., &c.,

Few of these have met with much success, but quite recently a drug has been introduced which seems to promise well in this direction. This is hydrobromic acid, which was brought before the profession in this country by Dr. Milner Fothergill, in a communication to the *British Medical Journal*, July, 8, 1876. In that paper, based on an extended use of the remedy, Dr. Fothergill says, that hydrobromic acid obviates the headache caused by quinine, and is very useful in forms of excited cardiac action where there is general nervous excitability and nervous exhaustion. From these facts, it would seem that the use of this drug would be indicated in those forms of tinnitus which resemble the effects of cinchonism. At a recent meeting of the Harveian Society, Dr. Woakes called attention to the value of hydrobromic acid in aural cases of the class under consideration, and in the *British Medical Journal* of June 23 he has narrated two successful instances of its use. Immediately after Dr. Woakes's remarks at the Harveian Society, the drug was prescribed at the Central London Throat and Ear Hospital, and the following case, which I quote by permission of Mr. Lennox Browne, under whose care the patient was, will serve as an example of the results obtained. J. S. æt. 34, applied at the Hospital on May 11. He was very deaf, hearing the voice only when much raised, and the watch not at all, but complained most of tinnitus of a "thumping" character which had existed for twelve years. He was ordered 15 minim doses of hydrobromic acid three times a day, and inhalation of benzole. On June 4, he said the noises had entirely stopped, and that his ears felt much clearer. The hearing power was not perceptibly improved.

It would appear from this and other similar cases, that we have now a drug of very great value for the treatment of this form of tinnitus, and it is to be hoped that a more extended trial will confirm the promise thus given.

In those forms of tinnitus, dependent on inaction of muscles, or "paralysis of the intrinsic muscles of the ear," faradism seems to be a really valuable agent. Several cases have been treated in this way at the Central London Throat and Ear Hospital, by means of Stohrer's battery with very marked good results. The current may be applied either direct to the membrane or over the mastoid process. According to the experience of all practising at this hospital, the latter method is quite as efficacious as the former, and much more agreeable to the patient. There cannot be the slightest doubt, that the application of the rheophore direct to the membrane, be the current ever so weak, often causes very acute pain.

In neither of these two varieties of tinnitus has there been any appreciable improvement in the hearing power, due to the remedies directed to the noises in the ears. On the other hand, deafness may often be considerably relieved, especially when it is due to chronic middle ear catarrh, without any abatement of the distressing tinnitus, until special measures to combat that symptom be employed.

DR. DE WECKER'S CATARACT OPERATION,

WITH THE STATISTICAL STATEMENT OF THE RESULTS BY DR. MASSELON.

Translated by H. Macnaughton Jones, M.D., M.Ch., F.R.C.S.I. & Edin.,
Surgeon Cork Ophthalmic Aural Hospital, &c.

Introductory Remarks.

Any one who has perused the remarks of Dr. De Wecker in his Ophthalmic Report for 1875 must have been greatly interested in the peripheral flap operation for nuclear cataract which he then advocated. The peripheral flap comprises the upper third of the cornea which is detached very exactly from the sclerotic, presenting a height of 4 mm., and adapts itself with an exactness as perfect as we might hope to obtain with a Græfian section. This flap, 4 mm. in height, gives, deduction being made for the thickness of the cornea, an interior opening of 9·32 mm. This opening, Dr. De Wecker asserts, permits of the exit of the largest cataract, or one 8·5 mm. in height and 4 mm. in thickness, without any great bruising of the parts. Dr. Wecker, laying great importance on the preservation of a circular pupil and the avoidance of mutilation of the iris, and the chance of sympathetic changes, operated by this peripheral section without disturbing the iris, employing eserine to prevent the prolapse which otherwise might occur. The instruments required are, a knife double the width of that of Græfe, a cystotome, and a small vulcanite spatula. The steps of the operation are briefly as follows: if the right eye be the one to be operated on, the operator, standing or sitting behind the patient, raises the eyelid with the forefinger of his left hand, and an assistant fixes the eye with a forceps. If it be the left eye, the operator coming in front of the patient, the assistant raises the eyelid and the operator fixes the eye with a forceps held in the left hand. He next detaches the upper third of the cornea from its insertion into the sclerotic. Fixation is abandoned when the incision is made and the flap is being completed. So as to avoid the bleeding which would interfere with the extraction of the crystalline and the introduction of the cystotome, the section is completed without forming the conjunctival flap, the cutting edge of the knife being directed slightly forwards. The second step in the operation consists in opening the capsule with the cystotome. The operator now raises the upper eyelid and directs the patient to look a little downwards; he then exercises a gentle pressure on the corresponding lip of the wound, at the same time that, with the help of the lower eyelid applied against the lower part of the cornea, he pushes the crystalline upwards. The pupil is cleansed completely after the evacuation of the lens, and then, if it so requires, the iris is reduced by the spatula, which is gently inserted into the anterior chamber between the lips of the wound, pushing the iris softly before it. Before the patient lies down eserine is instilled into the eye, and, again, when the operation is completed and the pupil clear and circular, eserine is employed. The vision of the patient is next examined, and then a third instillation of eserine is used, and the eye put up.

With these preliminary observations, culled from last year's report, I venture to give the results of the operation and the remarks as published by Dr. Masselon, *chef de clinique*, in the recent report for 1876.

Cataracts.

During the year 1876, 260 operations for cataract were performed at the Clinique. These operations may be classed as follows:—

Simple Cataracts . . .	222
Complicated „ . . .	15
Traumatic „ . . .	1
Congenital „ . . .	4
Zonular „ . . .	1
Secondary „ . . .	17

Not including the congenital cataracts and the zonular one, for which "discision" has been used, the others, with the exception of the secondary ones, have been operated upon by extraction. The secondary cataracts have all been dealt with by the "capsulotome," except in one case, in which a very light film existed, for which discision was resorted to.

Simple Cataracts—222.

Except in four cases, in which simple linear extraction has been employed, the other simple cataracts have been extracted sometimes by the peripheral flap method, sometimes by that of De Græfe. These 218 cataracts are thus found divided exactly into two equal groups of 109 each, so that De Græfe's method has been used precisely the smae number of times as extraction by the peripheral flap.

We may dispose at once of the simple linear extractions by saying that we have not had a single accident. In one case the vision equalled 2-5ths, in another, 1-10th (an old choroidal atrophy existed, localised towards the macula). The other two cases occurred in young persons, and the vision has not yet been determined. The 109 cases of cataract operated upon by De Græfe's method have furnished the following results:—

First, as regards the vision.

With 13 persons	operated on	. .	S = 1
„ 16	„	„ . .	S = 2-3rds.
„ 17	„	„ . .	S = 1-half.
„ 22	„	„ . .	S = 2-5ths.
„ 7	„	„ . .	S = 2-7ths.
„ 12	„	„ . .	S = 1-5th.
„ 4	„	„ . .	S = 1-10th.

Eleven persons operated on have not yet come to choose their glasses, and the vision has not been shown in the above table. In seven cases a closure of the pupil has occurred; of these patients the greater number had already successfully undergone iritomy. We have not had a single case of suppuration. Once only there was an issue of a small quantity of vitreous humour at the moment of the escape of the lens. We now come to 109 cases of cataracts extracted by the peripheral flap process. The following, beginning with the vision, are the results obtained:—

With 19 persons	operated on	. .	S = 1
„ 8	„	„ . .	S = 2-3rds.
„ 20	„	„ . .	S = 1-half.
„ 13	„	„ . .	S = 2-5ths.
„ 14	„	„ . .	S = 2-7ths.
„ 12	„	„ . .	S = 1-5th.
„ 9	„	„ . .	S = 1-10th.

The vision of eight persons operated on does not appear in this table, as they have not yet returned to the hospital for their glasses. Closure of the pupil was noticed in three cases only; and with three patients, suppuration of the cornea, which in one case was only partial, has occurred. The escape of the vitreous humour has taken place three times. With eleven patients we have had to record with variable degrees a prolapse, or an adhesion of the iris.

Before entering on a discussion relative to the results obtained by these two different methods, and laying stress on an important modification applicable to extraction by the peripheral flap, we shall pause one moment in the choice that it is advisable to make between these two essentially distinct modes of procedure. In an important work, "History of the Cataract," which M. Magnus has just published, our eminent *confrère* ends the chapter relating to the history of flap extraction with this remark: "It appears to us of very considerable importance for the future prospects of flap extraction, that an ophthalmic authority like De Wecker should have again, in the year 1875, declared himself in favour of this operation." From this observation, closely following on the statement of De Hasner's modification, the warmest defender of extraction by flap, it might be thought that Dr. De Wecker had completely given up linear extraction in favour of the flap method. This is not so, however. Already, in our last year's report, we have dwelt on the point that extraction by the peripheral flap, although giving the most perfect results, and offering a security quite as great as De Græfe's method, yet in certain cases was in danger of giving rise to prolapse and adhesions of the iris, notwithstanding the use of eserine. This (taking into consideration that ulterior glaucomatous complications were to be feared) it was necessary to avoid as much as possible by reserving these cases for a method of combined extraction.

The tension of the eye, the mobility of the iris, the capacity of the anterior chamber, the maturity and consistency of the cataracts, have been in each case the subject of a careful and minute study, so that a reasonable choice might be made concerning which operation it would be advisable to perform.

The following practical rules have then be drawn up:—

1st. All the eyes attacked by cataract, the tension of which exceeds the physiological condition (T=1 of Bowman), are dealt with by combined extraction.

We are quite convinced that the mobility of the sphincter, and its very strong contraction, stimulated still more by the use of a strong solution of sulphate of eserine (*au centième*), could not give a sufficiently certain guarantee against the complications of a prolapse, which may be occasionally caused, even when the wound is well adapted, through an effort made by the patient some time after the operation.

2nd. Whenever a large portion of the cortex has retained its transparency, and the cataract presents a sufficiently marked degree of immaturity, we prefer to use the combined method which allows of a more prolonged and more exact evacuation of the crystalline transparent masses accumulated at the capsule. By making the section sufficiently large, as has been stated in one of the preceding reports, it is possible after excision of the iris, to remove in their entirety immature cataracts, and thus allow the patient to have the benefit of the operation often several years before the time for which he would have had to wait for the full maturing of the cataract.

3rd. When we are dealing with a capsulo-lenticular cataract, where a large central mass occupies the crystalline surface, we prefer De Græfe's method to extraction by the peripheral flap. If we are indeed desirous in such a case to spare the iris, we strike with the cystotome, when the section is finished, and the pupil contracted, on the dense resisting part of the capsule, and we experience difficulty in incising the capsule without dislocating the lens. Even after having avoided this danger, it is very necessary after the escape of the lens, to remove the capsular layer, which is by no means easy when the iris has a tendency on all sides to overlap the edges of it, making it necessary to seize a portion between the teeth of the forceps. The combined method, on the contrary, singularly facilitates this delicate operation. Just at first after the excision of the iris, the capsule is easily opened by traversing the upper edge of the mass, that is to say, by incising the capsule towards the equator of the lens, while it is easy to seize the capsular mass, showing itself by its edge in the artificial cleft, and, to coax it, as well as the sack gently out, in such a manner as to place the

eye in favourable conditions for a certain and very rapid recovery.

With these reservations, we can undoubtedly submit the other cases to extraction by the peripheral flap. Supposing the case to be soft cataract which no longer, owing to the presence of a small nucleus, is suitable for simple linear extraction, the extraction by peripheral flap (the maturity being complete) allows a complete evacuation of all the cortical masses, and a perfect clearness of the pupil, even keeping the iris intact. We are firmly convinced that hard cataracts, arrived at full maturity, and still more those in which the cortical masses are in a fair way of retrogressive transformation, and which have, by absorption of a portion of their water, become agglutinated to a very large nucleus, should, when the degree of intra-ocular tension is not opposed to it, be exclusively reserved for Dr. De Wecker's method. The greater size of the section, in comparison with that which is made for combined linear extraction, then allows the cataract to come out *in globo;* no clearing is necessary, and we avoid the unpleasantness of seeing the thickened masses of the cortical substance forming the periphery of the lens, break, as happens often enough in De Græfe's method, where we are in danger of leaving in the eye one or several fragments, which we often find a difficulty in removing. The quickness of the recovery, and the perfect result should prevent the conscientious practitioner from abandoning himself to routine, and should deter him from submitting these cases so suitable for extraction by flap, to an extraction with mutilation of the iris; besides, De Græfe himself had recognised certain difficulties arising from the evacuation by linear section of large-sized cataracts. In opposition to these rules so wisely laid down by Dr. De Wecker, it will be said, that, not only does the peripheral flap method demand great dexterity on the part of the operator, but also gives rise to the necessity of having skilful assistance and a certain docility on the part of the patient, if we do not wish to have recourse to anæsthetics.

A very simple modification, and one which renders the method of extraction by the peripheral flap infinitely easier, is its performance inferiorly. What specially induced Dr. de Wecker to make the section upwards was the fear that the friction of the lower eyelid might act very unfavourably on a prolapsed iris, in the case where this accident would occur. But this objection ceases to have any weight, considering the rarity of such a complication, when first, we eliminate the cases in which the intra-ocular tension is very marked; secondly, when we take care, the patient lying down for the operation, to instil one drop of a solution of sulphate of eserine (*au centiéme*) and to repeat the instillation once or twice after the extraction of the cataract. The coaptation of the flap, four mm. in height, falling exactly within the sclero-corneal limit, is so perfect, that we need not regret the advantage that the upper eye-lid affords in the case in which the section has been made upwards, if we keep the flap *in situ*. The complete evacuation of the cataract that decided us on the choice of the above-mentioned cases, does not permit of a greater cleanness of the section, when the latter has as its seat the upper part of the cornea. On the other hand, it is very easy to enumerate the advantages that the placing of the section downwards offers for the performance of the operation. Just at first the degree of tranquillity of the patient has nothing to do with the question, the eye to be operated on turning instinctively upwards, and generally remaining steadily in that position. There is no longer any need of skilful assistance; it is sufficient to raise the eyelid, and to keep it thus so as to allow of the section being made. The operator ought always to fix it himself, by seizing a conjunctival fold quite close to the vertical diameter of the cornea; the fixing will not be given up till the section is nearly terminated. The act of opening the capsule (a delicate matter in the method by the superior flap) becomes very easy when the eye, turning upwards, is held thus immovable during the time of this operation. It is scarcely necessary to raise the upper eyelid a little to expose the pupil. Finally, if a reduction of the iris, in consequence of a prolapse, becomes necessary, this little operation is singularly facilitated when the section is made downwards. The docility of the patient being above everything important in this instance sufficient steadiness of the eye is obtained by the patient turning his eye forcibly upwards.

Here we will make an observation on the comparison to be drawn between the results obtained by linear extraction and those obtained by the peripheral flap operation.

We find, out of an equal number of cases, three suppurations for De Wecker's method, whereas for combined extraction with peripheral flap not a single case of suppuration has been observed. This fact, which apparently is opposed to extraction by peripheral flap, loses its value if we take into consideration the small number of cases on which it bears, which does not even allow us to draw conclusions within *mathematical probability* (Hirschberg). It is, without doubt, a question of pure chance, if this year, out of 109 extractions by De Græfe's method, no case of suppuration has occurred; and the three cases furnished by an equal number of extractions by peripheral flap, would certainly not be found excessive, if De Græfe's operation had been adhered to.

A number of cases, apparently great enough, would not permit of a reasonable deduction so far as concerns the probable percentages, and this results from the following fact:—The three suppurations observed during the year 1876 occurred in the first four months of the year. From the 4th of April to the end of the year, 188 operations were performed by the two methods indicated above, and there has not occurred a single case of suppuration. To what an erroneous conclusion we would have arrived, if, in drawing up statistics, we had exclusively adhered to that period of the year!

We often attach small importance to statistics, and, indeed, we must acknowledge that they frequently give rise to false estimates. We may easily be led into error regarding the given degree of vision, sometimes because the patients are examined too soon after the operation, sometimes because after this examination accidents still occur, and finally, because they do not present themselves for the functional examination (sometimes the patients are not again seen till four or five years afterwards, when they come for the operation on their second eye). But it is quite otherwise as regards the *immediate* result of the operation, and especially the cases of total or partial suppuration. To doubt on this point the correctness of a statistical table, is to directly impeach the truth of the reporter. Professor Cohn, who has in a sense created a statistical speciality in our special department, thus expresses himself with regard to the reports annually published of the Clinique: "To do away with the objection that the figures furnished by the institution cannot be regarded as *current coin*, I have proposed that this statistical table should not be drawn up by the person interested, but that—as Wecker and Coccius have already done—it be drawn up by assistants." That such a precaution is not sufficient to vanquish the incredulity of certain critics, is clearly shown by the uncourteous reflections which have been passed on Dr. De Wecker in a special paper (of trivial importance, however), and which should have been addressed exclusively to me, whose business it is to draw up the figures of the annual reports, for which I hold myself responsible.

THERE was a slight increase of deaths from small-pox in London last week—from 32 of the previous week to 35. Of these 22 occurred in public institutions, and 13 in private dwellings; 16 were certified as unvaccinated, 8 vaccinated. The remaining 11 certificates did not state as to vaccination.

Clinical Records.

CASES IN PRACTICE.

By J. Martin, F.R.C.S.I., L.K.Q.C.P.I., &c.

Rheumatic Fever treated with Salicylate of Soda.

Case I.

I was called on Saturday morning, May 5, 1877, to see John Howard, æt. 12.

He was a slight, rather delicate boy, and had gone out four days previously to swim in fresh water during the prevalence of easterly winds. He was attacked the following day with pain in the wrists, knees, and ancles. When I visited him he was suffering agony, the knees greatly swelled, and with an inflammatory blush over the sides of the patella, his wrists, too, were tense and painful, and every motion accompanied by a groan, his pulse 120. Temperature 104·3; his bowels had been acted on by a dose of oil the previous day. Anticipating a serious and prolonged attack, I proposed to move him into hospital, but his mother begged to keep him at least until the following Monday, to which I reluctantly consented. I gave him a subcutaneous injection of 1-4th grain of morphia, followed by half a drachm of the salicylate of soda in solution every four hours.

I called on Monday with a view of removing him to hospital, but I found the boy actually convalescent, free from pain, fever, or swelling. I gave him a mixture of iod. potass and cinchona, and he has had no relapse.

Case II.

July 12th.—Called to see Pat Power, æt. 22, suffering under an attack of rheumatic fever, which set in three days ago with a rigor; left wrist swollen and intensely painful, both knees swelled and painful, and ancles also painful, tongue clean, bowels opened by a dose of castor oil. Temperature 103, pulse 100, restless and unable to sleep.

I ordered half a drachm salicylate of soda every four hours.

14th.—Called to see him and found him up and walking about the house; said that the medicine had made him perspire freely, and that the pains were gone. Temperature normal, pulse 80, looks well, but weak.

16th.—He called at the dispensary, saying that he was quite well, but felt weak:—

℞ Iod. potass, ʒss.;
Bicarb. potass, ʒij.;
Sp. chlorof., spt. ammon arom. aa, ʒij.;
Infusion cinchon, ad. ℥xij.;
Coch. mag. ij. bis in dies.

Case III.

June 16th.—I was called to see a male child, aged 18 months. He had been delicate for some time, and was taking Parish's syrup, on which, the mother states, he had improved considerably. At 4 o'clock, p.m., he was suddenly seized with convulsions, and remained in them up to the period of my visit, four hours afterwards.

I found him on his mother's lap, face, hands, and legs convulsed, insensible, pallid countenance, eyes staring, and pupils widely dilated. His bowels had been rather loose, with white stools. Pulse 140; temperature 104.

Looking on it as an extreme case, and thinking any treatment justifiable, I stripped the child and drenched his body with cold water, then wrapped him in a blanket, applied a small blister to the nape of the neck, put a powder of two grains of calomel and one grain of pulv. Doveri on the child's tongue, leaving another to be given in three hours' time, followed by three grains of bromide of potassium after each dose, and in continuation.

Next morning I found the child quite sensible, free from convulsions, and, though delicate, as likely to improve as before the attack. The powder had acted on the bowels twice during the night, and the character of the motions altered, being now green.

July 16th.—The child has steadily improved.

18th.—Is quite well.

I attribute the child's recovery as much to the Dover's powder as anything else. The cold douche was followed by reaction, but the convulsive twitchings did not cease until sleep set in, and although the calomel acted freely on the bowels, they were not overloaded, and the effect of the opium was marked, the child being evidently under its influence. In another case I shall resort to opium with greater confidence.

A GLIMPSE AT A COUNTY COURT IN RELATION TO THE MEDICAL PROFESSION.

[BY A CORRESPONDENT.]

Some of your readers whose "lines have fallen in pleasant places" may wonder what possible interest the profession can have in such an institution as the county court, or debtor's court, as it is called in some parts, but my hard-worked and ill-paid *confrères*, I am afraid, are only too well acquainted with its organisation, its annoyances, and its necessity. It is used not only in disputed cases, but in many parts of the country the practitioner is obliged, periodically, to enter large batches of his patients who will not pay until extreme pressure is put upon them, and some of whom even like the process, as they thereby can extend their mode of payment, and by pleading their inability, will often, for an account of five guineas, be allowed to pay 2s. 6d. a month.

The number of cases entered annually by general practitioners is unfortunately very large, and this arises from many causes, most of them not from our harshness, want of charity, or love of money, but rather from a deficient system both of medical book-keeping and method, and from following too closely old traditions which are injurious both to ourselves and to the public.

In no profession or trade is there such a leakage from bad debts and other causes as in ours. It has been calculated to amount to nearly 35 per cent. amongst general practitioners in England, which, at first sight, seems an enormous loss, but which can be easily understood. Of course, every practitioner does not lose this amount; the consulting physician or surgeon almost invariably escapes bad debts, whilst in Ireland—where, virtually, book-keeping and dispensing are unknown and cash payments almost the invariable rule—the professsion lose but little in this respect. The estimated loss applies to what should be the gross receipts for professional services rendered in the hope of payment. The work done in charity—as hospitals, gratuitous advice—would be represented by a large sum if put in a money value, but that I leave on one side as one of the necessary concomitants of our profession, one of the heirlooms handed down to us by our traditions, our customs, and by many considered as one of our privileges. We might feel satisfied with throwing in all our charitable actions to make up weight, if we received proper remuneration from those who employed us without any pretence of applying for gratuitous advice. This is a grievance not of modern times, but one which was felt by physicians and surgeons of former days, who, in their time, experienced the ingratitude of their patients in forgetting to bestow their *honoraria*. They have left us many aphorisms and apothegms illustrative of the feeling of the public towards the profession, of which the following is a specimen:—

"Three faces wears the doctor when first sought,
An angel's, a God's, the cure half wrought;
But when the patient's well, he seeks his fee,
The Devil looks less terrible than he."

These lines are a sad reflection on humanity, but I am glad to say they are only partly true. It is unfortunate that medical men have to submit to the ordinary conditions of life, that they have to live, to comply with the requirements of modern civilisation, that they have to descend to such ignoble wants as to require sustenance and food; and, in fact, to use plain words, that they have to pay for rents, rates, and taxes, for horses, carriages, and servants, for butchers, bakers, tailors, shoemakers, *et id genus omne*. They have, in vulgar parlance, to pay their way, and the money they receive in the shape of fees is not lost, but circulates freely back amongst the

inhabitants of the place where they reside and by whom they are employed. Medical men very seldom amass large fortunes as the result of their labours purely, the few exceptional cases quoted from Doctor's Commons to the contrary.

I take it that the medical profession should be guided to some extent by the rules of political economy ; labour is worth a certain value, professional services are worth a certain value, and in order that medical men should be able to pay for what they themselves require, it is necessary that others should pay them ; in fact, it is a duty they owe to themselves, their families, and even to society, to look after their accounts. Their families require providing for, and every one unfortunately knows of cases where they have been left without any provision, purely through neglect of the ordinary rules of commerce, of even prudence, and society thereby suffers, and is taxed for the support of those thus left helpless through false ideas of humanity.

I recognise the claims of humanity upon us, and would encourage feelings of charity, and of kindness to our suffering fellow creatures ; but I have no sympathy with the perversion of charity, and would confine it to its legitimate channels. Every medical man can discriminate for himself where to remit fees, and use a wise discretion thereon ; what I deprecate is, a criminal and foolish benevolence which neither benefits the profession or society.

The justice we desire for others, we ought to claim for ourselves—fair payment for services rendered. The same principle is extended to all other professions and trades, to the poet, painter, sculptor, lawyer, architect, tradesman, &c., and I can hardly be accused of inculcating wrong notions, in advising my brethren to pay more attention to their accounts, thereby avoiding the county court.

What are the causes of this leakage and loss? Does it really exist? What should be the remedy?

The causes are, as I have said, numerous ; arising from too keen competition, ambition to swell the daily list of patients, carelessness about bookkeeping, and from the habit of sending out accounts at too distant periods. Some practitioners send out their bills half-yearly, and then allow a couple of years for payment, when the services of another *bête noir* of our profession, the debt collector, have to be called into requisition. He charges a commission of 10 per cent., so that we have here at once, one source of the leakage explained ; whilst the other arises from bad debts, change of residence, and from the long period of credit given.

The actual existence of this amount of bad debts may be learned from anyone acquainted with the routine of medical practice, whilst the part played by the county court may be easily ascertained by visiting any of these halls of justice, and listening to the list of cases. The visitor will be rather astonished at the system, and probably come away with the full determination never again to enter such a place. He will hear the names of medical men called out as claimants, and they may be represented by a solicitor, debt collector, or may attend themselves personally. Generally the claims are undisputed, and there simply comes a question of how the patient can pay ; as a rule, some plea is alleged, and the judge, or registrar, makes an order for some amount per month, so that it is often years before the whole bill is cleared off. The ambitious young practitioner will feel saddened at this view of our profession, and very naturally so.

Is there any remedy for these state of things? I have said in former letters internal reform must come from ourselves, if we would really elevate ourselves, and assume our proper position ; and this can be done not only by gaining the esteem and respect of our fellow-men, by moral rectitude, by philanthropy, by charity, but also by setting more value on our time and services.

The world takes us very much at our own price ; our profession is a noble, humane, and liberal one, and if we work for nothing in an age when money is of so much importance, we cannot expect to have our services really appreciated. Many of my readers might suggest remedies, but I would myself impress upon my brother practitioners the wisdom :—

Of not being too anxious to have too many patients on their books ; they cannot attend to more than a certain number daily ; it is a waste of their health to work from morning till night, as some practitioners do for low fees ; it would be better for the public and the profession, if they restricted the number of their patients and increased their fees.

A more accurate system of book-keeping is also desirable ; and accounts should be rendered quarterly, and in many cases directly after the attendance is over. We should remember the old motto, *dum dolent accipe ;* thus we should not hear so much of disputed accounts, and patients would on the whole be more satisfied.

We want more union amongst ourselves. The Britons, we are told by Tacitus, being divided amongst themselves were more easily conquered.

Dum singuli pugnant, universi vincuntor. We should remember this fact, and that any action to be useful must be united. There are many other points I might dilate on, but must defer them to another occasion, hoping that the seed I am scattering may fall into fertile ground, and produce some good result.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
Is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
,, IF PAID IN ADVANCE 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.
A. H. JACOB, 3 Molesworth Street, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS ; Baltimore, by Messrs. KELLY and PIET ; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars ; or direct from the Offices in this country for the same amount, by International Post-office Order.

WEDNESDAY, AUGUST 1, 1877.

THE NON-ALCOHOLIC TREATMENT OF DISEASE.

ALTHOUGH the alcoholic or non-alcoholic treatment of disease, is a question which has only partially engaged the attention of the medical press, there can be no doubt of its being one of paramount importance, even when compared with others that have lately divided the opinion of the profession. The interest attached to the recent agitation on Vivisection was very great while it lasted, but it was a question that chiefly concerned the brute creation on the one hand, and physiology on the other. The great Temperance movement has likewise led to much discussion, and the best method of dealing with the habitual drunkard, the claims of total abstinence, the prevalence of secret drinking, &c., are subjects which have largely engaged the attention of medical journalists. But these are questions in which medical men and the public are, individually speaking, very little interested. The same may be said of the germ theory of disease, the Conjoint Board scheme, the progress of state medicine, and a few other subjects which, although of the greatest importance, are either of a

temporary and limited interest, or turn upon certain points in pathology, hygiene, or medical politics, which concern the welfare of the community as a whole rather than the welfare of its individual members. With regard to the question now under consideration the case is very different. The propriety or not of administering wine and other alcoholic stimulants in the treatment of disease, is a question that must have occurred a thousand times to every medical practitioner, and there is not a single member of the community, who may not at any moment be affected by the decision arrived at by the profession, or by the individual opinion of his medical attendant.

It behoves us therefore, to take great interest in the matter, and to watch very closely the evidence and the arguments that are brought forward in opposition to a practice that has prevailed from time immemorial. Let it not, however, be thought from any thing we have said, that the influence of habit and the prescription of ages have prejudiced us against the trial that is now being made of the non-alcoholic treatment of disease. On the contrary, were the medical staff of the London Temperance Hospital to establish the fact, that alcohol was perfectly useless as a therapeutic agent, they would have made one of the most remarkable discoveries of the age. To be convinced of this, it is only necessary to consider the results that would naturally flow from such a discovery. In the first place, it would eliminate from the art of healing a fallacy of the gravest importance: not merely some slight error of opinion or theory, some erroneous conception with regard to this or that obscure point in physiology or pathogeny, but a glaring fallacy in respect of a practice which has been daily adopted by the profession from the earliest period in the history of medicine. To show that medical men have in all countries and in all ages, been labouring under a delusion and that they have all along been prescribing a drug (for we may call alcohol a drug) which might as well have been thrown into the nearest gutter, as down the throats of their patients, this would be truly an accomplishment that could not fail to excite the astonishment of all those who are wedded to the medical conventionalism of the past.

Nor would the gain to the science of therapeutics be inconsiderable, for it is the province of therapeutics to show what is useless or what is injurious, no less than what is beneficial, in the treatment of disease. Besides, when it had been shown that so important and valuable a drug as alcohol was dethroned from the high place it held in the estimation of the profession, it might be very naturally asked whether many other popular and potent remedies might not, if submitted to the same searching criticism, share the same fate. For, as we have already remarked, is not alcohol a drug as much as ether or ammonia is a drug? Has it not certain characteristic and physiological actions upon the system, just as ether or ammonia has? And if, in the treatment of disease, we can wholly dispense with the former, may we not be able to do without the latter. We might thus in time purge our pharmacopœia of many useless drugs, the official recognition of which is only so much testimony to the imperfections of medicine as a science. Indeed, it is probable that in proportion as medicine becomes more exact and scientific, the number of our really valuable drugs will be greatly diminished. Nor would the step thus made towards the advancement of therapeutics and in the interests of the sick, be entirely of a negative nature, inasmuch as were the non-alcoholic treatment of disease to prove a success, the natural inference would be that the practice hitherto adopted had not only done no good, but had probably in too many instances done a great deal of harm; and the profession might, as Cardinal Manning remarked, be said to owe a large debt of reparation to society for the mistake under which they had been so long labouring.

Equally important would be the results which, from a social and economic point of view, would follow from the successful trial of this non-alcoholic system of treatment. The habits of society could not be otherwise than favourably affected by such a discovery. Little could then be said in defence of the most moderate indulgence in spirituous liquors in a state of health; and the cause of the total abstainer would be supported by one of the strongest arguments that could be advanced. And as to the economic advantages that could result from the exclusion of alcohol from the dietary of the sick, they must be quite obvious to all who know what a large item this stimulant is in the expenses of our hospitals and other charitable institutions.

It will be seen from the above remarks that we do not underrate the importance of the trial that is now being made to treat all manner of disease and accidents without the use of alcoholic stimulants; but what we would insist upon is that this trial should be a fair one, that all possible fallacies are guarded against in conducting the experiment; and that conclusions are not hastily drawn from insufficient data and erroneous premises.

First, it should be asked what is the object of all medical treatment. It is not merely to cure disease, but to shorten its duration, to prolong life, to obviate the tendency to death, to hasten convalescence, to support the strength and spirits, to relieve symptoms. If the moderate and discriminate use of alcoholic stimulants will fulfil, or assist in fulfilling any one of these intentions, we should be no more warranted in discarding them as therapeutic agents than we should be warranted in erasing from the materia medica such remedies as opium, or ether, or ammonia. It is not sufficient to show that this case of fever, or that case of pneumonia, progressed favourably and terminated in recovery without the use of any alcoholic stimulants. Were there no other fallacy in such instances in respect of any of the points above-mentioned, there would be still the objection that the conclusion sought to be drawn was only applicable to those particular cases, and that the data which have as yet been furnished, are far from being sufficient to settle the question at issue either one way or the other. The authorities at the hospital above-mentioned already appeal to their experience as a proof that there was no disease which could not be cured better without alcohol than with it; but in reply to this statement we would ask what assurances have we that this experience is perfectly reliable, and that it will not in time be shaken and controverted by the experience of others? The fallaciousness of experience in a science like

ours, has almost passed into a proverb. Reliance upon this method of finding out the truth has done more than anything else to retard the progress of medicine, and it is certainly one of the most treacherous guides we could have in threading our way through the tortuous paths of medical research. Did not, to mention one among many instances, Dr. Todd appeal to *his* experience, when in the wards of King's College Hospital he astonished his pupils by the enormous quantity of alcohol he was in the habit of prescribing? And did he not justify his practice by an array of cases that was quite as plausible as any of those which have been lately published in favour of totally withholding it? As Oesterlen justly remarks, "so long as physicians can appeal to nothing more certain in their practice, in their success or failure, than their experience at the bed-side, every new patient, every fresh experience may shake or contradict their views. They must be content to let every one else, even charlatans, appeal to *their* experience, and inasmuch as the latter can often avail themselves of the same argument, the *post hoc propter hoc*, which the physician employs for the success of his operations, viz., the recovery of his patients, the sick will necessarily place the same confidence in and award the same thanks to them as to the most able physician."

But if medical experience in the ordinary acceptation of that term, be so fallacious, what shall we say of that negative and one-sided experience which excludes one of the most important applications of the negative method of reasoning. The very principle on which the London Temperance Hospital has been established precludes the therapeutic value of alcohol being put to a fair trial. Here there is no opportunity of submitting the question at issue to that crucial form of experiment which affords the most reliable means of deciding between the claims of rival systems of treatment.

Supposing, for the sake of argument, that alcoholic stimulants were of service in some cases, there would be no opportunity of demonstrating the fact in an institution in which the use of such stimulants was rigidly excluded. It appears to us that if the experiment is to be a satisfactory one, it must be conducted on a different plan to that pursued at this hospital. The progress of those cases or those symptoms in which alcoholic stimulants are withheld should be carefully compared with the results of their administration under precisely the same circumstances. Even in the same case, the effects of the withdrawal of the stimulant may often be compared with those which follow a return to it. Valuable evidence might also be obtained by an accumulation of those "solitary instances" which come under the observation of the private practitioner. But, as a rule, it would be by comparing a large number of similar cases, or similar symptoms, treated partly with, partly without alcohol, that a correct judgment could be formed on the question at issue.

Nor must theory be entirely ignored; for the deductions to be drawn from the results of such a systematic method of experiment as that which we have faintly sketched, might be confirmed, and may be corrected, by what we truly know of the nature of the disease, or symptoms under treatment, and the physiological action of alcohol on the system.

THE MEDICAL BENEVOLENT COLLEGE AND VOTING REFORM.

A SPECIAL general meeting of the Governors of the Medical Benevolent College was held on Wednesday last, the 25th, to consider the important resolution which we published in our issue of July 11th. The Council of the College, backed by a few friends, managed to defeat the objects of the meeting, and of those Governors who believe that a great principle is involved in the question of the abolition of canvassing for votes.

It soon became manifest that a foregone conclusion had been arrived at, that a majority had already determined to keep up the present hap-hazard mode of electing candidates, and certainly it would not be far from the truth to say that the resolution, although carried by those who came to listen to a discussion of the question on its merits, was rejected by an adverse Council, bent upon resenting something like external pressure, or as it was said, "the dictation of an alien society." Indeed, had the resolution been carried by the meeting, in all probability it must have come to grief; for the chairman stated that, as it stood, it was for the Council to say whether they would give effect to it or not; as by the Charter of the College, any change in its rules must emanate from that body, and not from the Governors.

The Rev. R. J. Simpson, in a very temperate and judicious speech, proposed the first resolution, and it was seconded by Dr. Hare. The reverend gentleman stated, that he claimed to approach the Council, not with any wish to interfere with, or to touch, the internal management of the College, but simply with a view of questioning the policy of a certain mode of election to its benefits and which, in his opinion, involved principles affecting the general interests of charity, and to some extent the welfare of the community. As a member of the British public, he felt at liberty to suggest improvements in the mode of electing candidates to a public institution, where active managers, by means of the press, the pulpit, the meeting, the circular, and the pulpit, are constantly appealing far and wide for support.

No one would deny that canvassing for votes was not most objectionable in principle and practice. In principle because it inflicts upon hundreds of poor widows and other applicants, an unnecessary labour and expenditure of time and money, which they can ill enough afford; whilst it fosters a systematic habit of begging letter writing, which in the end becomes demoralising. An injury is done to the poorest, and often the most deserving candidate, for those who can afford to spend the most money, succeed, and the friendless and needy fail. This clearly should not be the case in a *public charity*. It is objectionable in practice, because it constantly withdraws poor widows from their families to go about begging for votes, and forces them to publish their misfortunes and sorrows in thousands of circulars, in the hope of attracting attention and obtaining justice; whilst friends are tempted to traffic in votes, and others offer sham help, that they may veil their object of advertising their cherry brandy.

The heavy expense entailed in printing and postages in no way benefits either the candidate or institution, and could this expenditure (which amounts to £10, £20, or

£30 in each case) be made to appear on the accounts of the charity, multiplied by the number of candidates, the monstrous absurdity of the system would be too intolerable to be borne. The Council, however, refuse to abandon the system upon other grounds ; it failed to see by what principle it can justly be made penal for a parent or guardian of the candidate to ask votes, while it is held innocent for any other person to canvass, and at the same time seize upon the opportunity of vaunting the qualities of their cherry-brandy. This can scarcely be said to be a serious objection, and it could certainly be met by enlarging the prohibition, and by making the resolution more comprehensive. This was urgently needed in the interest of the College, for year after year candidates are elected, not upon their merits and needs, but by the help of professional traffickers in votes, who are known to be ready, for a consideration, to carry the election, not of the most deserving, but of those with friends able and willing to pay the price asked. The system of canvassing for votes is now known to be hedged in by professional *jobbers* (*a*), and candidates without influential friends should be honestly told at once that they need not apply. Should, however, any be rash enough to make a fourth, fifth, or sixth venture, it is as well that their friends should reckon the cost, for they can scarcely expect to escape the "superannuation" rule, which in all likelihood will eventually bring them to grief.

To return to the resolution, the Council's strongest point made against it was, that, if adopted, it must seriously affect the funds of the College. This is putting the question on the miserable plea "that it pays," and against this the expense, time, and trouble, and misery of the candidates and their friends go for little or nothing. But even this plea will not avail with those who are acquainted with the facts. For those charities which have adopted the non-canvassing and voting system have experienced no falling off whatever, either in their funds or in "the personal interest of their subscribers." The Royal Albert Orphan Institution from the first acted upon the non-canvassing system, and having beside, made it penal to canvass, have seen no cause to complain or repent of the course taken. The Royal Naval Orphan Asylum and the National for Incurable Epileptics long ago abandoned the system of canvassing in any shape. This step was taken, the board of management tells us, "to obviate the suffering, loss of time, and money caused to the unsuccessful candidates." The managers of the British Medical Fund prominently hold forth to their subscribers the fact that "relief is dispensed on the principle that applicants are not required to attend personally, nor have they to publish to the world their distresses and sorrows, neither have they to canvass, or advertise, or issue cards and circulars." The Society for the Relief of Widows and Orphans of Medical Men administer relief to a very large number of widows and orphans annually ; and be it said to the praise of the managers, that widows are not allowed to die and disappear from the list of applicants before they obtain what they so much require to relieve their dire decessity. Poor Mrs. Sarah Young, at the age of 70, with "means almost exhausted," appealed to the Royal Medical Benevolent for the third time, having already polled 2,255 votes, got together at considerable cost, died just a week before the day of election.

It is incomprehensible enough to those who have bestowed some attention upon the question at issue, that the Council of the Medical Benevolent College should refuse a remedy for the evils complained of by upwards of 2,000 of their subscribers, and all of whom believe, with Sir William Gull, "that it would be a great gain to the cause of charity if the claims of the deserving could be satisfied better than they are at present."

(*a*) The Capel Court way in which these traffickers in votes, conduct their business, may be gathered from the following extract from a letter written by a professed broker in votes, to the friends of a candidate :—

"Incurables and Royal Medical Benevolent are at par, and votes for the Alexandra Orphanage, as a rule, are difficult to realise at their full value. I often give two for one Idiot, but when I can find out a case to work jointly with me, the result is more pleasant."

Notes on Current Topics.

Treatment of Sleeplessness.

"The Disease of Sleeplessness : its Various Causes, and certain permanent Cure, without Opiate, Doctor, or Hindrance to the ordinary Associations of Life, under a Combination of various Systems of Treatment. By a Country Clergyman, who has suffered and prevailed." Such is the title of a quaint and grandiloquent pamphlet that has just come to our notice, and which we were about to throw into our waste-paper basket along with other pamphlets of a similar nature, when it occurred to us we might make it the text of a few remarks on a symptom to the proper treatment of which the practitioner can never be indifferent. In some of his writings—we forget exactly the place—Hippocrates says we should do all we can for our patients, and not omit taking a lesson even from the quacks. We shall have the less hesitation in doing so on this occasion, as the pamphlet dwells upon the utility of a remedy which is by no means a contemptible one, and which is too much ignored by the medical profession. Our country parson is loud in the praises of *cold water*, as used externally at the hydropathic establishments, along with the strictest temperance in eating and drinking, regular hours, plenty of exercise, due regulation of the passions, &c. The cold water treatment, however, is the main thing. "There is no other remedy by which we may hope without danger to bring back sleep to the wakeful invalid." It consists chiefly of a "wash-down nearly every morning in the week, a pack twice a week, a sitz bath at night three times a week, and a wet compress to the stomach (along with the rub-down in the morning and sitz at night) once a week. All these baths are to be given in the manner adopted by the hydropathists, as much depends upon the bathing being practised in a systematic manner. The only medicines of which favourable mention is made, are bromide of potassium and charcoal—the latter to keep up a "good digestion and correct the liver." All other medicines are thrown to one side. In derangements of the liver, which are doubtless a frequent cause of sleeplessness, the hydropathists use what is called a *compress* round the stomach. This is a cloth about half a yard wide, wrung out of cold

water and put inside a cover of oiled silk, &c., to protect the clothing. It is put round the stomach in the morning and taken off at night. This remedy, in conjunction with regular exercise, early rising, and a regulated diet, is said to be very effectual in the treatment of torpor and congestion of the liver. In some cases it is continued without intermission, so as to produce what the hydropathists call a *crisis*, that is eruptive spots and small pustules, producing much itching, and often small sores. It is to be regretted that, for the most part, we leave in the hands of the hydropathist a remedy which we might turn to much better account than we do. That, however, the prejudices against the occasional and discriminate use of their treatment are not so strong as they were must be evident to any one who is familiar with the medical literature of the day. Who would have thought twenty years ago of recommending wet compress, the wet sheet, Turkish baths, &c.? Now, the therapeutic employment of these agents is often resorted to by the most eminent medical authorities both of this country and on the Continent. Only a few weeks ago, Dr. Gairdner mentioned at a meeting of a medical society that he had found packing with the wet sheet a very valuable remedy in the treatment of scarlatinal dropsy. Of course, we only speak of hydropathic treatment as being applicable to some cases of this or any other affection, and only as an adjuvant to other remedies, medicinal or otherwise, which the nature of the case may suggest. With regard to sleeplessness, there are so many morbid states of the system, and so many functional and organic diseases which may give rise to it, that it is evident rational medicine cannot lay down a hard and fast line of treatment applicable to all cases. We cannot now enter further into this subject, but they who would read an interesting account of the pathology and rational treatment of sleeplessness had better consult the admirable chapter on this affection in the second volume of Graves's "Clinical Medicine," and also the article on "Sleep and Sleeplessness" in Copland's "Dictionary of Practical Medicine."

Administration of Medicines in Large Doses.

THERE is not, we believe, a truer axiom in therapeutics than that our failures in the treatment of disease are often owing to the smallness of the dose administered. We have even seen a young and timid practitioner lose his patient through prescribing for a severe spasmodic complaint doses of medicine wholly inadequate to relieve the sufferings for which his services were required; and a very good monograph might be written on the efficacy of large doses in the treatment of disease. Nor are we merely referring to the milder and less active kinds of drugs, but even to those that are classed among our most powerful poisons. The large doses of opium that are often indicated in the treatment of some forms of mania, delirium tremens, colic, neuralgia, hæmorrhage, &c., are well known. Drs. Elliotson and Pereira treated gastrodynia very successfully with hydrocyanic acid, but they gave it in much larger doses than we are now in the habit of doing. Dr. Ringer remarks in his work "On Therapeutics" that the reason why so many find the lobelia inflata of little use in the treatment of asthma is, because they are afraid of giving it in such large doses as will produce a decided effect upon the system. And who has not heard of the extraordinary cures of sciatica and other neuralgic affections by the administration of large doses of the hydrated peroxide of iron.

These reflections were suggested on reading some remarks that Surgeon-General Francis recently made in one of our contemporaries on the treatment of refractory cases of neuralgia not dependent on organic disease or injury. In these cases, he said, we are frequently told that everything has been unavailingly tried, and that the sufferer, tired out at last, has decided on going abroad. On inquiring into the extent to which the anti-periodic remedies—notably quinine and arsenic—have been pushed, it will be generally found that the doses were considerably less than he has been in the habit of prescribing with almost unvarying success. During a residence of several years in India he has frequently given, in suitable cases, from ten to twenty and even thirty grains of quinine; and where this has been ineffectual, from twenty to thirty minims of Fowler's solution of arsenic have succeeded in staving off the attack. The habit once broken through, smaller quantities of either drug will be sufficient, but the remedy must be continued for a few days. In some instances quinine and Fowler's solution together (from six to ten grains of the former, and ten to fifteen minims of the latter) will produce the desired effect, which neither would have produced singly. Dr. Francis also recommends hypodermic injection with the neutral sulphate of quinine, as a fourth only of the quantity need be used, and the result would be secured more speedily.

The Metropolitan Hospital Sunday Fund.

THE aggregate collection of the Hospital Sunday Fund in London shows this year a considerable falling off, a result which is the reverse of encouraging to those gentlemen who have worked, year by year, so hard for its success. The miserable sum of £24,960 represents the combined enthusiasm of all religious sects for the hospitals and dispensaries of the largest and richest city in the world in 1877. We are ashamed to place such a result on record. When Birmingham, with less than one-twelfth of its population, can give half this sum for the same objects, what *ought* London to do? We are sorry to say the result is a mere parody of an answer.

A meeting of the Council of the Fund is announced for to-morrow, to sanction the award made by the Distribution Committee of a bulk sum of £24,000, as follows: to seventy-six hospitals, including four institutions classed as hospitals, £22,747; to forty-three dispensaries, including four provident, £2,223. The hospitals which take the largest share are, as usual, the London, St. George's, Middlesex, and King's College; but nearly all the awards are slightly below those of last year, in consequence of an increasing number of applications to participate and the decrease in this year's collections.

The Distribution Committee have, it appears, been applied to again this year by a society established to supply trusses and surgical appliances, and have also had the sum of £5 sent especially for the Surgical Aid Society; but they have not found it within the limit of their instructions to entertain the claim, and have, therefore, returned the contribution to the donor. The Com-

mittee also had to issue invitations to the committees of ten hospitals, to meet them, so as to afford opportunities of explaining and clearing up points which have influenced a reduction in or a withholding of any award.

Coroners.

The Social Science Association have lately memorialised the Home Secretary, on the necessity for reform of the office of coroner. They placed in his hand the following resolutions :—

1. That in the opinion of this Council a Parliamentary inquiry into the mode of appointment, the office, duties, and jurisdiction of coroners is imperatively demanded.
2. The Council draw attention to the fact that the office of coroner is one of high antiquity and high utility ; that it has been the subject of much and intricate legislation, and has come, in process of time, to be attended with inconveniences in respect of the constituencies by which the coroner is elected, the manner of election, the mode of administration and procedure, the place for holding the court, as well as many points relating to functions, procedure, and responsibility. The Council are of opinion that, in consequence of various social changes since the time of the original creation of the coroner's office, the expediency of obtaining a coroner's jury, either at all or in its present form, the existing relations of the coroner to the justices of the peace, the provision for the use of expert witnesses, have become matters requiring fresh and special arrangement.
3. That the question of inquiry into the causes of fires is one of urgency, and should be considered in regard to the appointment, duties, and functions of coroners."

A more necessary piece of domestic legislation than a Coroners' Reform Bill could not occupy the attention of Government ; but then, unhappily, it *is* a domestic matter, and as such shares the universal neglect of Parliament with other equally important matters. When we see the strongest Government which has ruled for half a century sacrificing its Bills by the half-dozen as the last days of the session approach, we have little hope of the musty and creaking machinery of coroners' inquests being overhauled.

Arsenical Poisoning by Wall Papers.

The following form of letter has been addressed by an eminent civil engineer, Mr. H. Carr, to some of the leading medical men in London :—

"It is an admitted fact that serious illness and extensive deterioration of the public health arises from the use of arsenic in the manufacture of wall papers, and of fabrics for dress and furniture ; moreover it is a subject felt and spoken of strongly by a large section of the medical profession. The injurious effect of arsenic thus used, has, however, not yet been appreciated by the public in a manner calculated to put a check upon the sale of an article which is cheap, attractive, and profitable to the manufacturer, though at the same time highly injurious to health. The letter of Dr. Owen Rees in the *Times* of 16th June, having again roused the question of the desirability of some public movement, it is proposed to communicate with some of the leading medical men and chemists in London. If their approval be given and their advice be to proceed, then to prepare a memorial to Government, or a petition to Parliament for a committee of investigation. A copy of the memorial or petition to be sent to every medical man in the kingdom, with a form of reply on which his adhesion to or disapproval of the movement may be stated.

"A short pamphlet carefully revised by medical men who have paid attention to the subject should accompany the circular.

"A question thus brought under the notice of every medical man in the kingdom, will undoubtedly arouse public attention, and will inevitably be discussed in the papers.

"It would of course be essential in the first instance that the movement should be backed by names of authority.

"Your reply to this communication in the first instance, will be considered as private and confidential, and nothing will be published or made use of without permission : but what is desired is authority to append your name as approving of the movement.

"A further communication will be made to all who reply in favour of proceeding, giving the names of those assenting or proposing a further step, suggestions for which will in all probability be gathered from the answers received."

We commend this question, which is one of considerable importance, to the notice of our readers.

The Colorado Beetle.

A good deal of anxiety seems to prevail with regard to a visitation of the colorado beetle to this country ; and it has been notified that the Post-Office regulations prohibiting the transmission of "live animals" through the post is continually broken by collectors of entomological specimens. The risk of the importation of the insect in this way is certainly very great ; and with a total disregard of the dangers incurred, a certain Mr. Leonard Snowie, of Texas, sent over to a Manchester friend a number of live beetles, which were placed in an open garden, simply to experiment alive with, try different kinds of feeding, and ascertain, if possible, the peculiar kind of diet they most prefer. This, should the beetles escape, is exposing the surrounding district to the peculiar danger of a devastating destroyer ; and neither of these enthusiasts in natural history studies would seem to be aware of the fact that the Colorado pest is furnished, like other members of its species, with powerful wings and legs, and by means of which it can easily escape from even a high-walled garden. We refer our readers to an excellent drawing and description of this potato pest that appeared in the *Illustrated London News* of the 7th July.

A meeting of the York Chamber of Agriculture was held on Saturday last, at which resolutions were passed thanking the Privy Council for the prompt steps taken to prevent the introduction of this insect into the country, and expressing regret that naturalists should be importing live specimens. It is computed that the last attack on the potato crops cost the country £50,000,000.

Metropolitan Improvements.

In the public interest it is well that it should be known who stops the way towards metropolitan improvements. When it was decided to undertake, at the ratepayers' expense, that greatest of all modern London improvements—the Embankment—a noble duke stepped in to stop the way ; consequently, the work was delayed until a compromise could be effected with a nobleman, whose sole claim to consideration consisted in being the owner of a most insanitary and offensive mud bank, which bordered his bit of pleasure ground or garden ; and

during the summer months not only endangered the health of his household but of the whole neighbourhood. The Metropolitan Board of Works were compelled to pay his Grace of Buccleuch £5,000, by way of compensation, for effecting an improvement on his property, before they were permitted to proceed with a grand work of improvement, so much needed at the time by the overgrown population of the metropolis. A nobleman once more bars the way to what is acknowledged to be a much-needed street improvement. The want of an open street leading from Tottenham Court Road to the Strand has long been felt by all classes, and the Metropolitan Board had undertaken to commence the work so soon as Parliamentary powers could be obtained; but we now learn that the Board have been obliged to withdraw their bill, which was down for a second reading, and abandon the work, because, forsooth, the Marquis of Salisbury has put in an unreasonable claim for compensation. A small portion of the proposed new street, it appears, runs through some miserable piece of his property.

Medical Degrees for Women.

In compliance with requisitions of members of convocation a meeting was held last week at the University of London, to consider the recent action of the Senate in adopting Mr. Russell Gurney's Permissive Act for conferring medical degrees on women. The chair was taken by Dr. Wood. The Clerk read the following opinion of Sir John Holker and Sir Hardinge Giffard on the case submitted to them:—"We do not find in clause 21 of the charter any power given to Convocation to interfere in any way with the powers given to the Senate of conferring degrees in medicine, and we therefore think it will be competent to the Senate to grant degrees to women without the concurrence of Convocation." Dr. Tilbury Fox moved a resolution to the effect that the house regretted that the Senate had, by adopting a permissive Act of Parliament, without reference to, or consultation with, Convocation, materially altered the constitution of the University, and had thus practically superseded the privileges of Convocation. Dr. J. Curnow seconded the motion. After a long discussion a division was taken, the numbers being for the motion, 114; against, 71. Dr. Curnow moved that it be referred to the annual committee to ask the Senate not to take any further action under the Act of the 39th and 40th Vict., chap. 41. The motion was carried by a majority of 88 to 52, and the meeting terminated.

The Inauguration of the New Hotel Dieu.

On the 1st of September next, a part of the new Hôtel Dieu is to open its doors to the sick. The architect has received orders to finish off, before that date, accommodation for 200 beds, and the 200 invalids who now occupy the old building will then emigrate thence to their new place. The greatest difficulty, however, is the furnishing of the wards for so great a number of beds, and in so short a time. Two hundred sick carry with them the whole battalion of doctors, dressers, dispensers, cooks, and ward-men, in fact, the whole community, excepting the financial department. The accommodation for the medicines, and the bed-linen, the baths, douche and vapour, the operating theatre, and the chapel, all demand special arrangements for their installation, not to speak of the kitchens, which are to be heated by steam, and can hardly be ready by the 1st of September. Many of the details of the partially-finished courts are admirable, amongst the rest the trees already planted, and the green sward enlivening to some extent this future habitation of pain. It is also interesting to observe that the flooring of the waiting-rooms, where candidates for admission assemble, are inlaid with wood, a realcomfort for the sick, who will no longer be obliged, when waiting their turn, to stand with chilled feet upon the flags and marble flooring which exist in some hospitals.

Army Medical Organisation in France.

By a recent law of the French Assembly, dated 7th July, a complete change has been inaugurated in the hospital system of the French army. Each corps d'armée in the provinces will retain in the chief town a military hospital, with an establishment destined for the special instruction of the *personnel*, and the preparation and maintenance of the necessary material of the hospital service of a corps d'armée in case of its being mobilised. Except in their head-quarter corps hospitals, the permanent military hospitals of Paris and Lyons, and the hot baths, the sick of the army will be treated in special wards in the civil hospitals in charge of military surgeons when the effective of a garrison numbers 1,000 men, should the military medical *personnel* permit. In case of insufficiency in this respect the military wards would be in charge of civil surgeons. In the French army the medical officers are divided into two sections, the one attached to regiments, the other to stationary hospitals. The latter will be solely effected by the new decree. The hospital system of the French army has from time to time undergone frequent changes. Sully established the first *ambulant* hospital at the seige of Amiens in 1597, under Henry IV.; Pignewl the first stationary hospital under Louis XIII., in 1630. In 1788 the general military hospitals were suppressed, and not re-established until 1792, since which date the regimental infirmary occupied an altogether secondary place. Both establishments were separate from and independent of the *ambulances* organised for, and specially intended to work with divisions and corps of an army on active service.

The New Parisian Pharmacy Schools.

There are in course of construction at this moment on the great unoccupied spaces of the Luxembourg Gardens, the new upper school of pharmacy. The building will occupy an extent of 17,000 square metres, a superficies about the same as half the Place de la Concorde. The principal buildings will be faced by a grand court, fifty-seven metres long, in which will stand the statues of Parmentier and Vauquelin. The lecture-room will afford accommodation for 600 students, who will be provided with laboratories in a building 80 metres in length, which is to face the Luxembourg. The whole building will rest upon the catacombs, and it is not expected that it can be completed sooner than 1880.

The Results of Legislation by Agitation.

An illustration of the mischief which may be done by the meddlesomeness of amateur legislators was brought to light last week on the occasion of an inquest held by Dr. Hardwicke at Islington. A child, the illegitimate offspring of a servant girl, had been done to death by the neglect of the old woman baby-farmer to whom it was confided, and who was able to continue her ill-treatment and starvation to the end, because the Infant Life Protection Bill does not require a farmed baby to be registered unless more than one is kept by the same farmer. The Bill, as it originally stood, would have protected the life of the infant, but a knot of fussy women, who called themselves "The Women's Vigilance Society," interfered, and exercised sufficient influence to alter the measure. Government certainly owe it to the public not to yield to the unreasoning representations of such persons, and we hope this case will be a lesson to them to set their faces against the women who have devoted themselves to the advocacy of free trade in syphilis under the name of the Anti-Contagious Diseases Act Society.

International Congress of Hygiene, 1878.

The Society of State Medicine and Hygiene is forming a programme for an International Congress during the Paris Exhibition of 1878; and we congratulate our French *confrères* on the very excellent idea of seizing the opportunity afforded by the attraction of the national industries of France for this international union of hygienists.

We may predict a very great success for this new project. The subject of hygiene is, at the present time, one of the most important and most interesting; and though France surpasses us in the number of her treatises on hygiene and on the importance assigned to the subject in her schools of medicine, yet we must claim a greater practical appreciation of sanitary laws, as evidenced in our domestic life, in the arrangements of our closets and other necessary adjuncts to comfort and cleanliness. We may learn from one another, and as science should know nothing of jealousy or nationality, we hope this congress will be productive of international benefit.

Ship Surgeons.

Within the last two years a good deal of controversy has existed in reference to the system of ship surgeons now existing. A return was called for in Parliament, which proved that a great number of ships were surgeoned by chronic medical students, who had neither qualification nor the brains or steadiness to gain one. The dangers of so scandalous a system are aptly illustrated in the prosecution last week of a shipowner in Liverpool for having sent his ship to sea without a medical officer. The vessel was a large one and bound to Bombay, and on the journey took up at Jeddah no less than 636 pilgrims, who, bringing with them their primitive dirt, imported also disease, of which many of them died. The owner was let off with a nominal fine for two curious reasons: firstly, because he had not troubled himself to learn, and did not know, the law on the subject; and secondly, because proof was given that "*it was quite unusual for pilgrim ships to carry a surgeon.*"

And still they Come!

Another Female Doctor! We use the term *female* without any disrespect to the *weaker* sex, as we once supposed they were; but, like many other old beliefs and traditions, this term can hardly now be applied, if we believe the champions and championesses of women's rights, who maintain that women are quite capable of competing with men in the struggle for existence. Madlle. Catherine Goutcharoff last week maintained, with success, a thesis for the doctorate of medicine, Paris, taking for her subject, "The Study of Uterine Flexions, in a Therapeutical Point of View." The subject is certainly one within the province of women, but it remains for experience to establish whether women will be able to drive their male opponents out of the field.

Application of Nitric Acid to the Internal Surface of the Womb.

Valuable confirmatory evidence of the value of the above practice was borne by Dr. Alloway Campbell, and Reddy, at a meeting of the Montreal Medico-Chirurgical Society. But two cases fell under the notice of these gentlemen in which the use of this remedy was followed by any bad result. On the other hand, where benefit was experienced, it was immediate and permanent, and that too, in cases where the application of iodine and various other plans of treatment had failed completely to effect any good result.

An interesting discussion ensued as to the general safety of this method of treatment. The general opinion was, that it should be used with great caution, and not heroically; and that, whilst it was in itself a very valuable therapeutical resource in the treatment of suitable uterine affections, yet Dr. L. Atthill was not justified in recommending its being used as generally, and as boldly as he does.

An Irish Poor-law Medical Officer's Residence.

At the last meeting of a West of Ireland board of guardians, the dispensary doctor made an eloquent appeal to them by letter for a residence, or, as an alternative, for leave to live outside his district. He thus describes his residence:—

"The only place available in this locality is a miserable little licensed whisky house, where I am obliged to put up. This little house has but one entrance from the street into a small kitchen, which is the tap-room also, and through which I must pass to get to my little wretched apartment, and that in the middle of a scene of drunken revelling, and still more, I am only separated from this revelling by a common little door and sort of partition.

"Then what I call my sitting room off this kitchen-dramshop is 10 ft. 3 in. broad, 13 ft. 6 in. long, and 6½ ft. high; while my bed-room, which opens into it, is 6 ft. 9 in. broad, 13 ft. 6 in. long, and 6½ ft. high. Such is my present position."

Case of Hydrophobia during Pregnancy.

At the meeting of the Academy of Medicine of Paris, June 26th, 1877, Professor Borley communicated (in the name of M. Couzier, of Bagnières) a very curious case.

A woman, æt. 42, pregnant seven months and a-half, was bitten on the hand in February last by a cat. On the 25th March she was confined without accident, after having lost every recollection of the wound, to which she attached no importance. On May 6th—ninety days after the bite—the lochial discharge became suffused, and on the 9th of May, during the night, she developed the most frightful and confirmed symptoms of hydrophobia, dying on the 11th, in spite of all treatment.

The child, up to the 15th June, has been quite well, and another child, bitten at the same time as the mother, has not experienced any bad effects.

The Provident Dispensary Movement.

We announced in our last that a meeting was contemplated for the purpose of consolidating existing dispensaries and bringing them into more direct communication with the various London hospitals. At the invitation of the Charity Organisation Society, a conference was held on Saturday last in the rooms of the Medical Society of London at which representatives of the provident dispensaries in the metropolis were present. Mr. Timothy Holmes, F.R.C.S., occupied the chair, and the following points were submitted for discussion:—1st. What steps should be taken to increase the number of efficient provident dispensaries in London. 2nd. What should be the relations of the provident dispensaries to the hospitals. 3rd. Was it possible to secure a correspondence between the different provident dispensaries in London, so that a member of a provident dispensary, when he removes to another district can, without delay and without entrance fee, immediately obtain medical relief in the provident dispensary nearest his new residence.

Dr. Ford Anderson opened the discussion by reading a paper on the progress made in extending provident dispensaries in London. He said in Manchester the trial of the provident dispensary had been made very fully. The seven dispensaries had 13,769 members, and an income of £2,680, and the decrease in patients in the various hospitals was equal to 41 per cent. In one hospital where no inquiry was made the number of patients had risen 61 per cent., in London the number of dispensaries had risen from 13 in 1870 to 28 in the present year. These were chiefly in the suburbs. With respect to what steps should be taken to increase the number of efficient provident dispensaries in London, he thought the task should be entrusted to the medical committee of the Society for Organising Charitable Relief, which would form the nucleus of the new society. These dispensaries should be supported by the local residents, and it would be desirable if the present local benefit societies were transferred to the dispensary. With respect to the correspondence between the different provident dispensaries, if a union existed any member could be transferred from one to the other, and he did not see why a person from one town should not be transferred from the dispensary in a given place to that in another.

Sir Charles Trevelyan said in London there had grown up a great many spurious imitations, which were conducted by unqualified men, whilst, on the other hand, some had been started simply for the purpose of getting as many subscriptions as possible. One especially was an institution in the city which was just formed, and this proposed to have governors' cards; and whilst the poor had the opportunity of paying or not paying, as a matter of course they would not pay, but would go touting for these governors' cards.

Dr. Joseph Rogers, Dr. Stewart, Dr. Nankevill, and others also addressed the meeting, and after various suggestions upon ways and means, resolutions in favour of the objects of the conference were adopted, and the proceedings terminated.

Governmental Regulation of Prostitution.

Geneva has been selected as the town in which the first International Congress of the British, Continental, and General Federation for the Abolition of Governmental Regulation of Prostitution is to be held. The Congress will assemble on September 17th, and continue its sittings during the five following days. As the International Congress of Medical Science is arranged for the previous week at the same place, it has been suggesed that the success of the two would militate the one against the other. This, however, need not be feared, as representatives of or delegates to the one would not be likely to attend the other in case; nor will the profession attach much importance to the second Congress, whose object is set forth to be "to contend against the social evil of prostitution, especially under the forms in which it presents itself as a legal or officially tolerated institution." This matter has already been so thoroughly argued, and the evidence adduced of so conclusive a character, that European Governments are not likely to alter their views, nor to substitute laws in accordance with the opinions of the *soi-disant* "Federation for the Abolition of Governmental Regulation of Prostitution."

Palliative Measures against Writers' Cramp.

M. Dally has employed with success on a patient suffering from this troublesome affection "Esmarch's bandage." He applies it to the forearm, and says he thus furnishes a point of support to the muscles, and prevents them from contracting.

M. Paul, for the same purpose, fixes in the ball of the hand a ball of caoutchouc, and thus the patient can easily write. These remedies seem simple, and their value may be easily tested.

Utilisation of the Morgue for Medico-Legal Conferences.

We learn, from good authority, that the Minister of Public Instruction has complied with the request of M. Vulpian, and that the unfortunate victims, either of crime or passion, are to be utilised for the advancement of medical jurisprudence. Medico-legal conferences will take place twice a week, from the 1st of November up to April, open to doctors of medicine and students who have completed three years' study.

A Remarkable Deformity of the Teeth.

A Russian traveller, M. Miklucho-Maclay, during his travels in Melanesia observed among the natives of the Admiralty and Hermit Islands a remarkable peculiarity of the teeth of the upper jaw. The incisors project "shovel-like" almost horizontally, and to such an extent

as to extend beyond the lips when the mouth is closed. The breadth of the teeth is so great as to equal their visible length, being as much as 19 millimetres to 16 millimetres of length, measured from the edge of the jaws. As all the teeth have a blackish polish, owing to the prevaling habit of betel-nut chewing. The mouth has anything but a pleasant appearance.

Mr. Isaac, who seems to be one of the hopeful type of legislators, has introduced a Bill to amend the Sale of Food and Drugs Act (1875) which was read a first time on Wednesday last. No doubt his intention is to bring it under the discussion of the trade during the recess. No one yet knows what its provisions are.

With the exception of Bombay, the mortality of Berlin is at the present time the highest of any city in the world, from whence returns are furnished to the Registrar-General. Whilst the death-rate of London is only 21, Berlin has the terrible figure of 55 per 1,000 against it.

Mr. Justice Lush, in charging the grand jury at York Assizes last week, spoke strongly against the present system of coroners' commitments, which he hoped would be altered when the Government found time to take up the coroners question.

The death-rate in the four principal cities of the United Kingdom last week was—Edinburgh, 17; London, 21; Glasgow, 24; Dublin, 25 per 1,000 of the population. In the second category, Portsmouth was lowest with 16, Oldham highest with 31 per 1,000 of the population.

Mr. W. J. Smyly, M.D. Dub., F.R.C.S.I., Demonstrator of Anatomy in the Royal College of Surgeons in Ireland, and brother to Mr. Smyly, Vice-President of the College, has been appointed Assistant-Physician to the Rotundo Hospital, in the room of Dr. Purefoy resigned.

Correspondence.

PROFESSIONAL SHODDYISM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Thomas Carlyle characteristically affirms that this part of the advanced nineteenth century is full of "shoddies and shams," which language, I suspect, is not a whit too strong, nor is it a mere hyperbole, for truly at the present time "shoddies and shams" are most prevalent, even in the medical profession. But what is truly surprising and humiliating, is that medical men should patronise the first of these two Brummagen honours, and that they should attach to their names certain unavoidable appointments, which are disfiguring rather than ornamental.

With your permission, I will merely refer to the *shoddies*, and leave the *shams* (for I must observe that we have not quite descended to them yet), to Spiritualists, and those empirics who cure diseases with globules.

The editors of the *Medical Directory*, published by Messrs. Churchill, doubtless will be rather surprised, and my readers I dare say will be as much so, when I assert that these gentlemen indirectly encourage and promote these shoddies, unwittingly, I believe, but nevertheless effectively.

Now if my readers will just take the trouble to look through only a few pages of the *Medical Directory*, they will there discover *shoddies* by the dozen. This is no exaggeration, as the quotations I shall make from the said bulky volume will prove: so for their edification I will make four extracts. Of course the names of those gentlemen who are proud of holding such *important* appointments, will be omitted.

——, Surg.: A.O.F., Odd Fellows, and various Benefit Societies, Sons of Temperance.

——, Medical Att. to various Benefit Societies, Druids, and Britons. *Royal Liver.*

——, Surg to various Clubs, Free Gardeners, and Odd Fellows, &c., &c.

——, Med. Off. several Friendly Soc. Med. Ref. Hearts of Oak Benefit Soc., &c.

There are many others with local names which are omitted, and which are too numerous to mention; but the above examples are quite sufficient to demonstrate to my readers what I mean by professional shoddyism.

The local Clubs and Benefit Societies sometimes contain no more than nine members, and many do not reach beyond twenty. Now for medical men to insert these paltry appointments, so-called, after their names in an official Directory as something to be proud of, is to me altogether inexplicable. Being obliged to attend clubs is in itself humbling, and something derogatory to a professional man; but to make it known and promulgate it to the world at large, is nothing else but professional shoddyism.

Were I a medical attendant to the A.O.F., or other clubs, I certainly should be under the impression that it was a necessary indignity, and should be inclined to keep such Brummagen appointments *sub rosa* not a matter to be proud of, or sufficiently important to insert in the Medical Directory.

Now if the editors of the above-mentioned Directory sincerely wish to decrease its bulkiness, according to their annual intimation, the best thing they can do is to abstract these *appointments*. By so doing, most probably it would be a hundred pages less, and they would also wash their hands as regards abetting and encouraging such egregious folly. They will then be able to insert past Union appointments, which are of considerably more importance to the profession and the public, than these clubs, which, in my opinion, are a frequent source of ruin to both town and country practises, besides being a stigma to the profession.

Yours faithfully,

Junius Medicus.

SOCIAL STATUS OF THE PROFESSION IN IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—Do you not think that we might find some other cause which induces the small farmer and petty shopkeeper to send their sons to the profession than that of cheap universities and low-class medical education. It is seldom that such men as these could compete with educated gentlemen in public or private practice, and it would not pay unless they were pretty sure of getting something to do as soon as qualified.

These are the gentlemen who are now almost invariably selected by the Poor-law guardians in Ireland, to fill their unions, dispensaries, &c., no matter how superior may be the qualifications or capabilities of other candidates. Why they are selected, the following quotation from a letter at present in my desk may explain:—

"There are six already in the field, two of whom are of a certain religion, and either of those we are determined to appoint, and *who so fit*, as those of the same religion they will be among; so don't come unless you are *specially* qualified, but, do as you like, no horse can win that is not entered. I enclose list of committee, salary, £120, with registration, vaccination, and £15 Public Health Act; there is also a handsome salary which goes with this dispensary from a local appointment.

"Your obedient servant,

"X. Y., Hon. Sec."

The above was in answer to a question from me asking of a friend of mine, who had ten years' service as M.O., and highest testimonials from his committee, also from Protestant rector, and parish priest, would have any chance at the coming election of M. O. for that district. The local appointment here was not connected with any particular form of religion

Added to the Poor-law salary, the appointment was worth about £250, not including constabulary attendance. It seems it would be much more suitable that such appointments should be open to competition, as in the Army Medical Department, &c., and not left to the *gift* or decision of a committee, most of whom are generally of the same rank as the man approved of by them, and some scarcely with penmanship sufficient to write a red ticket. In my late district the farmer generally left a lot signed, and his little daughter, who was the "illigant scholar intirely" filled them up.

I am Sir, truly yours,

AN EXILE OF ERIN.

Cheshire, 21st July, 1877.

[The system to which our correspondent refers is truly deplorable, and there is every fear of its being developed into a greater abuse, if that be possible, than it is. At a recent election for a dispensary in the west, one of the candidates put the screw upon the electors by publishing in the local newspapers a letter from the bishop of his own religion, who could of course know nothing whatever of his professional capacity, but who commended his appointment on the ground that he was "one of the right sort." We are glad to say that he was beaten—we shall always be glad when anyone who resorts to these tactics fail; and we hope that, before many years, the scandalous abuse of the system which is now in operation of electing a religionist, *not* a doctor, will compel Parliament to take the selection out of the hands of guardians and committeemen, and place it under the control of persons who seek only for the most competent medical men. We do not, however, see that these abuses have much to say to the status of the profession, on which we commented.—Ed. M. P. & C.]

"THE FRUITS OF PHILOSOPHY."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am terribly puzzled to understand how it is that such eminent members of our profession as, for instance, Mr. Erichsen, Sir H. Thompson, Dr. Hardwicke, Dr. Morell Mackenzie, and Dr. Palfrey, together with the greatest British philosopher of the day, Professor Alexander Bain, of Aberdeen, with his eminent pupil Prof. Hunter, and Prof. Sheldon Amos, can all be of the opinion that our deceased brother in medicine, Dr. Charles Knowlton's "Fruits of Philosophy" is an innocent, nay praiseworthy book, written by a good man and a clever physician, for a very laudable purpose, whilst I find yourself, Mr. Berkeley Hill, and other no less able men so bitter against it. For my part, I hold that all earnest works, like that under discussion, when written by medical brethren, should at least be read with great care and respect, and that it is the duty of all good and true physicians and practitioners of the healing art to listen charitably to all that is put forward gravely and sincerely by one of our fraternity, however humble.

Dr. O'Flanagan, of Houghton-le-Spring, Durham, writes a letter in your issue of July 18th, which, in my opinion, quite bristles with errors. In the first place he occupies three paragraphs of it with some theological remarks directed *in toto* against the theory called Malthus' Law of Population. It will be sufficient, I think, for your candid readers if I remind them that the Rev. Mr. Malthus, who wrote his immortal essay in 1798, and who proved incontestibly that there is a constant tendency in population to increase faster than the means of subsistence, was a divine, as were also his disciples, the Rev. Dr. Chalmers, of Scotland, and Archbishop Whately, both ardent Malthusians in their day. This surely shows that the notion of restraining population may be held by the most pious persons.

In the fourth paragraph of Dr. O'Flanaghan's letter he alleges that Knowlton's pamphlet aims at "the entire suppression of the race." Has the writer veritably read Dr. C. Knowlton's innocent little work, and if so, how can he, in the name of all that is wonderful, so misrepresent it? Dr. Knowlton merely says that marriage is desirable in *early* life in order to prevent men taking to prostitution and masturbation, and becoming insane, &c.; and in order to make early marriage feasible, he recommends all young married people to limit their families voluntarily in the way done at present so universally in France. What purpose can there possibly be attained to by Dr. O'Flanaghan in asserting that this would lead to the *suppression of the race, à la* Schopenhauer, of Frankfort, the pessimist German philosopher of latter days.

In paragraphs 6 and 7 Dr. O'Flanagan at last comes to something like an utilitarian or scientific argument against Knowlton's plan for getting rid of surplus infantile deaths by putting an end to the main cause of of all our social miseries, chronic poverty. He says, what is quite true, that some modern French philosophers and writers on social science, with some notable exceptions, such as Joseph Garnier, Bertillon, &c., have of late years taken quite a scare at the very slow increase of the population of France, as compared with that of Germany. In travelling in France I have often laughed heartily at the way in which some elderly gentleman will lament that his neighbours are so terribly *prudent* in not having a large family, and that France is not increasing so rapidly as Russia or Germany. On interrogating such a person I have, almost without exception, found that the supposed virtue he praised in his neighbour's case was one which he had never practised himself, having, *of course*, had only the eternal two, or at most three, of the French family. And I have often felt constrained to point out to such a gentleman that in this case what is good for the individual is good for the nation, and that the *sine quâ non* of a happy state of an European society is that it should increase *as slowly as possible;* because only in this manner, in Europe, can any nation have a low death-rate. Every tyro in political economy knows what Dr. Letheby used to insist on so well —that a high birth-rate involves a high death-rate in all European States.

It is curious that the last word on this all important-question has been recently written by our most eminent *confrère*, M. Bertillon, professor of the Ecôle de Medicine, of Paris, in the *Révue Scientifique*, for February, 1877. Dr. Bertillon takes quite the opposite view as to the effect of the small-family system in France, from what is usually put forward by non-scientific writers in our *Times* newspaper. Bertillon shows that at this moment there are in France 26 births for every living 1,000 inhabitants, whereas in England there are 35, and in Germany 39 births, *i.e.*, nearly three children are born in Germany to two in France. Bertillon shows further that this is not due to the scarcity of marriages, for there are in France 140 married women between 15 and 50, whereas there are only 133 in England, and 128 in Prussia. Germany is consequently a far poorer country than France; and indeed health in France has been increasing, whilst the ratio of children to a family has been falling off. M. Bertillon further shows, what was well and clearly shown by Mr. J. S. Mill, that in the departments of France where there are the greatest numbers of peasant proprietors, families are smallest. Block, in his *Statistique de la France*, tells us that in such districts the peasantry and artisans habitually limit their families to two children. Thus in the 30 departments with the greatest numbers of such proprietors, the births are only 24·7 per 1,000 inhabitants.

Well, from all this, Bertillon draws the conclusion that this French system, instead of rendering the nation less apt for warfare, makes it far more powerful in time of war. He estimates that the maintenance of any child from birth to the adult age, costs some three or four thousand francs (£160), and that if Germany had the French birth-rate, the births in her state would only be 1,040,000, instead of 1,600,000 every year, as it is now. Consequently Germany has, he truly says, to expend 56,000,000 francs yearly on the increase of her population beyond what France, with equal population, would require. Thus, the greater part of the excess of production over consumption, is, in Germany, devoted to the augmented population, whereas in France, it goes to swell the capital and wealth of the country; and thus, to render it more powerful both in war and in peace, because the population is better fed and wealthier.

For my part, sir, until I have heard something *really telling* against the advice of Knowlton to proportion the family to the means of the parents, and to the state of civilisation and capital, I shall remain, as I have always been, a modern Malthusian, or disciple of the late J. S. Mill, Joseph Garnier, &c., and look on *conjugal prudence* as the truest basis of hygiene, &c., and all the social virtues.

I am, sir, yours faithfully,

C. R. DRYSDALE, M.D., M.R.C.P. Lond., F.R.C.S. Eng.

17 Woburn Place, W.C. July 20, 1877.

SIR CHARLES TREVELYAN, BART., ON "TEMPERANC AND MEDICAL RELIEF."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Something is being done to mitigate the violent contrast between the gin palace and free dispensary alluded to by Sir William Gull in his statesmanlike speech at the Society of Arts. Never was a subject more fully set forth at a single meeting than at the conference in the garden at Grosvenor House. All agreed that the offer of a better alternative for the refreshment and social enjoyment of the public-house was an indispensable condition of progress in temperance, and that this alternative could only be provided to the necessary extent by its being worked out by active, influential persons, each in his own locality, on the self-supporting, remunerative, commercial principle. Several papers were read illustrative of the causes of success or failure, and a committee was appointed to gather up the various experiences on the subject, so that all who assist in this great enterprise may enter upon it with a confidence which cannot belong to isolated efforts.

The reform of medical relief has reached a more advanced stage. The result of seven years' work was summed up at a second conference at the Society of Arts, at which we were assisted by some of the most eminent members of the medical profession; and the fresh impulse now given is not likely to subside until the object has been attained. The discussion is being actively prosecuted at Manchester, Birmingham, and Liverpool, as well as in London; and owing to the increase of population in many towns of the second class in various parts of England the local "infirmary and dispensary" is quite unequal to the demands upon it. Both in the metropolis and the provinces the remedy proposed under various forms is—medically, that the out-patient departments should be decentralised, and, financially, that the burden should be extended over a much wider surface. In other words, that a subsidiary system of provident dispensaries should be established on the mutual assurance principle, whereby the hospitals and infirmaries would be relieved of all which are not properly hospital cases.

Meanwhile a movement has commenced for self-supporting hospitals for the upper and middle classes. This principle has long been established in every other civilised community. When the present registrar to the Admiralty was a young man he was sent on a public mission to French Guiana, and, falling sick of the prevailing fever, he was told that he "ought at once to go into hospital." There he found a clean, cheerful, airy apartment, and a skilled sister of charity to nurse him, and he got well much sooner than he could have done in his lodgings. When the General Hospital at Madras was rebuilt, a wing overlooking the river was appropriated to civil and military officers, and other persons of the upper or middle class who require medical treatment and nursing. There is an obvious economy in connecting such arrangements with existing hospitals instead of providing separate buildings, with their ancillary establishments, expressly for the purpose. In practical New England this principle is consistently carried out; for, except a few endowed "free beds" for destitute cases, everybody pays according to his means, from the lady or gentleman who has a separate room to the artisan in the common ward.

This is evidently a case for revising our insular institutions by the light of the larger experience of the civilised world. The proposition enunciated at the meeting at the Mansion House was that there ought to be hospitals for the upper and middle classes. This is true, but is comprehended in a wider truth—that all hospitals should be adapted to the wants of all classes of the community. This is demanded by the most obvious motives of the economy of money and time, including the precious time of medical men in high repute, and it is also recommended by ulterior considerations of a moral and social kind which will occur to every person who reflects upon the subject.

C. E. TREVELYAN.

Medical News.

Royal College of Physicians of London, July 26, 1877.—Admitted Fellow: William Jelly, Madrid.

Admitted Members:—

Houghton, Walter Benoni, M.D. Lond., 114 Tottenham Court Road, W.
Longstaff, George Blundell, M.B. Oxford, Wandsworth.
O'Neill, William, M.D. Aberd., Lincoln.
Phillips, Charles Douglas Ferguson, M.D. Aberd., 107 Lancaster Gate, W.
Savage, Thomas, M.D. St. And., Birmingham.
Sullivan, John, 28 Keppel Street, London, W.C.
Thomas, William Robert, M.D. Queen's University, Ireland, Sheffield.
West, Samuel Hatch, M.B. Oxford, 6 Colville Terrace West, W.
Wybrants, Jonathan, M.D. Aberd., Shepton Mallett.

Admitted Licentiates:—

Aplin, Alfred, 8 Harrington Street, N.W.
Arnott, Sandford, 24 New Ormond Street, W.C.
Bennett, Arthur, London Hospital, E.
Beresford, William Hugh, 4 Gloster Crescent, W.
Biale, John Seton, St. George's Hospital, S.W.
Brett, John, 49 Ladbroke Grove Road, W.
Brock, Alexander Cameron, Dorking.
Collet, Golding Bird, 155 Marylebone Road, N.W.
Evans, William Morgan, Guy's Hospital, S.E.
Frankish, William John, University Hospital, W.C.
Friend, Herbert Edward, St. George's Hospital, S.W.
Galloway, Arthur Wilton, 54 Fitzroy Road, N.W.
Gaisford, Martin, King's College Hospital, W.C.
Gomes, Dominic Anthony, 18 Tavistock Street, W.C.
Ground, Edward, King's College Hospital, W.C.
Hemsted, Arthur, Wellingborough.
Heinemann, William, 36 Hilldrop Crescent, N.W.
Langdon, John Sydney, University Hospital, W.C.
Lacey, Charles William, Guy's Hospital, S.E.
Mackay, James Jerome, King's College Hospital, W.C.
Mackern, John, 4 Park Place, Blackheath, S.E.
Pickford, John Kemble, Maiden Newton.
Reporter, Maneckjee Eduljee, 1 Gower Place, W.C.
Stewart, Howard Douglas, King's College Hosp., W.C.
Vasey, James Adams, 5 Cavendish Place, W.
Wiglesworth, Joseph, Liverpool.

Royal College of Surgeons of England.—The following gentlemen, having passed the required examination for the diploma, were duly admitted Members of the College at meetings of the Court of Examiners on July 24th and 25th:—

Ainsley, Thomas G., West Hartlepool.
Allard, Joseph H., L.R.C.P. Edin., Tewkesbury.
Armstrong, G. R., L.K.Q.C.P.I., Kingstown, Dublin.
Ashworth, John W., Manchester.
Bartlett, Felix P., Brixham.
Benham, Frederick L., Gloucester Terrace.
Bowen, Owen, Llandilo.
Bradford, Cordley, Birmingham.
Briggs, Henry, M.B. Ed., Prestwich, Manchester.
Brock, Alexander C., L.R.C.P. Lond., Guernsey.
Cooper, Thomas H., Hampstead.
Dennis, Frederic S., M.D., New York.
Devis, Charles J., Birmingham.
Drinkwater, Harry, M.B. Edin., Sunderland.
Dumbleton, Edgar H., Southampton.
Evans, Henry, Barmouth.
Fairclough, John J. K., M.D., Manchester.
Fenwick, Bedford, M.B., Harley Street.
Galloway, Arthur W., L.R.C.P. Lond., Fitzroy Road.
Gomes, Dominic A., L.R.C.P. Lond., Bombay.
Gristock, William, L.S.A., Blandford Square.
Harris, George F. A., Sutherland Gardens.
Harrison, Damer, L.K.Q.C.P.I., Liverpool.
Jewell, Charles C., Brighton.
Jones, Cyril L., L.S.A., Blackfriars Road.
Jones, Lloyd, M.B., Narberth.
Jones, Roger H., Liverpool.
Jones, William F., Bangor, North Wales.
Kirker, Gilbert, M.D. Belfast.
Langdon, John S., L.R.C.P. Lond., Queen's Sq., W.C.
M'Clelland, Joseph, M.D., Liverpool.
Messum, Julian A. B. G., Champion Hill.
Morgan, Edward S., Swansea, South Wales.
Norton, Thomas C., Bristol.
Pilkington, John E., Manchester.
Prior, Edward T., Talbot Square.
Prowse, Arthur B., Cambridge.
Prytherch, Hugh, L.R.C.P. Edin., Anglesea.
Rose, James, Liverpool.

Scott, W. George, L.S.A., Bedford.
Shaw, Charles T. K., St. Leonard's-on-Sea.
Sidebotham, George W., Hyde.
Smith, Alexander J., Ladbroke Crescent.
Smith, Herbert U., Basildon.
Steele, Charles E., Liverpool.
Symington, Johnson, M.B. Edin., Fenny Stratford.
Turner, George Robertson, Sussex Gardens.
Uhthoff, John C., Penge.
Vasey, Samuel W., Cavendish Place.
Walcot, H. Lewis, L.R.C.P. Edin., Tenby, Wales.
White, Howell H., Corwen, North Wales.
Whittle, Ewing M. G., Cambridge.
Wright, Arthur, L.S.A., Paddington.

University of London.—The following are lists of the candidates who have passed the recent examinations :—

PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION.

First Division.

Adeney, Edwin, L. Guy's Hospital.
Ballance, C. A., St. Thomas's Hos.
Barron, Alexander, Owen's Coll.
Batterham, J., Westminster Hosp.
Berry, Harry P., Guy's Hospital.
Blore, Isaac, The Leys, Cambridge.
Cassal, C. E., University College.
Clegg, Joseph, Owens Coll.
Corbould, H. F., Charing Crs. Hos.
Crookshank, E. M., University Col.
Cuffe, R. E. G., St. Mary's Hosp.
Currie, Oswald J., Guy's Hospital.
Dakin, William R., Owens Coll.
Day, D. D., St. Barthol. Hosp.
Dixon, G. P. N., St. Barthol. Hosp.
Edmunds, Lewis H. Univ. Coll.
Grayling, A., St. George's Hosp. & Epsom College.
Griffiths, Philip Rhys, Univ. Coll.
Gross, Charles, Guy's Hospital.
Hardy, H. L. P., London Hosp.
Harper, Charles S., Guy's Hosp.
Harris, Thomas, Owens College.
Hill, George W., King's Coll.
Holman, Fred M., Univ. Coll.
Hoole, Henry, Charing Cross Hos.
Horrocks, Wm. H., Owens Coll.
Horrocks, Wm. Hy., Owens Coll.
Hughes-Jones, J., St. Barth. Hos.
Hutchinson, J. F., London Hosp.
I'Anson, Leonard, Epsom Coll.
Jefferson, A. J., St. Thomas's Hos.
Jones, Robert, St. Barthol. Hosp.
Lane, Frederick H., Epsom Coll.
Lane, Wm., Guy's Hosp.
Lewers, Arthur, H. N., Univ. Coll.
Maddison, Wm. T., King's Coll.
Marriott, Hyde, Owens College.
Martin, Sydney H. C., Univ. Coll.
Miller, Herbert P., University Coll.
Moline, Paul Frank, Univ. Coll.
Mortimer, D. E. J., W'minster Hos.
O'Kane, Michael, Guy's Hospital.
Prothero, R., L'pool Med. Sch. & St. Bartholomew's Hospital.
Parton, Lionel P., Univ. Coll.
Rice, Bernard, St. Barthol. Hosp.
Rice, Edward, St. Barthol. Hosp.
Roberts, Richard P., Univ. Coll.
Rogerson, John T., Owen's Coll.
Rygate, David John, London Hos.
Sellers, W., Univ. of Edinburgh.
Shaw, Harold B., Epsom Coll.
Smith, John, Guy's Hospital.
Stephen's, L. E. W., Epsom Coll.
Stoddart, F. W., University Coll.
Thompson, St. Clair, Private study.
Treherne, F. H., St. Barth. Hosp.
Udale, Joseph, J., Guy's Hosp.
Webb, Malcolm, Owens College.
Whitelegge, George H., Univ. Coll.
Whiting, John, St. Barthol. Hosp.

Second Division.

Barker, A. J. G., University Coll.
Bose, Pramatha N., University Coll
Collins, Wm. J., St. Barthol. Hosp.
Day, John R., University College.
Dobell, Edmund J., Univer. Coll.
Dobson, Joseph, Private study.
Downing, Charles, University Coll.
Fletcher, John, Owens College.
Gray, John. A., St. Barthol. Hos.
Hickman, F., Univ. of Edinburgh.
Hickson, Sydney J., Univ. Coll.
Hill, William H., University Coll.
Hosker, James A., Private study.
Laurent, Eugene A., Univ. Coll.
Lister, Joseph H., Guy's Hospital.
M'Donagh, James S., Univ. Hosp.
Maitland, Alfred D., Univ. Coll.
Maude, Frederic, St. Barthol. Hos.
Morley, R. B., Leeds Sch. of Med.
Newsholme, Henry, Univ. Coll,
Pemberton, T. P., Queen's College, Birmingham.
Rabbeth, Samuel, King's College.
Richmond, John, Guy's Hospital.
Salmon, Arthur G., St. Barth. Hos.
Sanders, Charles, St. Barthol. Hos.
Scarth, Isaac, Owens College.
Shaw, John, University College.
Shaw, Lauriston E., Univ. Coll.
Wills, Arthur T., Owen's College.

NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in Loadon, Dublin, or Edinburgh.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

SCARCE NUMBERS.—Double price will be given for the following numbers of this Journal if sent to the London office:—October 6, December 22, 29, 1869.

A HOMŒOPATHIC PRESCRIPTION.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—The prescription which you give, I presume on the authority of a Belgian medical journal in which it first appeared a couple of years ago, directing "Virgin's Milk" to be dispensed in powder, is an illustration, supposing the representation to be genuine, of an apothecary's difficulty in reading a physician's handwriting. The original prescription was—℞ Tinct. Hamamelis Virginica, a preparation as well known to most pharmaceutists as Liebfraumilch is to wine merchants.

I am yours, &c.,
A. C. P.

AN ERROR IN THE PHARMACOPŒIA.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Excuse me if I take the liberty of asking you to be pleased to state plainly—for the benefit of your numerous professional readers—what correction in our copies of the British Pharmacopœia you really recommend us to make respecting the formula for the preparation of the *liquor arsenicalis*.

Your obedient servant,
M.D.

[*** Our correspondent should correct his copy by the note in our issue of July 25, page 78. Drachms, not ounces, is the correct quantity of compound tincture of lavender in the formula for liquor arsenicalis.—ED.]

DR. DE LISLE ALLEN FUND.

THE Hon. Treasurer begs to announce the following subscriptions to the above-named Fund in response to the appeal in our number of July 25 :—

	£	s.	d.
A. H. Fowler, Esq., Cirencester	5	0	0
Hughlings Jackson, Esq., M.D., London	3	3	0
Russell Reynolds, Esq., M.D., London	3	3	0
G. Ball, Esq., M.D., Hereford	2	2	0
Tilbury Fox, Esq., M.D., London	2	2	0
Carr Jackson, Esq., London	2	2	0
Sir W. Jenner, Bart., M.D., London ..	2	2	0
H. Stear, Esq., Saffron Walden	2	0	0
A. E. Barker, Esq., London	1	1	0
G. Bury, Esq., Whetstone	1	1	0
I. T. E., Esq., Berkhampstead	1	1	0

Further subscriptions to the Fund sent to the Hon. Treasurer, Dr. Benjamin W. Richardson, F.R.S., 12 Hinde Street, London, W., or to the "De Lisle Allen Fund," Union Bank of London, Argyll Place, Regent Street, W., will be thankfully acknowledged.

VACANCIES.

Royal Free Hospital, Gray's Inn Road, W.C.—Assistant Physician and Assistant Surgeon. Honorary. Testimonials to Mr. Blyth, Secretary. (See Advt.)

Westminster Hospital.—House Physician, House Surgeon, Obstetric Assistant. Board and lodging furnished for each appointment, but no salary. Applications to the Secretary.

Wilts County Lunatic Asylum.—Assistant Medical Officer. Salary, £110, with board. Applications to the Clerk of the Visitors, Devizes.

Boyle Union, No. 1 Dispensary District.—Medical Officer. Salary, £120 per annum. Election, Aug. 7.

Ennistyman Union, Miltown, Malbay Dispensary.—Medical Officer. Salary, £100. Election, Aug. 8.

Queenstown Dispensary.—Resident Apothecary. Salary, £70 per annum, with perquisites amounting to £45. Election, Aug. 29.

Tamworth Union.—Medical Officer of Health for Rural Sanitary Board. Salary, £120. Also Medical Officer to the Union Workhouse and District. Salary, £105, with fees extra. Sealed applications to the Clerk to the Union.

Honiton.—Medical Officer of Health. Salary, £20. Applications to the Town Clerk.

South Yorkshire Lunatic Asylum.—Assistant Medical Officer. Salary, £100, with board and apartments. Address Dr. Mitchell, Wadsley, near Sheffield.

APPOINTMENTS.

BATEMAN, A. W., B.A., L.R.C.P.Ed., L.R.C.S.Ed., a Junior Resident Medical Officer to the Royal Free Hospital.

CAMERON, A., M.D., L.R.C.S.Ed., Medical Officer for No. 2 District of the Bath Union.

CARLYON, T. B., M.R.C.S., a House Surgeon to the West London Hospital.

DUNBAR, J. J. MacWhirter, L.R.C.P.L., M.R.C.S.E., House Physician to St. George's Hospital.

HORTON, H. J., L.R.C.P.L., M.R.C.S.E., a Surgeon to the City Provident Dispensary and Surgical Appliance Association.

LACY, A. G., L.R.C.P.L., M.R.C.S., a House Physician to Guy's Hospital.

LANGFORD, P. P., M.R.C.S.E., a Surgeon to the City Provident Dispensary and Surgical Appliance Association.

LUCAS, H. O., M.R.C.S., a House Surgeon to the West London Hospital.

PARKER, A. F., M.R.C.S.E., Assistant House Surgeon to the General Hospital, Bristol.

SMYLY, Dr. W. J., an Assistant Physician to the Rotundo Lying-in Hospital, Dublin.

WEBB, J. R. W., M.R.C.S., House Surgeon to St. George's Hospital.

Marriage.

THOMPSON—ELLIS.—July 24, at Omagh, co. Tyrone, Edward Charles Thompson, M.B., to Diana, youngest daughter of Colonel Francis Ellis.

Deaths.

BELLYSE.—On July 21, at Oakfield, near Nantwich, Edwin Swynfen Bellyse, M.D.

BLACKETT.—On July 18, at Whickham, Durham, George Price Blackett, L.R.C.P.Ed., aged 39.

ELLIOTT.—On July 22, at Belgrave Terrace, Upper Holloway, John Elliott, M.R.C.S.E., aged 80.

LAMBERT.—On July 20, at Bath, Edmund Lambert, M.D., aged 82.

LITHGOW.—On July 20, at Weymouth, James Lithgow, M.D., aged 58.

LYLE.—On July 15, at Hackney, Frederick John Lyle, Surgeon, aged 43.

IRISH POOR-LAW INTELLIGENCE.

SOME OBSERVATIONS ON THE PRESENT UNSATISFACTORY STATE OF SANITARY ORGANISATION IN IRELAND.

By THOMAS WRIGLEY GRIMSHAW, M.A., M.D.,

Fellow and Censor of the King and Queen's College of Physicians, Diplomate in State Medicine of the University of Dublin, Physician to Dr. Steeven's Hospital, Senior Physician to Cork Street Fever Hospital, and Chairman of the Council of the Irish Medical Association.

(Continued from our last.)

THE Committee also pointed out the anomaly of styling the dispensary medical officers "sanitary officers," and proposed an amendment to remedy this anomaly, which amendment was strongly insisted on by the Colleges of Physicians and Surgeons, and although not resisted by the chief secretary, was, from some cause or other, not introduced into the Bill. It is difficult to ascertain to whom the use of this objectionable title is due, but it appears to have been prompted by some one who desired to keep the position and emoluments of the officers as low as possible, and when taken in conjunction with the terms "sanitary sub-officer," "consulting sanitary officer," and "executive sanitary officer" employed in the "orders" of the Board, was evidently the key-note which prompted the present confused and levelling set of titles. This peculiarity of title is the more remarkable when we compare the clauses of the English and Irish Acts with one another. The tenth clause of the English Act of 1872 reads—

"It shall be the duty of every urban sanitary authority to appoint, from time to time, a medical officer of health being a legally-qualified medical practitioner.

"It shall be the duty of every rural sanitary authority to appoint, from time to time, a medical officer, or officers of health, being qualified as aforesaid, an inspector or inspectors of nuisances, a clerk, and a treasurer, and such other officers and servants as it may deem necessary for the efficient execution of the purposes of the Sanitary Acts.

* * * * * *

"The Local Government Board shall have the same powers as they have in the case of a district medical officer of a union with regard to the qualification, appointment, duties, salary, and tenure of office of a medical officer of health or other officer of a sanitary authority, any portion of whose salary is paid out of moneys voted by Parliament."

The provisions of the Amending and Consolidating Act of 1875, which is now the law of England, are the same as those quoted, with a few verbal alterations. Now let us compare this with the corresponding enactment for Ireland.

Clause 10 of the Irish Act of 1874 reads—

Every medical officer of a dispensary district shall be a sanitary officer for such district, or for such part thereof as he shall personally be in charge of, with such salary, or additional salary, as the sanitary authority thereof may determine with the approval of the Local Government Board; and every sanitary authority, whether urban or rural, shall appoint such other sanitary officers, including a medical superintendent officer of health, when deemed necessary, as the Local Government Board shall in each case direct, with such salaries, or additional salaries, as the said sanitary authority shall determine, with the approval of the Local Government Board; and the said Board shall assign to the dispensary medical officers and to the other sanitary officers, if any, and to the medical superintendent officer of health, if such an officer be appointed for the sanitary district, their respective duties and functions in the discovery, or inspection, or removal of nuisances, in the supply of pure water, in the making or repairing of sewers and drains, or in generally superintending the execution of the sanitary laws within the district.

Every such salary, or additional salary, so determined or approved, shall be payable from such local fund, as the Local Government Board shall indicate, as property chargeable therewith, and such part thereof as Parliament shall, from time to time, determine, shall be recouped to such local fund out of moneys to be voted by Parliament; and the Local Government Board shall have the same powers with regard to the qualification, appointment, duties, regulation of salary, and tenure of office of every sanitary officer as they have in the case of a medical officer of a dispensary district: provided, with regard to salaries, or additional salaries, whereof any portion is to be recouped to any local fund from any moneys voted by Parliament, the amount of any new salary and the proportion between any existing salary and the addition thereto, shall be regulated according to a scale to be approved of by the Commissioners of Her Majesty's Treasury.

Now, comparing the English and Irish enactments, it is clear that some one who had little respect for the dignity of the medical profession inserted the titles in the Irish Act, and some one who had little regard for their pocket, introduced the final clause about a "scale" to be fixed by the Treasury. There is not a word about a scale in the English Act. Each salary is left an open question to be fixed upon equitable principles hereafter. The most remarkable point, however, is, that the clause, as it stood in the Irish Bill as read a first time, and which must have received the approval of the Treasury like other Government Bills, defined "inspectors of nuisances" as such in the same manner as the English Act, and there was not a word about the relative or any "scale" to be fixed by the Treasury. All these were put in at the last stages just before the Bill left the Commons on the 19th of July, and after all opposition had been withdrawn. Sir M. Hicks-Beach informed the recent deputation of the Irish Medical Association, which waited upon him in London, that the Treasury had insisted on the "scale." How is it that the Treasury was so anxious to have an economical scale for the salaries of Irish medical men, but never ventured to propose such a thing for England? And how is it that this scale was put in at the last, early on a July morning, when all the medical watchers of the measure had left London?

How much is spent on sanitary salaries in Ireland? Only £24,758, of which the Imperial Treasury pays the munificent sum of £12,172! or at the rate of one halfpenny per head of the population. And this is all that sanitation in Ireland costs the State! It is unnecessary to say more, as in England the payments in a dozen good towns would reach the payment for the whole of Ireland. I have no ambition to be an "Irish greivance monger," but if the public health administration has failed through the false economy of the Treasury, there is in this case a real and substantial grievance.

It is utterly absurd to expect that the work to be done by the dispensary medical officers under the Sanitary Act can be efficiently performed for the insignificant salaries now accorded. The salary in many instances is not sufficient to cover the expenses to which the medical

officer is put in the discharge of his duties. The Commission on Local Government and Taxation, already quoted, have stated that "the addition, if any, to his salary is usually very trifling; the work, if properly carried out, is of a very onerous and invidious character." The salaries at present paid are an insult to the *status* of the men to whom they are offered, and can scarcely be considered as of the nature of the remuneration for the services they render. The payment of nominal salaries for "onerous and invidious duties" is a direct premium on insufficient discharge of those duties. I apprehend that, unless a speedy amendment takes place in the position and remuneration of the Poor-law medical officers for the valuable services they render the State, that very soon the service will show signs of decay and become a disgrace instead of credit to Ireland.

This paper has run to a greater length than I at first anticipated, but I think it was essential to prove that the present unsatisfactory state of things has arisen owing to the neglect of well-known principles, principles laid down in the first instance by practical physicians like myself, and which have been endorsed by all sanitarians of whatever profession or position in the community, and I think I have fully justified the remark that "had the recommendation of the Joint Committee on the Bill of 1874 been adopted the present state of things could never have arisen."

In conclusion, I would add that my attention (and I think the attention of the Poor-law medical officers of Ireland) has been directed to the importance of preventive medicine by the experience I and they have had of the terrible waste of life and the fearful sufferings which are endured, especially by the poor, by the ravages of preventible disease. When I first became attached to Cork Street Fever Hospital, twelve years ago, I saw that it was as much the duty of the physician to endeavour to *prevent* as to cure disease. I have tried to fulfil this duty, and I think I may state that every dispensary medical officer in Ireland is prepared to do so too; have I also to affirm that the medical men of Ireland, while willing to assist the Government in every way to promote the health of their fellow-countrymen, are determined to bear no part in a sham system of sanitation, and would rather not be "sanitary officers" or even "medical officers of health," than share the disgrace which is sure to follow on the outbreak of an epidemic, if the present unsatisfactory system is continued.

CORRESPONDENCE.

ARE THE IRISH SANITARY LAWS OF USE?

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Kindly publish the following facts:—

On 17th June, 1877, a woman named Mary Ellis was summoned by the executive sanitary officer of the Nenagh union, before the Killaloe bench, to abate a nuisance for which she was noticed to do so; 16th December there were four other cases for which notices to abate were served 3rd January, 17th February, and two 5th March last all were dismissed.

On 24th I received from the clerk of the Nenagh Union a copy of a resolution passed 21st, stating "the clerk was acting strictly under their directions, and did nothing more than what was in their opinion his strict duty."

I should have mentioned that I also wrote on the 20th to the Local Government Board stating the simple facts.

On the 6th inst. I received a letter from them referring to that letter, in which they stated "they do not feel called upon to interfere with the sanitary authority in regard to any proceedings they may deem necessary to institute with a view to improve the sanitary condition of their district," they go on to say "from the information, however, before them in the present instance, it appears to the Local Government Board that you have overlooked the fact that the summons dismissed by the bench was for the recurrence or repetition of a nuisance once abated.

On the 7th I replied and sent a copy of complaint in the summons which says "in not removing a heap of manure that remains in defendant's yard at Ballina," there is no complaint of any "recurrence or repetition" in that summons. I also enclosed two declarations, one of Mary Ellis, and the other of her son Daniel (who lives with her). In both declarations it is stated that there was only one heap of manure made in the yard for the *last twelve months;* that that heap was there long before Christmas, and remained there until the middle of May, when it was taken for turnip sowing. She declares she got no notice to abate, her son declares he never saw or heard of any such notice having been served on his mother.

On 13th the Local Government Board wrote to me "that on inquiry made, it appears that though the sanitary authority had sufficient grounds for the proceedings taken, the offence should have been more clearly stated in each case on the face of the summons."

One more fact, viz., subsequent to the notice of Dec., 1876, typhoid fever broke out in Ballina, one case proving fatal.

It is now for the public to say did the legislature ever contemplate that a nuisance should be allowed to remain *for six months after notice to abate same was served and then to prosecute when same was abated,* or that any rural sanitary board should give such strict orders to their executive sanitary officer, or that the Local Government Board should not "interfere" with Local Sanitary Authority.

The law thinks twenty-four hours sufficient notice to allow to elapse after service of notice before commencing a prosecution (see Form c. in schedule, to 18 and 19 Vic. c. 121).

I remain, yours truly,

W. S. STUDDERT.

Keeper View, O'Brien's Bridge,
20th July, 1877.

AMENDMENT OF THE MEDICAL CHARITIES SYSTEM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—It strikes me that a good opportunity will shortly be afforded the hard-worked and wretchedly-paid dispensary and workhouse medical officers of Ireland of making known their many grievances and disabilities at the promised government inquiry about to take place regarding our workhouses and the re-arrangement of dispensary districts.

I earnestly hope the Irish Medical Association will bring all its great influence to bear on the Government through our representatives in Parliament, and otherwise for the purpose of having the question of the appointment, pay, and *status* of workhouse and dispensary medical officers brought within the scope of the inquiry, and have as many as possible of their body examined by the Committee.

Moreover, an amendment of the Medical Charities' and Poor-law Acts is almost as necessary as that of the Public Health Act (Ireland), as regards the multiform abuses which have cropped up during the last twenty years in the issue of visiting and dispensary tickets; the want of uniformity in the scale of medical salaries, and the insufficiency of the same; coupled with the capricious mode of apportioning them adopted by many boards of guardians; and the uncertain position in which aged and worn out medical officers—of very moderate means—are placed as regards superannuation. It is very probable that several workhouses will be dispensed with, and I think an effort should be made to have them utilised as union asylums and general hospitals, and also have the Poor-law, lunacy, and county infirmary systems *amalgamated,* and formed into a *branch of the civil service.* The medical appointments to be given away by competitive examination.

I am, dear Sir,

Your obedient servant,

SCRUTATOR.

VITAL STATISTICS OF DUBLIN—QUARTERLY SUMMARY

Births.—IN the Dublin District, the births registered

during the quarter amounted to 2,410 being equal to an annual ratio of 30·6 in every 1,000 of the population. The number of births in the City was 32·2 in every 1,000; and in the suburbs only 25·0 in every 1,000. There was registered in London during the same period an annual birth-rate of 35·1; in Glasgow 40·1; and in Edinburgh 36·1 in every 1,000 of the population.

Deaths.—The deaths registered in the Dublin District during the quarter—afford an annual ratio of 30·0 in every 1,000 of the population. Omitting the deaths (97) of persons admitted into Public Institutions from localities outside the district, the rate for last quarter was 28·8 per 1,000. The number of deaths north of the Liffey, afford an annual mortality of 31·2 in every 1,000 of the population; and south of the river 30·2. In the suburbs of Rathmines, Donnybrook, Blackrock, and Kingstown, the number was 22·2 in every 1,000. The ratio of deaths registered in London during the same period was 22·1 in every 1,000 of the inhabitants; in Glasgow 26·6; and in Edinburgh 22·5.

Diseases.—The number of deaths from zymotic diseases registered during the quarter is 411 or 17·4 per cent. of the deaths from all causes, and equal to an annual mortality of 5·2 in every 1,000. The average number for the previous ten years was 398, and the number for the first quarter of this year was 345. The increase in the mortality from these diseases last quarter is due to the prevalence of measles. The deaths from this disease and its complications number 146, 60 occurred in the Summer-hill District; 23 in (Blackhall-street) District; 33 in (Meath-street) District; there were but few deaths from this cause in any of the other districts. In 42 of the 146 cases in which measles terminated fatally, the disease is stated to have been complicated with bronchitis, and in 30 with pneumonia. Eight deaths from small-pox were registered during the quarter. Fever caused 79 deaths, of which 27 were from typhus, 39 from enteric, and 13 from simple continued fever. In the preceding quarter 91 deaths resulted from fever, but in the second quarter of last year only 50 deaths from fever were registered. The remaining deaths from zymotic diseases include 23 from scarlet fever (an unusually low number), 34 from whooping-cough, 25 from croup, 9 from erisipelas, 5 from influenza, 2 from quinsy, 31 from diarrhœa, 3 from dysentery, &c. One hundred and sixty-five children died from convulsions. Some diseases of the respiratory organs were exceptionally fatal for the June quarter; thus, bronchitis alone caused 396 deaths against 299 in the second quarter of last year, and 253 in the corresponding quarter of 1875, the 396 deaths, being 16·8 per cent. of the deaths from all causes, and equal to an annual rate of 5 per 1,000 inhabitants; 93 deaths were referred to pneumonia or inflammation of the lungs, 5 to pleurisy, 2 to asthma, 1 to laryngitis, and 49 to lung disease unspecified. Fifty-eight deaths were attributed to paralysis, 25 to apoplexy, 13 to epilepsy, 8 to cephalitis, 2 to insanity, 51 to brain disease unspecified; 103 to heart disease, 7 to aneurism, 1 to pericarditis, 2 each to jaundice and hepatitis, 32 to liver disease unspecified; 11 to nephria, 4 each to diabetes and nephritis, 3 to cystitis, 1 to stone in the bladder, and 19 to kidney disease unspecified. Phthisis caused 299 deaths, or 12·7 per cent. of the total; mesenteric disease 50, hydrocephalus 53, scrofula 20, gout 1, and cancer 39.

Provincial Towns.—The death-rates in the seven Provincial town districts are:—Belfast, 30 per 1,000 of the population in 1871; Cork, 25 per 1,000; Limerick, 27; Londonderry, 19; Waterford, 22; Galway, 34; and Sligo, 24 per 1,000. There were no deaths from small-pox registered in any of these districts. In Belfast, 59 deaths from measles, 56 from fever, 17 from whooping-cough, 14 from scarlatina, 2 from diptheria, and 35 from diarrhœa were registered; these 183 deaths being equal to an annual rate of 4 per 1,000 of the population in 1871. The mortality in the other districts from the principal zymotic diseases was comparatively low.

CARLOW UNION.—BAGENALSTOWN.

THE Chairman called attention to a notice of motion to increase the salary of the medical officer of the Bagenalstown district from £100 to £120 a year.

Mr. Newton.—When Dr. Allen was appointed, he was given to understand that the reason that his salary was £20 less than that of the other medical officers, was on account of the large superannuation allowance granted to Dr. Trayer, and that when that allowance ceased he would be put on a par with the other Dispensary districts.

Mr. Malcomson said, if it were desirable to place Dr. Allen on the same footing with the other medical officers, they should level them all down.

Mr. J. F. Leckey we would not have the power of doing it. The Local Government Board would not allow it.

Mr. W. R. Fitzmaurice said if Dr. Allen were appointed on the understanding that his salary of £100 would be increased to £120 when the superannuation to Dr. Trayer would cease, he for one considered it would be a breach of faith not to increase it.

Mr. J. F. Leckey.—I do not see why he should not be put on the same footing as the other medical officers of the Union.

Mr. Newton.—And he has nearly double the number of tickets of any other, except Carlow and Tullow.

Mr. Butler said on going to the Dispensary, he found it clearly stated on the minutes that Dr. Allen was to get the increase when the superannuation to Dr. Trayer ceased, and in consequence he changed his mind at once.

A resolution was proposed to the effect that the salary be increased to £120 per annum.

A vote was then taken, with the following result:—

For—9. Against—6.

SLIGO DISPENSARY.

ELECTION OF A MEDICAL OFFICER.

A SPECIAL meeting of the Committee was held on Wednesday last, for the purpose of electing a medical officer in the room of the late Dr. Devany.

Three candidates offered themselves for election, Dr. Michael F. Cox, who lately came to reside in Sligo, Dr. Thomas D. Palmer, medical officer of the Boyle dispensary, Dr. O'Donovan withdrew.

Chairman—It is unnecessary for me to say anything on the subject, except to say why, at a recent election, the old rule which existed here of having a Protestant and a Catholic doctor was not acted upon.

The reason why they should elect a Catholic doctor that day was obvious. Nineteen-twentieth of the people of this dispensary district were of the Catholic persuasion.

Mr. Walker—It is a fact, that you recently attended at the meeting when Dr. M'Guire was brought forward in opposition to Dr. Laird, although there was then another Roman Catholic dispensary doctor in the district, but you voted for Dr. M'Guire.

Chairman—If I did, I forget it, and it is one act of my life I must regret.

High Sheriff proposed Dr. Palmer. I have been only recently appointed a member of the committee, and I really cannot say if this rule was in existence. But, if it ever did exist it certainly was broken by the candidature of Dr. Maguire. As regards the Roman Catholic poor wishing to have a Roman Catholic doctor, that argument cannnot be considered a reasonable one, as the doctor does not attend people to administer to them the last rites of their church. Perhaps some of us would call in a Mahomedan if we were sick, if we knew he was well qualified and a superior medical man.

Mr. James O'Connor proposed Dr. Cox as a candidate.

Chairman—It is not right the religious question should be now gone into (a laugh). Whoever introduced it did not act with much judgment.

High Sheriff—But who did introduce it?

Mr. Olpherts—I must say this foreign religious element has been imported into this matter. I think it would be better to discuss the qualifications of the candidates upon their merits as medical men.

Their voted for Dr. Cox, 11; for Dr. Palmer, 21.

ABBEYLEIX UNION.

SANITARY BUSINESS.

THE sub-sanitary officer, Dobbs, reported that closets from houses of the Rev. Mr. Fisher and Dr. Stoney emptied into the "sewer" which runs through the Main Street, Abbeyleix.

Mr. Talbot—I thought Dr. Stoney was a sanitary officer himself. (A laugh.)

Clerk—It is Mr. Dobbs' duty to call Dr. Stoney's attention to the matter.

Mr. Talbot—Dr. Stoney should call his own attention to it. Three-fourths of the money we pay for sanitary purposes goes away for nothing.

Mr. Foster said he was of a similar belief.

Mr. Talbot—Take the usual course, and serve them with notices.

This was agreed to.

CELBRIDGE UNION.

ELECTION OF A MEDICAL OFFICER OF THE WORKHOUSE.

THERE were six applicants for the post of medical officer, namely—Dr. White, Celbridge, Dr. Wade, Kilcock, Dr. Penny, Dublin, Dr. Buckley, Dublin, Dr. Kilbride, Athy, and Dr. Hughes, Dublin.

The votes were taken on all candidates, the lowest number of votes to retire.

Dr. White was elected by a majority of four.

DROGHEDA UNION.

SOME time in the past year, Dr. Delahoyde, the oldest and one of the most respected medical officers of the union, took leave of absence for a fortnight, appointing as his substitute a medical man accustomed to that kind of duty, and made application for payment under the circumstances. The guardians at that time did not think they would be justified in making payment. Dr. Delahoyde renewed his application in a letter to the Local Government Board. The Local Government Board transmitted it to the guardians to deal with it, as the Local Government Board declined to interfere.

Mr. Coddington referred to Dr. Delahoyde's long connection with the Board, and expressed the general feeling entertained of Dr. Delahoyde's great skill, kindness, and attention. Forty-one years was a very long connection with the charge of a medical district, and during that time he had not had one week's vacation. He had always been as efficient as any medical man he knew of, and after all these years of long service he had only asked for one fortnight's leave at the expense of the board, and he was satisfied it was not too much to ask from them.

It was agreed on that Dr. Delahoyde be paid two guineas a week.

CARLOW GRAND JURY.

MEDICAL EVIDENCE AT INQUESTS.

Mr. Lecky called the attention of the Grand Jury to an inquest held at Borris, where their resolution as to calling in the dispensary doctor had not been carried out by the coroner.

The Coroner explained that he was not aware of the existence of the rule in question. He would in future carry out the arrangement, but wished to know how he should manage in case the dispensary doctor was not available.

Foreman—The words are "where practicable."

SLIGO GRAND JURY.

THE CONSTABULARY AND CORONERS' INQUESTS.

The Secretary read a letter from the County Inspector, stating he had directed, in accordance with the request of the grand jury of last assizes, the constabulary *not* to request the coroner to attend in all cases of sudden death and hold an inquest. They would for the future merely notify the coroner, and leave it to him to see whether or not an inquest should be held.

ENNIS UNION.

THE REDUCTION OF OFFICERS' SALARIES.

THE following letter from the Local Government Board was received in reference to the reselution adopted on the 4th inst., reducing the salaries of workhouse officers therein referred to:—

"Sir,—The Local Government Board for Ireland acknowledge the receipt of minutes of proceedings of the Board of Guardians of Ennis Union on the 4th inst., and they desire to state that they have had before them the resolution proposing to reduce the salaries of the medical officers of the workhouse, by £15 a year each; and in reference there to the Local Government Board, beg to say that they do not consider the salaries at present paid to these officers to be excessive, having regard to the extent and nature of the duties devolving respectively on them, and to the salaries allowed to similar officers in unions which admit of comparison with Ennis Union.

"The average salaries of the medical officers of workhouses are £123 a year, all of which salaries are in excess of the salaries allowed to corresponding officers of the Ennis Union.

"True, there is a second medical officer (Dr. Greene) who also acts as apothecary at a salary of £75 a year; but the guardians will bear in mind that the rates of remuneration for the medical officers were specially determined by them last year, when Dr. Cullinan required an assistant.

"In view of these circumstances, and having regard to the fact that no grounds have been advanced to warrant the Local Government Board in approving of the proposed reductions, the board must request the guardians to be good enough to take the matter again into consideration, with a view to rescinding the resolution.

"With reference to the resolution, 'that no application for an increase of salary to the officers of this union be entertained for this year, until the officers so looking for for the increase resign their situation,' the Local Government Board desire to state that they would recommend the guardians not to adopt resolutions of this general character, which would not be binding on the guardians assembled at any subsequent meeting.

"By order of the Board,

"W. D. WODSWORTH, Assistant Secretary."

No discussion followed the reading of the above letter, and after the usual routine business had been gone through, the board adjourned.

ANTAGONISM OF POISONS.

DR. F. L. HAYNES has published in the *Philosophical Transactions*, of Philadelphia, for 1877, some experiments on this subject. From 143 experiments on rats, cats, rabbits, and dogs, he concludes: 1, that strychnia and nicotin are in no degree antagonistic; 2, that strychnia increases the convulsive action, and does not diminish the motor paralysis of nicotin; 3, that nicotin, even in paralysing doses, increases the convulsive action of strychnia; 4, that both poisons cause death by paralysing the respiratory apparatus; and lastly, that animals may be killed by injecting together doses of the two poisons which, singly, are not fatal.

ABSTRACT OF CLINICAL LECTURES ON SYPHILIS.

By S. Messenger Bradley, F.R.C.S.,

Surgeon to the Manchester Royal Infirmary, and Lecturer on Practical Surgery, Owens College.

Lecture V.—*Pathology of Syphilitic Infection—Prognosis—Treatment of the Local Lesions of Acquired Syphilis—Treatment of Buboes.*

Pathology of Syphilitic Infection.—A slight glance at the pathology of syphilitic infection was taken in the first lecture, but it is necessary for you to have a somewhat fuller account of the character of the poison and the course which it takes.

Syphilitic Infection.—There are two theories of the pathology of syphilitic infection. The English school, influenced in a great measure by the teachings of Henry Lee, embrace the one, which argues that the virus enters the system and continues to operate through the medium of the blood-vessels. The second theory is that it is by the lymphatics alone that the work is done, and this is in a great measure the belief of the American school, guided by the writings of Fessenden N. Otis. It appears to me that neither is wholly in the right, though neither is entirely in the wrong: the evidence pointing rather to show that both channels are operating, though at different periods of time; that, in other words, it is by the lymphatics that the virus gains an entrance, but it is by the blood-vessels that it makes good its residence in the system. The arguments in favour of this view seem to be as follows:—

Chauveau and Burdon Sanderson have both demonstrated the remarkable fact, that if certain septic liquids taken from an animal suffering from some zymotic disease be filtered through porcelain, that the liquid so filtered is innocuous if injected into the veins of a living animal, but that the solid residue, which is composed of bacteria, is capable of producing the original disease from which the animal whence the liquid was obtained suffered. This fact, taken in connection with the asserted discovery by Lostorfer of a peculiar syphilitic cell, seems to me well worthy of notice. It is true that much doubt has been thrown upon this alleged discovery by subsequent observers, who allege that this so-called syphilitic cell is by no means peculiar to syphilis, but is met with in various other morbid conditions, and even in a state of health. This identity, however, of Lostorfer's cell with the cells or bodies subsequently noted in other diseases, is not by any means certain, nor in the present state of knowledge, and with our present means of research, does it seem capable of proof, inasmuch as it entirely depends upon an instrument—the microscope, which is clearly incompetent to decide the question. To the microscope many cells, notably embryonic cells, appear quite similar, and indeed identical, which yet have a widely different life history; and in pathological growths the same remark holds good, many totally different structures possessing cells which are undistinguishable from each other by the microscope. This being so, it follows that the existence of a syphilitic cell peculiar to the poison is by no means upset by the detection of apparently identical bodies in diseases non-syphilitic. Assuming, for the moment the veritable existence of such a cell, and further, that it partakes of the nature of bacteria, let us see, guided by our knowledge of syphilitic phenomena, what train of symptoms would arise on its introduction into the system by (1) the blood-vessels, and (2) the lymphatics.

Now, one of the most striking properties of bacteria, and allied organisms, is the marvellous rapidity with which they reproduce themselves, one organism, *e.g.*, producing some millions like itself in the course of twenty-four hours by fissiparous division. It follows from this that if the syphilitic cell be of this character, and introduced directly into the blood current, that the characteristic symptoms of syphilis would develope with great rapidity, and, indeed, that the disease would run its course like other zymotics when the blood is primarily

affected, as variola, scarlatina, and so on, in a few days, or at most a few weeks. Nor are we limited to speculation alone as to what would ensue, but have the firmer ground of experimental evidence to fall back upon. Some years ago, when experimenting upon the unity or duality of the syphilitic virus, I introduced some scraping from an indurated chancre into a vein of a guinea-pig. A fortnight afterwards I killed it, and found what I believed, and still believe, to be gummatous exudations in the liver and kidneys. How different to such a course as this is the actual career which syphilis runs. Let us turn, then, to consider in what way the progress of the disease would be modified if it entered the system through the lymphatic vessels. If this were the channel of infectiou we should expect the cells to pass without let or hindrance along the lymph paths to the nearest gland, when a temporary arrest would take place owing to the poison germs becoming entangled in the parenchymatous meshes of the gland itself. Here the cells would multiply, and after a time, by the exercise of amœboid movements akin to those enjoyed by the leucocytes, and which probably all living masses of protoplasm possess, some of them would reach the gland next in order, when a similar course would be pursued, and so on, the glands of course increasing in size with the increase in number of their guests, until the whole chain became loaded with the poison germs; a time would then come when some of the germs would pass on into the farther lymph current, by which they would be conducted to distant parts, affecting other glands in their progress, but certainly at some time reaching the thoracic duct, and so at last being emptied into the circulation, when we should expect a fresh and more general group of symptoms to manifest themselves.

Let us now glance at the actual course of an ordinary attack of syphilis, and see how far we can reconcile the phenomena with *this* mode of invasion. After a varying period, the average being about twenty-one days, during which nothing whatever is observed, the surface which has received the poison becomes abraded, while a hard base appears and increases beneath the sore. A short pause, followed by multiple inguinal adenopathy, ensues; then a longer pause, and after this the throat ulcerates and an eruption appears upon the skin: every tissue and viscera in the body becoming liable in time to some syphilitic affection. What is the explanation of this chain of symptoms, on the assumption of the existence of a syphilitic cell, and of its entering the system by the lymphatics? It appears to me that the course of events may be explained as follows: The poison germs are at first lodged upon the unbroken skin, or on the surface of some abrasion. Here they lodge and multiply, and by their presence give rise to the exudation of some inflammatory lymph, in which they for a time remain stationary. The nutrition of the part is so affected that molecular death takes place at the surface, and some of the germs are cast off in the resultant ulcer, while others are carried by the lymphatic vessels to the inguinal glands, where they give rise to enlargement and induration in the way before described; here they remain for some time, but eventually some of them sail away, and ere long fall into the blood current, when their presence gives rise to general pyrexia and to the malaise of syphilitic fever, which ushers in the secondary symptoms. Much of the poison, however, continues to circulate by the lymphatic vessels, and so produces the tonsillar affection (the tonsils being but a congeries of lymphatics), and the posterior cervical adenopathy, which is such a common affection. The virus in the blood nearly always excites some skin disease, the various cutaneous syphilides being so many efforts on the part of the blood vascular system to eliminate the poison. After a time the patient becomes more tolerant of the virus, though it is long before it dies completely away and loses its power; ever and anon it seems to gather fresh strength, and then gives rise to some fresh symptom or group of symptoms, every organ in the body being liable to its attacks, as every organ in the body is washed by the current of the blood. That it does eventually invade the blood is placed beyond dispute, as we have now several perfectly well-authenticated cases of syphilis following an inoculation with the blood of a person suffering from constitutional syphilis.

Prognosis.—Patients are, perhaps, too prone to look upon an attack of syphilis as a trifling affair, or, at all events, as an event not likely to threaten life, even if it interferes for a time with comfort. In fact, however, syphilis is always a serious malady, frequently fatal in infancy, and very often giving infinite trouble, and even shortening life in adult age. Having already glanced at the prognosis of the disease in the hereditary form, it remains for us to consider the question when the disease is acquired, and first, I would try to reply to the inquiry—how can we tell when syphilis is cured? This query, apparently so easy to answer, is, in reality, surrounded with doubt and difficulty. We often meet with cases where there is a hiatus of ten or twenty years between one set of symptoms and another, and in the interval the patient may beget healthy offspring, and himself present every feature of perfect health. We are, however, probably justified in prognosticating future immunity from the disease if the constitutional symptoms are entirely subdued within eighteen months from the date of the initial lesion, and when a period of two years has since elapsed without any recurrence. On the other hand the older the disease the more doubtful does eventual cure become; and when we meet with a case where there are shortly recurrent symptoms altogether extending over a dozen years, no cautious surgeon would venture to promise a future free from a reappearance of the hydra-headed malady. In many cases, after existing for several years, certain symptoms become chronic, and require a constant or frequently repeated use of iodide of potassium to render existence tolerable; occasionally, indeed, we find this drug as essential to life as food or raiment.

An important question is often asked as to the propriety of marriage, and here the surgeon must guard himself against future accusation of carelessness. In no case should he counsel marriage until a full year has elapsed without any trace whatever of the virus remaining active, and even then he will be wise not to promise more than a probable cure.

The only satisfactory evidence we have indeed that syphilis is completely curable, lies in the fact that a patient occasionally contracts the disease twice or more during his life. During the active residence of the virus in the system the patient is, so to speak, syphilis-proof; if he contract a venereal sore, that sore will be a soft chancre, and will not modify the progress of the former attack or itself contaminate the system. It occasionally happens, however, that we meet with an individual who has had two distinctly indurated chancres, each followed by a train of secondary affections, and separated from each other by a period of perfect health. Unfortunately, however, though we can thus confidently speak of the possible eradication of the poison, we have no certain means at our disposal by which we can, with safety for our patient, put this question of eradication to the test.

My own experience leads me to conclude that such cases are the exception, and not the rule, and that in the majority of cases *no* such immunity is met with. Both the initial lesion and the first secondary afford important evidence in forming a prognosis. If the chancre be a typical soft sore, unaccompanied throughout its course with any basal induration, and associated with the enlargement of but a single inguinal gland, which may or may not suppurate, it is almost certain that the systemic infection will never take place, and therefore that the virus will be entirely eliminated through the channels of the chancre and the bubo. If, again, the initial lesion be associated with slight basal induration, which soon becomes absorbed, and if, following this, a mild roseola appears towards the third month, the prognosis is very favourable, and a cure may be confidently anticipated. When, on the other hand, much hardness exists at the base, or when the sore becomes serpiginous or phagedænic, and very slow and difficult to heal, and, above all, when

such a chancre is followed by a pustular eruption of secondaries, the prognosis is much more unfavourable. The disease will surely prove serious and obstinate, liable to recur, and may perhaps exist in some measure throughout the rest of life.

Syphilis cannot be regarded as a disease directly dangerous to life until it has entered upon the tertiary stage; then, however, it is quite otherwise, and syphilis becomes a disease directly imperilling existence. This is particularly the case if the arteries, or the brain, or the lungs, or the liver become the seat of the gummy exudation. In any of these situations fatal consequences may ensue. In the arteries rupture may take place, and death from hæmorrhage; in the brain, pressure may produce any and every form of paralysis, some of which are necessarily rapidly fatal; in the lungs, fibroid phthisis may put an end to life; in the liver, a fatal ascites may ensue. Once entered, too, upon its tertiary stage, the curability of syphilis becomes more and more doubtful; it is quite certain that the majority of cases which may fairly be said to be cured never reach this stage at all.

Treatment of the Local Lesion. The Soft Chancre.—The surface of a soft chancre should be dressed with strong nitric acid, as soon as it is detected; this, not with a view of destroying the specific virus, but with the object of changing the nature of the local action, and substituting an ordinary inflammation for the more obstinate form of action set up by the syphilitic poison. The best way of applying the caustic is by means of a capillary tube, the surface of the sore being previously dried, either with blotting-paper or with lint. Nitric acid is preferable as a caustic to nitrate of silver; it goes deeper, and though the pain for the moment is probably sharper, it soon passes away. Rarely the application has to be repeated a second time: most frequently the chancre heals in three or four weeks by the subsequent use of black wash. If black wash does not seem to suit, then a grain of sulphate of zinc to an ounce of water may be tried, or a solution of nitrate of silver of the same strength, or a lead lotion, may prove most useful. Iodoform, too, is a most valuable agent in promoting the healing of soft chancre. It may be employed as powder or as ointment, in the proportion of one part iodoform to seven parts of spermaceti, or it may be combined in the same proportion with glycerine. The only objection to its general use is its penetrating odour—an odour not, perhaps, unpleasant, but impossible to conceal. If, in spite of every care in regard to local treatment, the ulcer will not heal, small doses of mercury should be given, five grains of Plummer's pill night and morning, or half a grain of the proto-iodide of mercury at the same intervals, and continued whilst the chancre lasts.

The object of the surgeon should always be rather to quickly and safely cure his patient than to confirm his own diagnosis: and acting upon this he will often not only hasten the healing of the local lesions, but render the advent of secondary symptoms less likely than they might otherwise prove.

In some rare instances a soft chancre becomes phagedænic in action, slowly healing in one situation, slowly advancing in another. I have found the actual cautery, employed whilst the patient is under chloroform, the most useful application under these circumstances: afterwards dressing the sore with either lead and opium, or with black wash. Should rapid sloughing take place, the parts should be freely rubbed over with fuming nitric acid, and afterwards dressed, as in the former case.

The chancrous erosion and the Hunterian chancre both require the same treatment as the soft chancre, but in addition mercury should always be steadily administered until the sores have healed and the basal induration has quite disappeared. This treatment, though it will probably not prevent the infection of the system, certainly tends to postpone the evil day and to render the constitutional symptoms slighter when they do come.

The dry papule only requires the internal administration of mercury, no local treatment being necessary unless the papule ulcerates, when a similar treatment to that recommended above should be enforced.

Treatment of Buboes.—I pass on to consider the treatment of the different kinds of bubo—viz., the multiple bubo, the bubon d'emblée (that rare form of bubo where there is no chancre, but where the poison is absorbed through an unbroken cuticle and makes its first lodgment in the inguinal glands), the virulent bubo, and the sympathetic bubo.

The Multiple Bubo which follows an infecting chancre.—No local treatment is of the slightest service in this class of cases, nor need this be a matter for regret, as the internal (or other) exhibition of mercury is all-powerful in removing the inguinal adenopathy.

The Bubon d'Emblée.—Precisely the same remarks apply to this as to the first kind of bubo.

The Virulent Bubo, which accompanies a soft chancre or sometimes a mixed sore.—As this variety of bubo tends to suppuration, it is best to hasten the progress thitherwards by warm fomentations and poultices, and by encouraging the patient to take exercise. The abscess should not be opened on the first detection of deep fluctuation, but suppuration should be allowed to proceed until the skin is somewhat thin and glazed; then the abscess should be opened freely along the entire length of the gland, and the cavity washed out night and morning with tinct. iod. one part and water two parts, and dressed afterwards with lint soaked in an astringent lotion. Exercise should now be very restricted, and any sinus which appears should be at once followed up and treated like the large abscess.

The blue overhanging edges of the incision, which are such common features in this form of bubo, are best destroyed with some caustic—none better for the purpose than potassa fusa cum calce. It not unfrequently happens, however, that the gland itself assumes all the characters of a suppurating chancre; and if this should prove to be the case there is no application so generally useful as iodoform. What Lanceraux says of the value of iodoform in the treatment of the soft chancre will almost, *mutatis mutandis*, apply to the virulent bubo with an ulcerated gland:—"Cette substance, dont l'usage est recent, peut être regardée en quelque sorte comme le spécifique de ce chancre, dont elle favorise la cicatrization et amène sûrement la guérison sans occasioner la moindre douleur. Je possède plusieurs faits qui ne laissent aucune doute à cet égard. Le chancre, saupoudré avec la poudre fine de l'iodoforme, cesse de s'étendre, puis au bout de quelques jours la couche grisâtre qui le recouvre disparait, des bourgeons charnus apparaissent, la plaie spécifique est transformée en une plaie simple qui ne tarde pas à se cicatriser. L'iodoforme détruit, sans aucune doute, les germes ou organismes qui constituent et entretiennent le chancre vénérien."

It is a good plan to give a grain of iodoform internally three times a day, combined, if other things indicate it, with a grain of reduced iron, while using it as a local remedy.

The Sympathetic Bubo.—This bubo may accompany a gonorrhœa or a soft chancre, or may be caused by a tight boot, or it may be more directly traumatic in origin, but the treatment is not affected by the diversity of its cause. This variety of bubo is, in a word, a simple adenitis, sometimes terminating in resolution, sometimes going on to suppuration, and the object of treatment is at first to induce resolution, and next, if this prove impossible, to promote suppuration. The best mode of proceeding with these cases is to apply a compress of lint soaked in a strong lead and spirit lotion, and kept in firm contact with the groin by a tightly-drawn spica bandage or well-fitting truss. Rest is also an essential element in the treatment.

If, in spite of this, the gland continues to enlarge, though without much pain or any throbbing, I am in the habit of injecting five or six minims of the simple tincture of iodine into the substance of the gland, and generally find that this treatment either succeeds in dis-

persing the tumour, or so accelerates suppuration as to make quick work of the resultant abscess. In cases where the gland becomes very large and hard, this plan is better than mere blistering, or than the application of a solution of the mercuric chloride to a previously-blistered surface. When suppuration has taken place, the abscess should be freely and early opened, and the patient enjoined to rest, and to syringe the sac of the abscess twice a day with some stimulating lotion. The injections of iodine may, if necessary, be repeated twice or thrice a week.

ABSTRACT OF REPORT OF THE ROTUNDA HOSPITALS FOR THE YEAR ENDING FIFTH NOVEMBER, 1876. (a).

By Lombe Atthill, M.D., Master of the Hospital.

Part I.—The Lying-in Hospital and Extern Maternity.

During the year ending 5th November, 1876, 1,047 patients were delivered in the hospital. Of these :—

59 were delivered with the forceps.
11 by version.
1 by the cephalotribe.
9 cases of twins occurred.
28 „ of breech or feet presentation.
4 „ of the hand or shoulder.
4 „ of face presentation.
12 „ of prolapse of funis.
2 „ of placenta previa.
18 „ of accidental hæmorrhage.
21 „ of *post partum* hæmorrhage.
8 „ of adherent placenta, requiring the introduction of the hand.
1 case of rupture of the cervix.
1 „ of rupture of the uterus, and
2 cases of convulsions.

The forceps was applied fifty-nine times, or once in about every 17 cases. No fixed rule was laid down with respect to the application of this instrument. In about one-fifth of the cases the os uteri was not completely dilated. Barnes's long double-curved forceps were almost invariably employed. Indeed, the short straight forceps were never used, except on one or two occasions, when the head being delayed at the very outlet by inertia, I applied it, with the sole object of showing the class the mode of doing so. Barnes's forceps are, in my opinion, so superior to any others for facility of application, lessened liability to slip, and greater power, that, while admitting that the short straight forceps (known in this city as Beatty's forceps) are quite sufficient to effect delivery in many cases where the head is low, it will, I am convinced, as prejudice subsides, entirely supersede the latter instrument.

CEPHALOTRIPSY.

In the single case in which the cephalotribe was used, the fact of the pelvis being under the average size having been demonstrated by the result of three previous labours, in all of which the child had been lost, I decided, in the hope of saving its life, to attempt delivery, on this occasion by version, with the most unfortunate results. Version was accomplished without much difficulty, but all the efforts which could, with safety, be exerted by myself and Dr. Macan, failed to bring the head through the brim; these efforts were continued for fully fifteen minutes. The child was then evidently quite dead, pulsation in the funis having ceased for some time. I, therefore, perforated behind the ear, applied the cephalotribe, and finally, with difficulty, extracted the head; the mother died. The child was very large, weighing, after evacution of the brain, upwards of 9 lbs.; had the child been of average size, possibly my efforts to save its life might have been successful, but the result of the case has had the effect of confirming my previous experience—namely, that turning in cases in which the pelvis is undersized is a proceeding of a very hazardous nature, and my opinion is adverse to its practice.

The deaths during the year were numerous, numbering in all 35, which may be divided into four classes.

Class 1.—Eight cases. Deaths directly traceable to the nature of the labour.

Class 2.—Eight cases. Deaths resulting from or supervening on diseases contracted before admission into hospital.

Class 3.—Eight cases. Deaths occurring in patients suffering from extreme mental distress.

Class 4.—Eleven cases. Deaths not traceable to any predisposing cause.

The cases comprised in the 3rd class, namely, those suffering from mental distress, deserve special attention, the majority of these were unmarried; the deaths among women of this class are always numerous, and consequently, for the future, as has been been the case during the last fifteen years, tend to render the mortality of the hospital relatively greater than formerly. Twenty years ago the number of patients admitted into the hospital was, on an average, 2,000 annually; now the deliveries do not much exceed 1,000. But now, as then, it is the great refuge for the very poor and the wretched. The condition of the working classes has materially improved in Dublin of late years, and the majority of the wives of the artizan class now remain in their own homes for their confinements. But it is always among the very poor and wretched that the majority of deaths occur, and they now form the great bulk of our intern patients. In the 4th class I have placed those in whom no predisposing cause appeared to exist. This class includes eleven cases, but of these some might fairly have been placed in the second class. Thus, case 4 was 56 hours in labour; case 9, 52 hours in labour, and was then delivered with the forceps; case 5, 40 hours in labour—very delicate previously; case 7, child putrid—had been in bad health for a month before her confinement. But as in none of them did the evidence of there being any sufficient predisposing cause to account for the fatal result seem satisfactory to me, I have placed them in class 4.

It is remarkable that out of the eleven cases comprised in this class, no less than six were due to septicæmia and one to pyæmia. Of the remaining four, one died of bronchitis, and one of pneumonia; two only of true puerperal peritonitis. Of these, one was a very delicate woman, her labour was very tedious (40 hours).

On considering the details of all the foregoing cases, and watching them as I did closely during life, I have come to this conclusion—that the great majority of the fatal cases recorded were due to septicæmia—most of them, if not all, being auto-generic. That puerperal fever in some of its forms is infectious is beyond all doubt. But I do not believe that form of the disease which is due to self-infection, and which in my opinion, is the most common of all, to be so. Nor am I satisfied that among the fatal cases enumerated above, anyone died of disease contracted in, or of infection emanating from, or present in, the atmosphere of the hospital.

A few words as to treatment. We tried various drugs with very nearly the same result, and that was altogether unsatisfactory. The hypo-sulphates and sulpho-carbolates when borne, seem to do good, but they were seldom, in bad cases, tolerated; frequently they were either vomited or induced purging, and had to be omitted. Sometimes quinine in full dose (5 to 10 grains), in combination with opium, agreed; but with the exception of opium, I have little faith in drugs in the treatment of any of the forms of puerperal fever; and of all means of administering opium none can compare with the hypodermic injection of morphia.

(a) Read before the Dublin Obstetrical Society, June 16th, 1876.

Packing was tried in five cases, in four it gave relief. In one it produced symptoms of collapse; from this the woman rapidly rallied, and subsequently experienced great relief from the distressing thirst from which she had previously suffered. None of the patients, however, were permanently benefited. It is right, however, to add that it was not only tried on patients whose condition afforded very faint hopes of recovery.

The process was carried out by placing the patient on a dry blanket, and enveloping her from head to foot in a sheet wrung out of cold water; this was frequently changed, the process being continued for about twenty minutes, the temperature being taken both before and after the packing.

The perchloride of iron was twice injected for the arrest of *post-partum* hæmorrhage; both patients recovered. Our experience of this method of treating *post-partum* hæmorrhage is very favourable.

It has been the practice in the hospital for several years past, to administer a dose of ergot of rye just before the terminations of labour, in all cases where the occurrence of *post-partum* hæmorrhage was anticipated; and also in cases of tedious or difficult labour requiring the use of the forceps, before the patient was put under the influence of chloroform, chloroform being always administered in instrumental cases; but the ergot often failed to be good, sometimes because it was vomited, sometimes doubtless because the drug had not time to be absorbed into the system, and so to produce its specific effects. I must, however, candidly say that I place no reliance in ergot in cases of *post-partum* hæmorrhage, at least when administered by the mouth. I have, therefore, for a long time past, had recourse to its hypodermic injection, diluting the extractum ergotæ liquidum with an equal part of water, and injecting twenty or thirty minims of this solution deeply into the substance of the gluteus muscle. I have no doubt but that, so employed, ergot is more energetic than when administered by the mouth; moreover it produces its effects much more rapidly.

Ether was injected hypodermically in several cases; in one or two it produced marked improvement in the pulse and the patient rallied wonderfully; in others it seemed to produce but little effect. It is, however, a perfectly safe remedy, and one which should be had recourse to in all cases of collapse.

In cases of rigid os uteri we rely altogether on warm hip-baths, and on the administration of the hydrate of chloral, giving usually 10 grains of this drug in an ounce of fluid every twenty minutes till 40 or 50 grains have been taken.

EXTERN MATERNITY DEPARTMENT.

For the following tables I am indebted to Mr. Dobbs, clinical clerk:—

Number of natural labours	547
Difficult, complex, or preternatural	56
Abortions	35
Total	638
I may here point out that the number of patients attended in their own homes during the preceeding year was only	275
Thus, there was as a result of the new arrangements an increase in the year of	363
Of presentations of the upper extremity there were	0
Of presentations of the lower extremity there were	19

COMPLEX CASES.

Prolapse of funis		3
Hæmorrhage	*post-partum*	16
	accidental	6
	unavoidable	2
Twins		9
Convulsions		1
Rupture of uterus		0
Prolapse of uterus (*a*)		1
Retained placenta		11

(*a*) The os uteri was outside the vulva before labour set in and during its progress.

ABNORMAL CONDITIONS.

Anencephalous monster	1
Mole pregnancy	1
The forceps was applied sixteen times, namely—	
For prolapse of funis	1
For tedious labour	15
Version performed three times—	
For presentation of funis	1
For placenta prævia	2
Perforation and cephalotripsy	1

A. F. Dobbs, Clinical Clerk.

November 9th, 1876.

ON A CASE OF PSORIASIS, TREATED BY CHRYSOPHANIC ACID.

By J. C. Ogilvie Will, M.D.,
Surgeon to the Aberdeen Royal Infirmary.

In the *British Medical Journal* for Dec. 23rd, 1876, Mr. Balmanno Squire directed attention to the treatment of psoriasis by the external application of chrysophanic acid, a substance obtained from Goa powder. The results following its use in the case he narrated, and in others subsequently described, induced me to prescribe it in a case lately under treatment in the Aberdeen Royal Infirmary; and as it seems to me to be a striking example of this simple mode of treating a decidedly intractable affection, I think a notice of it may prove not uninteresting.

J. W., æt. 14, was admitted on April 25th, 1877, suffering from psoriasis. His arms, thighs, and legs were covered with innumerable scaly patches, varying in size from a minute point to that of a shilling, and presenting the characteristic appearances of *P. punctata*, *guttata*, and *nummularis*, most marked on the extensor aspects, but also involving a considerable extent of the flexor aspects. His chest, abdomen, and back were very plentifully studded with nummular patches, and his scalp was in a similar condition. He complained of intense itchiness.

On April 28th chrysophanic acid ointment—fifteen grains to an ounce of hot lard—was prescribed, directions being given that it should be well rubbed into the affected parts night and morning. Three days afterwards the scales were peeling off freely, and the itch had ceased. On May 3rd the scaly patches had completely disappeared from the greater portion of the surfaces involved, and the infiltrated cutis was fast resuming its normal consistence. On May 7th the whole body was perfectly free from scales, and was dyed of a dusky purple colour; while the spots where the disease had existed, presented a smooth, white appearance, forming a marked contrast to the surrounding discoloured skin. The head was shaved on May 3rd, for the purpose of allowing the application of the ointment to the scalp; but the shaving caused so much irritation that the use of the acid was delayed until May 9th, when it was applied, the effects on the eruption being similar to that seen on the body. On May 10th the epidermis covering the unaffected portions of the body was found to be exfoliating, the whole surface being covered by fine furfuraceous scales; but after the use of warm baths the skin speedily became perfectly normal in appearance, no trace of disease remaining. For the purpose of observation, the patient was kept in hospital for some time longer, and on one occasion it was deemed expedient to re-apply the ointment to his back, which presented a somewhat suspicious appearance; but on June 4th he was dismissed with a perfectly healthy skin. As a precautionary measure, he was directed to take small doses of Fowler's solution for a few weeks.

This case was undoubtedly an aggravated example of the disease. It is not our usual custom to admit patients suffering from skin affections, but this one was so typical,

that I regarded it as a favourable opportunity for the students becoming acquainted with the clinical features of psoriasis, and I therefore requested the patient to remain in hospital.

Remarks on the progress of the case while under treatment seem superfluous, but it must, I think, be allowed that the result of the acid was marked and satisfactory. At the time when it was prescribed I said that I had but little faith in it, while I had every confidence in arsenic, if given in large enough doses; for though psoriasis is a very common affection in this neighbourhood, I have never yet seen a case which ultimately resisted the internal administration of that remedy. But experience has taught me that, to be of real use, arsenic must be given freely. As examples of this, I may mention that during last year in three cases no benefit was obtained until the patients were taking from twenty-five to thirty minims of the liquor three times a day; but after improvement once set in, progress was rapid. Still the free use of arsenic has its disadvantages; for disturbance of the digestive tract, and puffiness of the face, sometimes comes on very suddenly, and gives considerable trouble and annoyance, while some persons cannot take it at all, the smallest dose giving rise to sickness and distaste of food, and to swelling of the face, hands, and feet, symptoms which continue until the administration of the drug is entirely stopped. Tarry applications are much in vogue, and are often useful, especially oleum cadinum; but their curative action is slow and somewhat uncertain. Therefore, the introduction of a new remedial agent, apparently possessing the power of effecting a cure in a short space of time, seems a real gain; and if more extended trials are followed by equally beneficial effects, there is every reason to believe that chrysophanic acid will soon be regarded as the most reliable and quickest method of treating psoriasis. (*a*)

It has one disadvantage, however, which renders its use rather objectionable in private practice—viz., that it stains the clothing of the patient and bed-clothes a purple colour, which will not wash out; but it may be reasonably expected that some means may be devised by which this may be overcome.

When prescribing chrysophanic acid, it is a wise precaution to warn the patient against allowing it to come in contact with the eyes, as it gives rise to intense irritation, accompanied by great dilatation of the pupils. This I have seen thrice—once in a case of psoriasis rupoides (at present under treatment), and twice in cases of favus, where I may mention that the acid proved useless. The irritation subsides spontaneously in the course of a few days.

(*a*) Since this article was written I have used chrysophanic acid in two additional cases of psoriasis with perfectly satisfactory results.

Clinical Records.

ST. THOMAS'S HOSPITAL.

Two Cases of Strangulated Femoral Hernia successfully treated by Operation; One in which the Sac was opened; the other, Extra-Peritoneal.—Practical Remarks.

Under the care of Mr. Francis Mason.

[For the Notes of these Cases we are indebted to Mr. W. A. Cowen and Mr. Cream, dressers.]

A. A——, a widow, aged 66, was admitted under Mr. Mason's care May 26th, 1877. The history she gave was that she had had a swelling in the left femoral region for about twenty years. It increased in size when she exerted herself, but when she assumed the recumbent posture it disappeared to a great extent, but not completely. She had never worn a truss, and was ignorant of the precise nature of the enlargement. Although by no means a robust woman she stated that she enjoyed, as a rule, fairly good health. Six days previous to her admission, the swelling suddenly, and without any distinct cause, increased in size, and became exceedingly painful. She was advised to try and push it back, but failed in the attempt. In the course of the night she suffered from nausea and retching; and from that time—on a Monday—to the date of her admission, on the following Saturday, there was no satisfactory action of the bowels. On two occasions she had a spurious diarrhœa.

On admission there was an elastic tense swelling situated in the left femoral region. The least pressure caused great pain. There was no impulse on coughing. During the examination the patient had paroxysms of violent retching; and once after her admission the vomit was stercoraceous. The skin was bathed in clammy sweat, and the pulse was fairly strong, beating 120 in the minute. About an hour after her admission she was seen by Mr. Mason, who, on due consideration, decided on operating. The patient was, therefore, removed to the theatre, and, under ether, Mr. Mason, having first employed moderate taxis, made a vertical incision through the skin by transfixion over the neck of the sac. Each delicate layer of structure covering the sac was divided, and the sac reached. Guided by the finger-nail the hernia knife was carried in the direction of the neck of the sac, and an incision made with it slightly upwards and inwards. The incision, however, was insufficient to enable the rupture to be returned, and, therefore the sac was carefully opened. The intestine was found to be of a dark colour, and much congested, but not in the least gangrenous; and there was a piece of omentum, the size of a small orange, in the sac. One touch of the knife, applied in a direction upwards and inwards, released the strictured intestine, for, by raising the left leg so as to relax the parts, the gut was easily pushed back into the abdominal cavity. The omentum was tied in different portions with carbolised cat-gut, and then cut off with scissors. The wound was closed with silk sutures, and a bandage having been applied, the patient was removed to bed.

The patient progressed most favourably, sleeping well immediately after the operation. No opium was administered. The retching and vomiting entirely ceased. On the 27th of May (the day after the operation) the temperature was 98·2; and on the following day, 100·3. On the 29th, temp. 98·4; but after that time she went on without a single symptom worthy of record. The bowels were relieved naturally on the fourth day after the operation, and there was slight diarrhœa for a day or two afterwards. On June 26th the patient was quite convalescent, and remained in the hospital only for the purpose of having a truss fitted.

The second case is one in which the sac was not opened. The patient was a woman, aged 65, who was admitted into Elizabeth Ward under Mr. Mason's care on June 23rd, 1877, with a strangulated femoral hernia of the right side. This patient had never worn a truss, and was not aware, until the day of admission, that she was the subject of rupture. She stated that without any cause whatever a swelling came in the "upper part of her right thigh." This was succeeded by an attack of persistent vomiting, which led her to seek for advice. Her medical attendant at once recognised a hernia, and without making any special attempt at taxis, transferred her to the hospital. On her admission, Mr. Mason happened to be in the building, and, on examining the affected part, found a very tense swelling in the right femoral region. The patient was at short intervals very sick, the vomit being markedly stercoraceous. Her pulse was feeble, and she was very prostrate.

An operation being considered imperative, Mr. Mason, after having used moderate taxis, made an incision, as in the last case, by transfixing the skin over the neck of the sac. The sac was reached, and the constricted part divided in a direction upwards and inwards. On raising the leg the hernia was readily returned. No ligatures

were required, and the wound was closed by silk sutures, after which a bandage was applied.

In the after treatment this patient made excellent progress. No opium was given. Her temperature kept about normal. Soon after the operation the vomiting ceased, and she was enabled to take some beef-tea, with a little brandy. On the third day (*i.e.*, June 26) there was considerable pain in the abdomen, with a threatening of peritonitis. This was speedily alleviated by the application of a paste made of equal parts of extract of belladonna and glycerine spread on lint. There was no action of the bowels until the thirteenth day after the operation, when, inasmuch as the patient complained of some abdominal discomfort, a simple enema of warm water was administered. From that time up to the present (July 20) she has gained strength daily. The wound is healing well, and excepting that she had a slight attack of diarrhœa, which was readily checked by a little chalk mixture and opium, she may be considered convalescent.

Remarks.—In referring to these two cases, Mr. Mason took the opportunity on one occasion when visiting the wards, of saying that there were in them several points of practical interest, and that they were cases from which much might be learned, although there was nothing specially sensational or remarkable about them. It was curious, said Mr. Mason, that in the first case, although the patient knew she had rupture that she should never have worn a truss; in the second case, the woman was not even conscious of having a hernia, and according to her own statement had not exerted herself, nor had she done anything to induce the descent of the bowel. It was common to find that patients wore trusses which were ill-fitting, and which in fact did more harm than good, yet many of such patients were perfectly satisfied so long as a truss of any kind were on them. It acted as a species of amulet to ward off harm. Next there was the question of operating, and Mr. Mason dwelt most particularly on the importance of acting with decision in such cases. It was perfectly well known that when symptoms of strangulation had fairly set in that delay in operating was most dangerous. Operative interference was especially demanded in femoral hernia, in which the constriction was formed chiefly of unyielding fibrous structures. Then with regard to the method of operating, it was almost accepted at the present day that the best practice was to operate without opening the peritoneal sac, because there was less chance of exciting peritonitis. Yet Mr. Mason expressed a decided opinion that there was no more pernicious practice than that of making prolonged attempts to reduce the hernia in extra peritoneal operations. Incalculable mischief was the result of the bruising inseparable from such a procedure. Hence, Mr. Mason's plan was first to attempt reduction without opening the sac, using moderate force only, and dividing somewhat freely such structures as interfere with the reduction. If these means fail he then had no hesitation in carefully opening the peritoneum.

The operation in which the sac is opened had (he remarked) certain advantages, for the condition of the protruded intestine, as well as the contents, could be ascertained. In the first case there was a large portion of omentum to be dealt with. Inasmuch as there were no adhesions, this might either have been returned, or it might have been allowed to remain in the sac, or it might have been removed. Mr. Mason stated that he had had several cases of this kind, and, following his usual practice, he cut off the greater part of the omentum, leaving a short stump, which formed a very efficient plug to act as a barrier, and thus prevented, as was subsequently found in this case, a further protrusion of the intestine. Mr. Mason then briefly referred to the direction of the incision, which should be upwards and slightly inwards, and *not directly inwards*, and spoke of one case that he had had an opportunity of seeing after operation, in which Gimbernat's ligament had been so very freely divided in the inward direction, so that no truss could be found to retain the hernia in position.

Lastly, Mr. Mason alluded to the importance of the surgeon not being too anxious as to the speedy action of the bowels, and explained that when the intestine had been tightly constricted for a time its function was necessarily suspended. Time alone, in most cases, was all that was required, and should there be much discomfort or tympanitic distension, an enema of warm water would give relief. Purgatives at such a time were not to be thought of. These were just the cases in which, after the surgeon had done his part, the after-treatment might in many instances be safely entrusted to Nature.

THE REMOVAL OF ADHERENT PLACENTA FROM THE UTERINE CAVITY.

By Charles W. Hamilton, L.R.C.S.I.,
Medical Officer and Admiralty Surgeon at Achill.

(*Continued from page 490 in our last volume.*)

Case IV.—I attended Mrs. T. in the month of March last, as she had been under my observation previously. I was not surprised to find her abdomen immensely enlarged, and her lower extremities swollen and œdematous. The abdominal enlargement was also irregular in outline. She was unable to stand, or in any way use her legs, so great was the œdema. Tedious labour set in, and after some hours, a breech presentation could be diagnosed. In due time I delivered her of a still-born child. Considerable difficulty was experienced in extracting the head, which, I believe, arrested fatally the flow of blood in the funis. My patient had been now very much exhausted. After half-an-hour, and having convinced myself that another child, at least, remained in utero, I administered a few doses of ergot, which brought on some very weak pains, which, however, had had the effect of bringing the presentation to the brim of pelvis. The pains then ceased, so I put on the long forceps and delivered her of a living male child (a cephalic presentation having occurred). My poor patient now seemed entirely worn out; so I re-adjusted the binder which was applied after the delivery of the first child, and administered some brandy, with opium. Having somewhat rallied, I made traction on the cords separately, and then I suspected adherency.

Two hours after delivery of the second child, having satisfied myself that no more remained in utero, and having fairly tried every means of detaching the placentæ, I saw no other course to adopt, considering the state of the patient, than to pass my hand and arm into the uterine cavity. I found the uterus so much enlarged that I could not sufficiently grasp either placenta, being situated at the extreme end of fundus. I had, however, pressure applied externally, insinuating my fingers, with the back of my hand closely applied to the uterine wall, at the edge of the placental mass, and with a sweeping movement from left to right—the fundus having been well pressed down externally—I happily succeeded in detaching the entire mass, having the latter now in the bend of my wrist. I ordered her to be given a dessert-spoonful of brandy, and ℥ xxx. ʒss. of tinct. opii, when the uterus contracted, and expelled the mass, also my hand. She, and her child, are now quite well; the former having attended church, a distance of six miles, one month afterwards.

I will, with this case, conclude this important subject: Mrs. G. (Case III.), has, since the publication of these cases, fallen a victim to an epidemic of malignant fever, which unfortunately occurred during her convalescence.

Remarks.—Had I failed in Case IV. to remove the placentæ at the first attempt, I do not believe I could have made a second, as the patient was in a sinking state. Grasping each placenta separately, and twisting or tearing it away, could hardly be accomplished at the *one* introduction—*i.e.*, applied to both—as the poor woman could not have borne a *prolonged* primary, and certainly *not* a *second* introduction. The hand might also get quite benumbed and powerless, and thus cause failure at the

first attempt. The physician is thus placed in a dilemma, and in such "*rare*" cases (as stated in the preface to this contribution) "where the *entire* removal of the placenta would be followed by almost certain death to the patient, it may be left, and means taken to assist nature in its expulsion, and that a good recovery may follow." Of course, when hæmorrhage complicates the case, the treatment would not be applicable.

BRITISH MEDICAL ASSOCIATION.

Forty-Fifth Annual Meeting.

[From Our Special Correspondent.]

(*By Telegraph.*)

Victoria Park, Manchester,
Tuesday, August 7th.

From the interest taken by the local secretaries and the leading members of the profession in Manchester, this meeting promises to be a most successful one; and though visitors may not derive much scientific *benefit*, yet they will be able to enjoy themselves, to unbend the strain of professional work; whilst the social intercourse, the friction of so many different minds, must have a healthy influence, and be productive of some good. If the Association had only been designed for pleasure—for *soirées*, receptions, dinners, garden parties, excursions, — it would deserve support, for the average general practitioner has but few opportunities of indulging in such relaxations, and during the present meeting the programme looks very tempting.

The members of the profession in Manchester are men of education, and of broad and liberal views. They are courteous and hospitable, and the visitors, who are constantly arriving, will find that their "lines have fallen in pleasant places;" whilst for the lay public, I need hardly dilate on their world-wide reputation for those virtues so prized by the ancients, and the profession is receiving at their hands all the respect and attention that could be desired even by the most fastidious.

The greatest difficulty for the visitor will be to economise time, so as to condense and digest the mental pabulum offered him, and also to arrange for the inspection of hospitals, public buildings, warehouses, manufactures, and last, not least, for luncheons and dinners. The members of the Association will have an excellent opportunity of encouraging the total abstinence movement; for—as the power of example is very great, and practice is better than precept—I have no doubt a great impetus and encouragement would be given to the crusade against intemperance by a public dinner of the Association without the usual concomitants of alcoholic drinks. A great number will abstain for this reason, but many will prefer the medium course of temperance. Dinners without wine are generally supposed to be dull, the social influence of sparkling wine has long been recognised; it unbends, inspires, exhilarates, promotes the flow of conversation, and I suppose it would hardly be the correct thing to toast Her Gracious Majesty the Queen in water. This is, perhaps, only a habit, custom, or fashion about which it would be well if we could say it was more honoured in the breach than in the observance. Happily for his digestion, the visitor will not be able to attend all the luncheons or dinners, and he will have to select from the very varied programme what places to visit.

For some, the magnificent warehouses and cotton mills—those teeming hives of human industry which have made Manchester so rich and famous—will offer attractions, whilst the purely scientific will find ample work in inspecting the hospitals, of which there are a goodly number (Royal Infirmary, St. Mary's Hospital, Sick Children's Hospital (Pendlebury), Royal Eye Hospital, Clinical Hospital, Manchester Southern Hospital, &c.); whilst Owens College, with its school of medicine, its museum, its physiological laboratory, will form a centre of interest from which most will not feel inclined to wander, and where the principal work of the Association is to be carried on, though there is a reception-room at the Concert Hall, Oxford Street, for the convenience of members.

The week's work is thus cut out:—

Tuesday, Aug. 7.—Meetings in Concert Hall.

11 a.m.—Service at the Cathedral; sermon by the Lord Bishop of Manchester.
12.30 a.m.—Meeting of Committee of Council.
2 p.m.—Meeting of Council, 1875-76.
3 p.m.—General meeting. Address by M. A. Eason Wilkinson, M.D., President. Annual report of Council and other business.
9 p.m.—Reception and *soirée* by the President of the Association, and the Council and Senate of Owens College.

Dr. A. Ransome will give an address on the "Present Condition of State Medicine in England."

Wednesday, Aug. 8.—Meetings in Owens College.

9.38 a.m.—Meeting of Council, 1876-77.
10.30 a.m.—Second general meeting.
11.30 a.m.—Address in medicine by W. Roberts, M.D.
2 to 5 p.m.—Sectional meetings.
9 p.m.—*Soirée* by the Mayor and Corporation of Manchester at the Town Hall.

Thursday, Aug. 9.—Meetings in Owens College.

9 a.m.—Meeting of the Committee of Council.
10 a.m.—Third general meeting. Reports of committees.
11 a.m.—Address in Surgery by Spencer Wells, London.
12.30 p.m.—Demonstration by Dr. Sayre, of New York; of his method of treating curvature of the spine (lecture theatre of medical school).
2 to 5 p.m.—Sectional meetings.
6.30 p.m.—Public dinner of the Association in the Assize Court Hall.

Friday, Aug. 18.—Meetings in Owens College.

10 a.m.—Address in Obstetric Medicine by R. Barnes, M.D., London.
11 a.m.—Sectional meetings.
1.30 p.m.—Concluding General Meetings. Reports of Committees, &c., &c.
4 p.m.—Garden party by President and reception committee at Manley Hall.

Saturday will be devoted almost exclusively to excursions, as Macclesfield, Lancaster, Woodhead Water Works, Northwich, Castleton, Southport, Blackpool, and Messrs. Cook and Sons have organised a tour of seven days through the English Lake districts. I can recommend the excursion to Castleton; it will be personally conducted by Prof. Boyd Dawkins, and as he will give a short address on the recently discovered Cave deposits, the interest of the visit will be very much enhanced.

"Comparisons are odorous," and how shall I decide on the rival merits of Southport and Blackpool. The medical men of Southport invite a hundred members, and can show them an aquarium, winter gardens, pier, glaciarium, and new sewage works. It is situated 32 miles from Manchester. The climate is bracing and sedative, the air dry, but not irritating. Fogs are very rare, and the atmosphere is light and pure. As a summer and autumnal residence Southport is useful in laryngeal, bronchial, and pulmonary affections; in tuberculosis; in dyspnœa with constipation and flatulence; in chronic rheumatism; in some forms of paralysis; and in nervous depression after long illness. The mayor and corporation of Blackpool have invited as many members as choose to go, and will entertain them. Blackpool is more bracing, has a better sea, and the pier, promenade, recently extended, are well worth seeing.

The special subjects for discussion in the several sections are as follows:—

Medicine.—Aortic aneurism; the treatment of pleuritic effusion.

Surgery.—Antiseptic surgery; excision of the knee; treatment of stricture of the urethra.

Obstetric Medicine.—Transfusion of blood.

Public Medicine.—Hospital Out-Patient Reform. The Contagious Diseases Acts.

Psychology.—The best method of treating habitual drunkards.

THE MEDICAL PRESS AND CIRCULAR has had several good articles lately on this last subject, and I hope the writer of them will be present to further diffuse his opinions. The list of papers to be read is very long, and as by the rules of the Association all papers read become its property, the Journal will be well provided for during the ensuing year. *Apropos* of the Journal Dr. Haddon, of Monk's Hall, Eccles, has given notice that he will move—

"That a committee be appointed, consisting of members eminent in the several departments of medicine, surgery, midwifery, &c., who shall endeavour to make the journal a perfect epitome of the science, as well as the practice of medicine; and at the same time utilise the members in clearing up disputed points in the diagnosis or treatment of disease, so as to increase the value of the journal, and, if possible, raise it to a higher place in the medical literature of the day. Such committee to be responsible for the management of the journal and any correspondence admitted to its columns."

The day has opened unpropitiously so far as the weather is concerned. The proceedings were virtually inaugurated by a sermon from the Lord Bishop of Manchester, who took for his text—St. John's first Epistle, chap. iii., verse 2., "It doth not yet appear what we shall be."

The cathedral was well attended, and though our profession is accused of heterodoxy, I doubt whether his Lordship had ever a more attentive or intellectual audience. There is nothing of general interest about the meeting of council or committee; and it is impossible to condense for this week the president's address, which was both able, interesting, and fully worthy of his high reputation.

The exhibition of medical and dietetic plants at the Botanical Gardens is very interesting.

The *pièce de resistance* for this day will be the *soiree*, given by the President, at 9 p.m., an extremely interesting feature of which will be a collection, arranged by Professor Boyd Dawkins, illustrating the history of man in Britain from the Pleocene to the Historic period.

There will also be a series of fossils showing the ancient carboniferous flora of Lancashire.

The Mayor and Corporation will give their *soiree* at their new Town Hall, which has been in course of construction for the past eight years, and has cost nearly £1,000,000.

It is said to be probably the finest building of the kind in the world; its splendid architectural proportions and magnificent decorations will be highly appreciated by all lovers of the fine arts.

I will send a special report on new instruments, surgical appliances, and sanitary contrivances.

THE death-rate in the four principal cities of the United Kingdom last week was—Edinburgh, 16; Dublin, 18; London, 21; Glasgow, 21 per 1,000 of the population. In the second category, Wolverhampton was lowest with 15, Salford highest with 27 per 1,000 of the population.

THE deaths from small-pox still further declined in London last week, the official returns giving 17 deaths in public institutions and 10 in private dwellings. Thirteen were certified as unvaccinated, 4 vaccinated, the remaining 10 no certificates were given as to vaccination.

REGISTERED FOR TRANSMISSION ABROAD.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 8, 1877.

HOME HOSPITALS FOR THE MIDDLE CLASSES.

WE have just received the prospectus of the Invalid's Home Association, the object of which is to establish home hospitals for the middle classes. We have on a former occasion expressed our approval of this undertaking, and remarked how desirable it is that the advantages attached to our large hospitals should be brought within the reach of those who cannot command at their own homes all that is necessary for their proper care and treatment, and yet are too well off and too independent to become inmates of the hospitals provided for the relief of the poor. For a long time both the public and the profession have felt strongly the want of Institutions in which, for a certain weekly payment, the middle-class invalid could place himself in a position most favourable to his recovery, and where he might even remain under the care of his own medical attendant. The movement has received great and general support, and we have annexed to this prospectus a medical memorial in favour of the association, signed by upwards of 200 of the best-known members of the profession, as well as a lay memorial endorsed by a number of leading lawyers, bankers, merchants, &c. The only thing, therefore, that remained to be considered was the best way of carrying out the scheme, and finding sufficient funds to meet the primary outlay for the requisite buildings, furniture, and other appliances. At first it was proposed to form a company or association on the limited liability system, and to carry out the objects in view on strictly commercial principles, but now it would appear that this scheme has been abandoned for another, to which some objections will probably be made, which may even jeopardise the success of the undertaking, and prevent the very people taking

advantage of the proposed institutions, for whose special benefit they are projected. In order to provide the funds for the primary outlay, the provisional committee have decided to make an appeal to the public for about £20,000. Taking as their model the principle laid down in the governorship of some of the public schools, they intend to solicit contributions, either as subscriptions conferring certain privileges, or as free gifts. They propose :—"That every contributor of fifty guineas and upwards shall be regarded as a governor of the asssociation, with the privilege (1) of serving on the committee of management; (2) of nominating patients with priority of admission; and (3) of priority of admission, if necessary, for themselves and families. A donor of twenty guineas and upwards will possess the privilege of nominating one patient annually, and of priority of admission for himself. At the same time "it is regarded as essential to the success of the proposed association that the institution shall be self-supporting." It will be seen, therfore, that the plan they have agreed upon is one in virtue of which the home hospital will neither be a self-supported one, nor one supported by voluntary contributions. It is, in fact, to be *founded* by voluntary contributions, and *supported* partly by the payments of the patients, and partly by the public. This, unless we are mistaken, is a correct interpretation of the scheme as indicated by the published prospectus of the association. Now there can be no objection to a scheme of this kind being carried out, partly on the public subscription, partly on the self-supporting principle, provided that the principle is not acted upon in such a manner as to clash with the general aim and objects of the association.

The promoters of this movement, which is intended to meet a real public want, doubtless saw many difficulties in the way of effecting their purpose by forming a company. It is probable that had that plan been adopted the necessary funds would not be found to flow in very quickly, as this is not an undertaking in which the public would be likely to invest their money with a view to profit. But what the public would not do for the sake of speculation, they often will do out of charity, and in furtherance of a movement by the success of which they may themselves one day be personally benefited.

We can therefore find no fault with the scheme as a whole; but the privileges which they propose to confer upon the donors are open to criticism, for these privileges would in time create a monopoly which would operate very unfavourably upon that class of patients for whose benefit these institutions were ostensibly established; and instead of being open to all comers who could afford to pay for the accommodation they required, the wards would be closed to many who were not furnished with a nomination. But it is evident that people who could afford to pay two or three guineas a week, or even more for their residence, &c., in one of these home hospitals, would neither like to beg *in form pauperis* for a hospital "letter," "nomination" though it be called, nor would they like to see the room for which they were ready to pay the stipulated fees, monopolised by some dependent nominee of a rich donor, and whose case perhaps was far less urgent than the one which it excluded. If these privileges were confined to the original donors, whose money had mainly contributed to the foundation of the hospital, and to the defraying of the first outlay incurred, nothing could be said against them, for as these donors died off the institution would be left to its own resources, and there would be no one to stand in the way between the sick applicant and the home for which he was willing to pay. But there is nothing in the present programme to prevent any one becoming a governor and claiming the same privilege long after the hospital had been put on a self-supporting footing. Hospitals of this kind might become very popular among the wealthy classes, and in proportion as the donors of fifty or twenty guineas increased the more would the admissions into these institutions be restricted by patronage and favouritism, so that even priority of application, readiness to pay the highest fees, and the urgency of the case, might have to give way to the claims of the more fortunate nominee. The result would be that in time these homes would lose their reputation for being to the well-to-do invalid a ready means of enjoying the advantages attached to them, and a feeling of independence would preclude many of those persons applying for admission for whose especial benefit the homes were established. Nor was it necessary that the rich and the charitable should be tempted to come forward in support of this movement by the offer of hese objectionable privileges. There are thousands of the more wealthy classes who are continually giving handsome donations to our different charities without expecting any tangible return for their money. Their donation is a free gift which they think no more of after it is once given, and their after interest in which is very different to what it would be did they look upon it as investment. Indeed, it may be questioned whether they would not gladly dispense with this privilege of nominating patients, for it is well known that the most troublesome part of the duties usually imposed upon a governor of a charitable institution is to attend to the numerous applications they receive for their nominations. It will be seen that the above remarks do not apply to the eligibility of the donors to serve on the committee of management. This is not only a right they may justly claim, but it is a policy which is in the highest degree conducive to the success of the institution. Many wealthy donors would not allow their donations to be the only earnest of the interest they took in the welfare and management of an institution to the foundation of which they had liberally contributed. They might, therefore, wish to be placed on the committee of management, and the propriety of complying with such a wish cannot be for a moment questioned.

There is another point of very great moment in connection with the working of these desirable hospitals. A part of the scheme which has been sanctioned by the numerous representatives of the medical profession mentioned in the "medical memorial" is, to "provide for the assistance of the medical profession and for the benefit of the public a well-regulated hospital to which the former can send with confidence private patients who can afford to pay adequately for the accommodation they require, *and in which the patients will have the advantage of being treated by their own doctor.*" But in the prospectus itself this part of the scheme is not so much as

mentioned among the "aim and objects" of the Association. It is evident that one of the most important points for consideration is, how far this plan is to be carried out, or even whether it should be wholly abandoned, whether the patients are to be under the care of their own medical attendant, or under the care of a staff of physicians and surgeons especially attached to the hospital. It was at first suggested, and we believe it is still in contemplation, that both plans should be adopted in the same institution. But this could never be practically carried out. The great majority of applicants would, for obvious reasons, prefer being attended by their own family medical man, whilst, for equally obvious reasons, the latter would prefer parting with his patient with the understanding that he was to continue in charge of the case. The result would be that either the number admitted under these conditions must be very limited, a provision which would be very invidious and otherwise objectionable, or the patients under the care of their own doctors would become so numerous as to minimise the work of a permanent medical staff to an almost ridiculous extent, besides interfering much with the arrangements and general working of the institution. Space will not allow us to discuss this part of the scheme so fully as we would wish, but it is clear that the idea of allowing patients to be attended by their own doctors must be either given up altogether, or else the professional arrangements of the hospital must be based on the principle of carrying out this plan in its entirety. In the latter case a resident medical officer, a dispenser, and a consulting physician and surgeon would be all the medical staff required, a plan which might be found to work very well. If, however, the other scheme is adopted, and the home hospital is to resemble all other hospitals, with the exception of the superior and more private accommodation offered, and the payment made by the patients, we do not see how any of the latter can be allowed to remain under the care of his own medical attendant.

THE HOMŒOPATHIC SCHISM.

THE number of the *Monthly Homœopathic Review* for August has quite convinced us that it is little better than the pursuit of an *ignis fatuus* to continue our arguments on the subject. We appealed to reason, to experience, to logic, and we are simply met by negations and by the persistent repetition of premises, based on assumption and fallacy, and we now feel assured that we must leave to time alone the disintegration and destruction of the Hahnemannian school.

The discordant elements already entering into the domain of homœopathy, the "tangible dose"-men who resort to the frequent use of aperients, anodynes (of whom Dr. Wyld may be regarded as a type), will slowly, but surely, produce a beneficial effect; and without claiming the spirit of prophecy, should the editors of the *Review* be spared another twenty years, they will find our prediction has become verified, and that pure homœopathy will be only a curiosity of the past.

We have said, at the onset, it was a chimera to entertain Dr. Wyld's well-meaning propositions, as we knew he had no official standing, and that his views would not be adopted by his school; and the truth of this our readers may ascertain by perusing the correspondence of Dr. William Bayes, in the current number of the *Monthly Homœopathic Review.*

We would hardly have again touched on this subject, but for what is termed "a very interesting and suggestive letter" from Dr. Rabagliati (Surgeon to the Bradford Infirmary), addressed to Dr. Wyld, and published in the same columns, by his consent. The spirit which induced him to write this communication may be a very laudable one, but we think he has not sustained his position, and that few practitioners will agree with his conclusions.

We are not allopathists, hydropathists, or "pathists" of any kind. We are not animated by sectarian animosity, and we would at once abandon our position if we had a warranty that a better method was available, and we would advise our readers to at once embrace homœopathy if the weight of evidence was in its favour. We, in common with other medical journals, have followed the movement since 1838; we have read, digested, and analysed the data; and we have come to the conclusion that the Hahnemannian method is incompatible with ours, that there can be no amalgamation, and that homœopathy is based on error. We fail to see how Dr. Rabagliati can logically justify the following lines:—

"It appears to me that if a homœopathic practitioner should wish to see an allopathic, or *vice versâ*, or if the patient attended by the one should desire a consultation with a practitioner of the other school, there are no reasons which ought to continue to prevent the one practitioner from meeting the other and giving the patient the benefit of their joint advice. At least, I for one, am in strong hopes that a sectarian animosity, which should never have arisen, may come to an end some day or other."

HOSPITAL FEES IN DUBLIN.

WE note in another part of our issue the adoption by the hospital physicians and surgeons of Dublin of a compact under which all hospitals are to charge the same, to raise the fee for the nine months' attendance from £8 8s. to £12 12s., and to cease from the present arrangement of admitting pupils to perpetual attendance at a discount off the regular yearly fees.

This is a step which is worthy of notice from many aspects. It is certainly worthy of approval as a movement towards discouragement of underselling. Henceforth the competition which must and ought to continue to exist, will be a competition between hospitals as to which will give the most value to the student and thus attract the largest class, and we are glad that inducements to students to save money by entering at a third-class hospital have ceased to exist. We also cordially congratulate the profession on the abolition of perpetualism. The system under which a pupil, who at the moment of entering knows not what he is doing, was enlisted for four years and obliged to remain at one hospital where he got little teaching was radically bad, and the usual effect of it was that students habitually attended the hospital where they were best taught, although they had paid their money elsewhere. It will now be optional with them to go from or stay at their original hospital at the end of any session, and medical officers will find it urgent upon

them to exercise every persuasion to keep their classes together.

Whether the increase in the fee is just or judicious, is another question. We readily concede that, if a student is to pay heavily, he may more reasonably be asked to pay for his hospital than for any other part of his education; for it is undoubtedly within its walls that he has the chance of learning most. We feel, however, that the increase of fee is one more step towards the break up of the present medico-educational system. A few years since the student obtained all his lectures at £2 2s. per course. The fee was then advanced to £3 3s., and the cost of medical education increased by one-third at one swoop. It has lately been proposed to reduce the number of courses, but to maintain the aggregate fee, so that a lecturer who now receives £3 3s. per course for three courses would then receive £4 4s. and £5 5s. respectively for two courses. The step which we now discuss adds £12 12s. more to the burthen on the student's parent, and raises the cost of medical education to a very serious amount. We should offer no objection to this, because we consider that both the profession and the public would benefit by any move which would tend to restrict admission to our ranks and to increase the monetary reward of professional teachers; but we cannot forget that qualifying and teaching bodies remain, who will gladly give the two courses of lectures for £4 4s., for which others would charge £9 9s., and the same period of what they call hospital teaching for £3 3s. as is now fixed elsewhere at £12 12s.

It seems to us, therefore, that the increase of fees now decided upon in Dublin cannot fail to widen the gulf between the Dublin colleges (which now charge the student about £140 for his education and licences) and other qualifying bodies which profess to give equally good qualifications for £54; and as these anomalies are the groundwork of the radical reform of medical education which everyone awaits, we repeat that the course adopted by the Dublin hospital staff brings us nearer to the end.

Notes on Current Topics.

Experiments in Contagious Diseases.

In the July No. of the *Veterinary Journal* will be found an able article on the experimental method of investigation in reference to the subject of contagious diseases. The writer very properly points out the fallacy of too hastily drawing conclusions from negative results in experimentation, particularly when observation pointed in the opposite direction. When the results are positive, then the case is entirely the other way, and the conclusion drawn is of the highest value. For years the horses of the French army were decimated by glanders; because a few experiments at Alfort yielded negative results, the conclusion was jumped at that chronic glanders was not contagious, and therefore diseased horses were kept in the ranks among the healthy ones. For a long time, confidence in similar experiments led to the belief that horses and other animals could not become affected with this disease through the digestive organs, although now no fact is better established than that some animals are readily and frequently infected through the stomach. The caution to be observed in trusting to the results of negative experiment will be shown in the report of the experiments now being carried on at the Brown Institute, with regard to pleuro-pneumonia and foot-and-mouth disease. It will there be found that all the attempts made to transmit the latter malady by inoculation and other means—save actual cohabitation—failed with a number of animals, and this failure was being quickly seized upon to prove that, if contagious at all, the malady was, at any rate very much less so than had been imagined.

It will now be seen from the further report by Prof. Duguid, which appears in the "Proceedings" of the Royal Agricultural Society, that "four of the experimental animals have become affected with it (foot-and-mouth-disease), by feeding them with hay moistened with the saliva of diseased animals. *And had the virus of foot-and-mouth-disease been more readily obtained, the others would in all probability have been infected before the present time.*"

"Before members of the veterinary profession can receive as conclusive evidence of the non-contagiousness, either by mediate or immediate influence, of those diseases which their every-day experience has taught them to look upon as contagious, the experiments must be repeated again and again on a *large number of animals*, under every possible condition favourable for transmission, and with the most scrupulous care. One experiment yielding positive results, will upset the deductions drawn from countless *negative ones.*"

A few months ago we made some remarks on the fallaciousness of certain kinds of experiment, but then we referred more particularly to experiments that had been made on the action of certain drugs. There are few who will not endorse the observations of our able veterinary contemporary, but we think that while men like Dr. Burdon Sanderson can be found to conduct experiments in physiology and pathology, we shall not be so liable to fall into the same error as we formerly were, and to sacrifice the convictions we had formed from common observation to conclusions drawn from the negative results of experiment.

Therapeutics of Headache.

In a recent number of the *Canada Lancet* Prof. Smith, of New York, has an article on headache, in which the reader is supplied with a remedy for every species of this troublesome affection. For nervous headache, bromide of potassium and valerian; where there is sleeplessness, camphor, cannabis indica, and henbane. In nervous sick headache, guarana 15 gr. every quarter-of-an-hour, for six doses. In gouty headache, colchicum and bromide of lithium. In headache due to syphilis, 1-10th gr. of calomel every hour for a day or two, and afterwards iodide of potassium to the extent sometimes of 350 to 400 grs. per diem. For rheumatic headache, the mild Faradaic current to the scalp, and the internal use of iodide of potassium, chloride of ammonium, and infusion of hops. For the headache of acute alcoholism, or inebriety, a purgative dose of rhubarb and calcined magnesia; then sp. ammon. aromat., with tinctures of camphor, henbane, and lavender, every hour; and lastly, quinine and capsi-

cum before every meal for several days; and if there be sleeplessness, large doses of bromide of sodium, along with chloral hydrate. When dyspepsia is present, an emetic, or a dose of rhubarb and magnesia, or the dilute nitro-hydrochloric acid, if the headache is frontal or orbital; or an alkali before meals if the pain is "located about the roots of the hair;" or nux vomica and bismuth if there be flatulence; or a pill of aloes, nux vomica and belladonna, if there be constipation; or pepsine in a glass of sherry, if the affection comes on directly after a meal. When it proceeds from active cerebral congestion, evaporating lotions, saline cathartics, and a mixture of bromide of sodium, fluid extract of ergot, ginger, &c., or Fleming's tinct. of aconite, if the pulse be full and rapid, and the skin hot and dry. For fuller instruction on these and other kinds of headache, we must refer the reader to the journal above mentioned, for April 1st, 1877. The excerpt is given in the hopes that a hint or two may be taken therefrom. The precision with which Dr. Smith makes the "cap fit" in all these multifarious forms of headache, shows that in this sceptical age he at least has faith in his pharmacopœia; and we trust that the reader will not find in his practice that this confidence has been misplaced.

Illegal Medical Certificates.

Again we have to draw attention to the practice of giving certificates of death by persons quite unqualified to do so. A few days ago a medical student was prosecuted by the Treasury for having forged the name of a properly-qualified practitioner to a certificate of the cause of death.

It appears that Walter M'Irvine, the prisoner, had, up to January of last year, been engaged by Dr. Mason, of Sheffield and Stockbridge, as his assistant, and had in that capacity acquired a considerable reputation at Stockbridge for his medical skill; that when discharged in January last by Dr. Mason, being anxious not to lose the benefit of his connection at Stockbridge, he applied to Dr. Roberts, a duly qualified medical practitioner, to allow him to become his assistant and practise in his name at Stockbridge, an offer which that gentleman declined. The prisoner then began, and continued until after the commission of the offences charged, to practise on his own account, though not legally qualified, at Stockbridge. The offence charged against him arose from his so practising, and was this:—He gave a certificate of the cause of the death of one of his patients, Harriet Haigh, and signed it, not, however, in his own name, as he was not properly qualified to act as a medical practitioner, but in that of Dr. Roberts. It further transpired that the prisoner had systematically given these certificates when his patients died. Mr. Justice Manisty sentenced him to one year's imprisonment with hard labour and remarked that the offence is a most serious one. "You have acted," he said to the prisoner, "as though you were a properly qualified practitioner, in open violation of the law, of which I am unable to believe you can be ignorant. Your crime is that of forging the name of another person in order to conceal the fact of your want of qualification. This is an offence which, perhaps, is hardly likely to be repeated, still it is necessary to pass upon you a sentence which will mark the character of the offence, and operate, as I hope, a warning to others."

The justice of this sentence cannot be questioned. Forgery is under any circumstances one of the most serious crimes that can be committed, and never more so than when, in the cases of death it can be resorted to by any one for the purpose of usurping the functions of a legally qualified practitioner.

If a certificate of death is signed by the person who had been in attendance upon the deceased, but who was not qualified to do so, the circumstance could scarcely escape the notice of a watchful registrar of deaths; but if, through too lenient punishments, forgery were allowed to step in and to defeat the ends of justice, the consequences might be of a very serious nature. Even the homicide might have recourse to this species of forgery as a means of preventing the detection of his crime. The fact of the prisoner having committed the same offence before with impunity, shows that it is a crime which is not easily discovered, and one the serious aspects of which cannot be exaggerated.

On the Antagonism between Morphia and Atropine.

After numerous experiments (*Ann. di Clinica*, No. 77, 1877), Dr. Corona has drawn the following conclusions:—

1. Atropine increases respiration; morphia retards and modifies it.

2. Atropine produces convulsions in dogs and rabbits, but never sleep; morphia induces sleep and profound coma.

3. Atropine retards the heart's action; morphia increases it.

4. At the same time the former only slightly affects the temperature, whilst morphia lowers it.

5. Atropine dilates the pupil, and is one of the most constant and marked symptoms. Morphia may dilate, or contract, or may not exercise any influence.

6. Atropine injected in a large dose into the blood does not dilate the pupil because it paralyses at the same time the circular and radiating fibres of the iris.

7. Atropine always produces vaso-motor paralysis; morphia never.

8. Atropine affects reflex action, and always produces paralysis of the posterior part of the body in animals; morphia leaves reflex action uninjured or sometimes increases it.

9. On microscopical observation the lungs, liver and abdominal viscera were normal after poisoning by morphia and atropine.

10. The heart and large vessels were filled with coagulated blood after poisoning by morphia, whilst the blood was fluid and black after poisoning by atropine.

11. In both cases the meninges were congested, whilst the cerebral substance was anæmic.

11. The poisonous dose varied enormously according to the age and animal experimented on.

The toxic dose of morphia was less in dogs than in rabbits. Atropine was borne in large doses and never produced death below 50 centigrammes, except in very small young animals..

Dr. Corona has made the following reflections :—

Morphia administered in small doses causes the disappearance of the symptoms produced by atropine and induces sleep, but atropine even, in a large dose, does not interrupt the stupor or symptoms of morphia. The injection into the veins of these two poisons, even in small doses, is sufficient to produce sudden and serious poisoning.

Dr. Corona concludes that there exists a physiological antagonism between morphia and atropine, but that on the contrary we cannot admit the theory of a therapeutical antagonism of these bodies, *vis a vis* to one another. Morphia is useful in poisoning by atropine, but the latter is powerless in poisoning by morphia.

Distribution of the Hospital Sunday Fund.

We announced in our last the form which the Metropolitan Hospital Sunday Fund would take in its distribution amongst the various hospitals and dispensaries, also that the councils of certain hospitals would be called upon to explain certain incongruities before any sum was voted to them. This took place on Thursday last, when the members of the Council of this Fund met at the Mansion House, under the presidency of Sir Sydney Waterlow, M.P., to receive the report of the Distribution Committee for the present year.

The report stated that the total amount now recommended to be paid was £24,960, to be divided as follows : £22,747 to seventy-six hospitals (including four institutions which might be classed as hospitals), and £2,223 to forty-three dispensaries. Nearly all these awards were slightly below those of 1876, in consequence of an increasing number of applications to participate, and a decrease in the amount to be administered by the Council. It was proposed that any additional payment to the Fund after the present date be allowed to accumulate in aid of next year's Fund.

The Chairman, in opening the proceedings, stated that since the meeting of the Committee attention had been called to circumstances of a grave character affecting the management of, and the treatment of patients by, the Hospital for Diseases of the Throat, Golden Square, W., of which the Prince of Wales is patron, and at whose instigation an inquiry had been held. The Distribution Committee had received a report upon this inquiry ; but it was marked confidential, and he consequently could not read it to the Council. The Committee, however, recommended on such report that the award should be withheld for the present ; and he, therefore, took leave to move a resolution to the effect that, inasmuch as an inquiry had recently been held into the management of the Hospital for Diseases of the Throat, the proposed award to that hospital be temporarily withheld.

Bishop Claughton moved the adoption of the report, with the exception of the item referred to in the Chairman's resolution, which was carried.

The Secretary here made a statement, to the effect that in 1875 the collection made in 1,120 places of worship amounted to £24,901 18s. 10d. ; in 1876, in 1,089 places of worship, amounting to £25,655 ; whilst this year, 1,115 places of worship contributed.

Unanimous votes of thanks were then passed to the Distribution Committee for their labours, and to the Lord Mayor, and the proceedings closed with the usual vote of thanks to the Chairman.

Uranostaphylorrhaphia.

M. Lannelongue considers, with a view to operation, that we must introduce two divisions, according as the solution of continuity is total or partial. In the case of complete division the velum palati is itself divided. The partial presents two varieties; in the first are all the divisions, lateral or medium, which generally stop at the anterior palatine hole. In the second variety, that of posterior fissures, the velum is always divided, and the cleft of the palatine vault is always extended.

The complete posterior divisions are called median or bi-lateral when the vomer falls in the middle of the cleft; they are unilateral when the vomer encroaches on one of the borders.

As regards the question of age in children, four operations have been performed immediately after birth by Billroth, Simon, Rouge, and Otto Becker, but they all died from the ninth to the twenty-fifth day, one of dysentery, the other three of pulmonary consumption. Simon operated on a fifth child on the fourteenth day, but it also died.

The results are much more satisfactory if the operation is performed some months after birth, or any time during the first year. Out of five operations M. Lannelongue was twice unsuccessful, but had no death. Doubtless this difference in results has induced surgeons to defer the operation till the sixth month. M. Lannelongue does not think that this operation is one of urgency. He believes that the child should be in a healthy condition, but towards the age of three or four, when the functional exercise of speech is beginning, the operation is demanded, as a better result is obtained if the child has never spoken. The method which he employs is the one first suggested by Dieffenbach, but now called after Fergusson, who appropriated it and used it twenty-four times towards the end of his life. There does not appear to be osseous reunion, although the vault of the palate is capable of assisting mastication.

M. Lannelongue has performed this operation eight times ; six of his patients being girls, two boys, whose ages varied from four and a-half to eighteen years. Five were successful, two unsuccessful, and one incomplete.

Blood-letting in Pneumonia.

There can be no doubt that the profession has of late years committed a great mistake in so summarily abandoning the practice of wet cupping. Formerly there was scarcely a practitioner who had not a set of cupping instruments ; now there is scarcely a practitioner who has them.

A case was recently admitted into the University Hospital, Baltimore, in which this practice was adopted with success. The patient was a stout, robust young man, suffering from pneumonia of the left lung, with slight effusion into the pleural cavity. The temperature of the patient was 103°, pulse 120, and respiration 35. There were severe pains in the side, which caused great distress in respiration and coughing. As these symptoms became

worse, with high temperature and further embarrassment of the respiration, two wet cups were applied over the seat of pain, and two ounces of blood abstracted. Relief followed almost immediately; the patient enjoyed a refreshing rest. Convalescence was established on the following day, and on the sixth day after admission the patient was walking about the wards. The medical treatment consisted of a diuretic, and ten grains of Dover's powder at bed-time. The reporter remarks that there was every indication of the inflammation advancing, and that its progress was arrested by the local abstraction of blood by means of cupping. No sooner were the cups applied than the pain was relieved, and the general condition of the patient improved.

Treatment of Croup.

A "Backwoods Country Doctor," writing to one of the American journals, gives the following plan of treatment. In the early stages he administers purgative doses of calomel, after the action of which quinine, flowers of sulphur, and chlorate of potash, aa grs. xij., are mixed and divided into twelve powders, one of which is given (to a child three to five years old) every two hours, in some mucilaginous vehicle. If the dyspnœa is urgent, cloths wrung out of the coldest water procurable are applied constantly to the chest. If the false membrane is extensive, the throat is mopped once in six or ten hours with a solution of nitrate of silver (grs. x. ad ℥j.), and vomiting is induced with zinci sulph. when the swelling in the throat is very great. The child is also allowed plenty of fresh air, instead of being housed and muffled up, as these patients generally are. After the false membrane disappears the cautery and emetic are omitted, but the powders are continued at longer intervals.

The administration of the quinine and potash powders, in conjunction with a plentiful supply of fresh air, is by no means bad practice, but would, we imagine, be more useful in the epidemic forms of diphtheria than in sporadic cases of inflammatory croup. The exposure of the child to plenty of fresh air is, in our opinion, the part of the treatment most worthy of attention.

Hospital Fees in Dublin.

An adjourned meeting of the physicians and surgeons of the Dublin clinical hospitals, to receive the report of the honorary secretaries and adopt, finally, a scale of fees for hospital practice, was held on Monday, the 30th ult., at the College of Physicians. Representatives from the various hospitals were present, the chair being occupied by the President of the College of Physicians. The following resolutions were unanimously agreed to :—

1. That the fees for hospital practice be raised, from the 1st of October, 1877, as follows :—

For nine months,	£12 12s.
For six winter months,	8 8s.
For three summer months,	5 5s.

2. That the practice of taking perpetual pupils at the Dublin hospitals be abolished.

3. That the report as adopted, signed by each hospital physician and surgeon, be printed, and that copies be furnished to each hospital, and that the original document, so signed, be lodged with the registrar of the College of Physicians.

It will thus be observed that the scheme of fees as given above has been unanimously adopted, the several boards thus acquiescing in an arrangement which places all the hospitals upon an equable monetary footing.

The Parent of Obstruction.

At the meeting of the Edenderrry (Kildare) Guardians last week, Dr. Grattan, who boasts to be the Senior Member and Fellow of the King and Queen's College of Physicians, and resides on his property within the Edenderry Union, brought forward a notice of motion calling a special meeting of the board to take into consideration the best means of providing against famine, and of relieving destitution.

Chairman—I think this notice of motion is quite uncalled for.

Dr. Grattan—I think otherwise. What would we do if the Colorado beetle should come, or if cholera should come ?

Mr. Langan—We should try and obstruct its progress.

Dr. Grattan—Who was the originator of the policy of obstruction in the House of Commons ?

Chairman—You were.

Dr. Grattan—Yes. Dr. Richard Grattan, of Drummin House, county Kildare, advocated the policy of obstruction forty years ago.

Chairman—And you practised it here ever since.

It was moved that Dr. Grattan's resolution be not received.

The resolution was put, and all the guardians voted for it except Dr. Grattan, whose notice of motion was therefore not received.

The Sale of Food and Drugs Amendment Bill,

Which was introduced, as noted in our last issue, by Mr. Isaac, M.P., turns out to be a measure to enable public-house keepers and druggists to sell watered spirits if they sell it cheap, and to call it by the name of the unsophisticated article. The Bill consists of one clause, and enacts that "in determining whether an offence has been committed under sec. 6 of the Act, by selling to the prejudice of the purchaser, whether wholesale or retail, spirits reduced by the administration of water, regard shall be had not only to the extent of such admixture, but also to the price at which spirits so reduced are sold."

This proposal, it will be seen, would if adopted, carry with it the principle that a trader may sell any weakened or adulterated preparation under the name of the genuine article, if he sell it cheap enough. We imagine that the Bill is created to meet the case of the druggists who have been recently convicted of selling "sweet spirits of nitre" largely diluted with water. The *fiasco* in Parliamentary business which has arisen out of the obstructionist episode, has enabled Mr. Isaac to get his Bill through a second reading, but it has met with opponents in the person of Dr. Cameron, M.P., of Glasgow, aud the doughty Mr. Biggar, who have tabled a motion that it be read a third time in three months.

A very unusual death succeeding chloroform inhalation,

took place at Dawlish last week. The patient was a young woman of 23, whom it was necessary to cut for squint. She took about four drachms, and appeared to have perfectly recovered from the effects, which presented no unusual symptom, when she was found dead in her bed some hours afterwards. A *post-mortem* revealed the existence of cerebral apoplexy, and the jury returned a verdict that the death resulted therefrom.

The Muscular Equivalent of the Human Animal.

THE working value of the human muscular system has of late years received great development and wonderful illustration. Not long since, a man who could do his 50 miles in the day was a phenomenon. The first time that a pedestrian accomplished 1,000 miles in 1,000 hours, the feat was considered astonishing, but it was at once eclipsed by the walkers of 1,000 half-miles in 1,000 half-hours, and at length we have reached the acme of a performer who, though quite a novice—completely distances the "useful effect" of all former pedestrians in his line.

Last week, William Gale, a pedestrian well known at Cardiff, completed the extraordinary feat of walking 4,000 *quarter miles in consecutive ten minutes*, commencing each quarter mile at the commencement of every ten minutes. Although evidently fatigued he walked the last quarter of a mile but one in three minutes and the last in five minutes.

It involves a considerable stretch of imagination to realise the endurance of a man who can walk for nearly a lunar month night and day, never resting more than a few minutes at a time during the whole period, and travelling on foot a distance exceeding the limits of Europe.

Last week a pedestrian named Smyth, and appearing under the name of "the American Postman," achieved the task of walking 300 miles in six days at Dublin. His regimen during the walk was as follows:—He takes a small chop and some cocoa for breakfast. In two hours afterwards a raw egg beaten up. His dinner consists of a sago pudding and a small quantity of very raw beef, without drink, and his supper of as much cocoa and bread and butter as he wishes. Each day he is allowed a quart of milk and occasional sips of ginger ale. He takes no alcoholic beverage whatever.

Lecture Advertisements amongst our Ancestors.

THE *Union Médicale* gives us the text of a placard posted in the neighbourhood of the Paris University on 19th of May 1616. We give a translation.

"M. Charles Guillemeau is preparing to deliver his lectures in the abovenamed lecture theatre, they having been commenced long since in his own house.

"If God gives me life and health, I propose to read to the students a book which is in my library and which is very valuable for surgeons. It is entitled *Octavii Horatiani verum medicarum libri quatuor*. The book contains four volumes, and I have also Albucasis' 'Surgery.'

"God grant me strength and energy to do this."

New Members of the Profession.

DURING the first six months of the present year four hundred and twenty-three names were added to the official *Medical Register*. We have taken the trouble to analyse the returns just to hand, and find that of this number one hundred and ninety-nine passed the English qualifying boards, one hundred and nineteen the Scotch, and sixty-eight the Irish boards. Beside these, thirty took up the English and Scotch qualifications jointly; six the Irish and Scotch; and one the English and Irish. These figures are open to one or two suggestions: either the fees for Irish qualifications are higher, or the examinations are more difficult, as there were many Irishmen crossed the Channel for Scotch diplomas, while scarcely one went to England; again, of all those who obtained the Irish diploma, one only cared to add the English thereto. These would lead to the appearance that Irish degrees when once obtained place the holders in the proud position that any additions would be superfluous.

Invalids' Home Association (Home Hospitals).

THE Duke of Northumberland has promised to contribute £1,000 to the above association if the whole of the £20,000 named in the prospectus is raised by Jan. 1, 1879. About £4,000 has been promised already, and further contributions may be sent to the hon. secretary, at the Mansion House, or to the bankers', Messrs. Barnetts, Hoares, Hanburys, and Lloyds, Lombard Street, E.C.

Death of an Illustrious Chemist.

J. B. CAVENTOU, who died recently in Paris at the age of 82, was one of the most illustrious chemists of the present century. To him the world is indebted for some of the most important alkaloids in use. He was the first to isolate quinia, veratria, and strychnia, as well as a large number of others. It was he also who first demonstrated the existence of chlorophyll in plants. He entered the Academy of Medicine at the age of 27. For thirty-two years he held the Chair of Toxicology at the School of Pharmacy in Paris, which he resigned in 1858, despite the urgent entreaties of all his colleagues and pupils to remain.

Archæological Congress.

As previously announced, the annual Congress of the British Archæological Association, opens at Llangollen, on Monday, 27th inst. Excursions will be made by the members to places of interest in the district each day, and evening meetings will be held throughout the week. The Congress will close on Monday, 3rd prox.

IT is stated in the *Pharmaceutical Journal and Transactions* that a number of spurious drugs have appeared upon the London market: capalchi bark was offered as angostura bark; Para bark, devoid of alkaloids, but closely resembling quilled calisaya, was offered as such; besides a spurious cinchona. Black or striated ipecacuanha was tendered at a lower price than the true root. Indian dill seed (*Anethum Sowa*) have been offered as Sowu seed, instead of common dill seed.

We have always been of opinion that asylums, whether for the treatment of the insane or for inebriates, should be under the direction of medical men. Many fairly well-managed institutions are, it is true, licensed to the laity, but for obvious reasons, this is certainly an unwise course on principle. We are glad, therefore, to hear that Dr. L. S. Forbes Winslow has just opened an asylum for the care and treatment of dipsomaniacs at the Limes, Mortlake, within a few yards of the Thames. Some of our readers will doubtless be glad to learn where they can send patients under skilled medical supervision.

In order to familiarise the public with that dreaded pest, the Colorado beetle (*Doryphora decemlineata*), about which there has been so much talk of late, Messrs. Hardwicke and Bogue have published a coloured plate of the creature in its natural size, and also highly magnified and coloured. As the sheet is only sixpence, we doubt not many will be glad to become acquainted with it on paper, so as to be able to put their foot on it when they see it *in propria persona*.

The Swedish University of Upsala is preparing to celebrate the 400th anniversary of its foundation. This University, one of the richest in Europe, was opened on the 21st of September 1477. It accommodates 1,500 students and has four faculties, one each of medicine, theology, law and philosophy, which latter includes literature and science.

A statue of Linnæus is to be erected in the "Hop Garden" at Stockholm. The great naturalist is to appear surrounded by allegorical figures of Botany, Zoology, Mineralogy, and Medicine—the four sciences to which he devoted his attention.

Dr. Richardson's Abode of Health (Hygeiopolis) is likely to prove a reality. The architect and engineer are said to have nearly finished their designs, and the first stone of the buildings will probably be laid before the winter, at Courtland, Worthing.

For the first time for more than a year the mortality rate of Dublin for the last week was (17·7 per 1,000) below that of London and Glasgow, though still above that of Edinburgh.

A new highly-praised remedy for skin diseases, said by Dr. Murray to produce wonderful effects in some cases of tinea and eczema, is a new Chinese drug, *Tong pang chong*, said to be the product of *Akebia quinata*.

The Queen has forwarded a donation of £50 in aid of the repairs and improvement, now in progress at the Westminster hospital, to which her Majesty has been a large annual subscriber since 1838.

The Goldsmiths' Company has made a grant of £100 in aid of the funds of University College Hospital.

Correspondence.

THE TEMPERANCE HOSPITAL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Having perused the correspondence and articles which have appeared in your columns with reference to the Temperance Hospital, I write to state the following facts:—

While lately in practice at Notting Hill I sent into the Temperance Hospital several cases of a very severe character, and such as were unmanageable in general practice. They all received the greatest attention from the medical officers, and they all did remarkably well under treatment, which was entirely non-alcoholic. There is no doubt that the managers have had the wit to secure the services of a most able staff of medical officers. They have, moreover, had the good sense to act upon advice given, I believe, by Dr. Edmunds, and, instead of asking men whose time is of great value to work for nothing, they have affixed an honorarium of one hundred guineas a year to each of the visiting medical officerships. In this way a sense of real responsibility is no doubt attached to work which, in many of our hospitals, is done in a perfunctory manner, and merely made a convenience of. I venture to suggest that if only this one point were imitated by the managing bodies of all other hospitals we should have fewer of the abuses which now mar the results of their practice, and that the true value of gratuitous medical advice would soon be more correctly estimated.

It would be to the advantage of the profession, and the public as well, if there were fewer of a certain class of ambitious young University physicians and surgeons (in the out-patients' departments especially), who, to advertise themselves and get a little experience, cut up general practice and manufacture paupers, by giving for nothing at all advice and medicine to patients who, in a great many cases, can well afford to pay at least something for it.

Reverting, however, to the results of the medical work done at the Temperance Hospital, and allowing for all the advantages which the managers have thus secured for the treatment of their patients, there still remains the fact that some 5,000 patients, including all such cases as are usually received in our great London hospitals, have been treated most successfully altogether without alcohol. In fact, except upon one occasion, I understand that alcohol has not been given either pharmaceutical, medically, or dietetically; nor has there been any question of using "substitutes," at any rate, not in the practice of Dr. Edmunds, with whom I happen to have come most into contact. A work of this kind, supported as it is by a body of most active and energetic philanthropists, cannot be without its influence upon the public mind, and I do not wonder at the subject becoming a theme for active discussion among your medical readers.

I should like to refer to one notably severe and anxious case which was among the patients sent by me into the Hospital—that of Madame R., in which the Cæsarian operation was performed by Dr. Edmunds, and in which the patient recovered without a bad symptom. Now, I can hardly imagine a case in which, upon general principles, alcohol would be required if not in this one; still, I should give alcohol in cases of syncope from hæmorrhage, uterine or otherwise, under my own care, because that is the usual practice, and I have not seen enough cases treated otherwise to justify me in recasting my practice in cases of such instant jeopardy to life. What I have seen at the Temperance Hospital, however, more especially in connection with the operation already referred to, has made a deep impression upon my own practice in regard to the use of alcohol. Perhaps, also, I may add that, since witnessing this case, and the active work done by Dr. Edmunds for many years as a total abstainer, I have myself recently become an abstainer, and have come to the conclusion that alcohol, when used as a common beverage, acts injuriously on the body, impairs the memory, deadens the understanding, and perverts the will. When I left off alcohol I first limited myself to a pint of malt liquor each day for my own sake, but some months afterwards, on the recommendation of Cardinal Manning, I undertook to abstain totally for the sake of example; and now, my health having been greatly improved by total abstinence, I shall never again take alcohol nor recommend it as a beverage.

Yours very truly,

M. Annesley Lamb, M.R.C.S.E.

457 Commercial Road, E.,
July 31, 1877.

THE FRUITS OF PHILOSOPHY.—THE SURPLUS POPULATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I quite agree with your views, and thank you for your defence of morality, and if you will allow me space I will give a very beautiful quotation from Charles Dickens which may strengthen your position. It is from his "Christmas Carol," on the subject of our surplus population, and is addressed to the Malthusian Scrooge :—

"Man," said the Ghost, "if man you be in heart, not adamant, forbear that wicked cant until you have discovered what the surplus is and where it is. Will you decide what men shall live, what men shall die? It may be that in the sight of Heaven you are more worthless and less fit to live than millions like this poor man's child. *O, God, to hear the insect on the leaf pronouncing on the too much life among his hungry brothers in the dust.*"

May I say with the enigmatical Jack Bunsby, "The bearings of this observation lays in the application on it."

"That an't no part of my duty."

"Awast, there; keep a bright lookout for'ard, and good luck to you."

Echoing the last words, I must sign myself—

One-who-might-never-have-been-born-if-the-"Fruits-of-Philosophy"-had-been-practised, or, in other words,

Yours faithfully,

THE FIFTH OF A LARGE FAMILY.

Aug. 3, 1877.

"THE FRUITS OF PHILOSOPHY."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your correspondent, Dr. Drysdale, concludes his last letter to you with these remarkable words, "Until I have heard something *really* telling against the advice of Knowlton . . . . I shall look, as I have always done, on *conjugal prudence* as the truest basis of every social virtue."

To me, sir, it seems incomprehensible that a man of Dr. Drysdale's social and professional standing should, after your own and Dr. O'Flanagan's able *exposés* of the "Fruits of Philosophy," persist in writing in favour of the miserable practices inculcated in that now notorious brochure, and I can only conclude that the worthy doctor is happily ignorant of the true nature of the "fruits" he recommends for the consumption of others.

If you will permit me, I will endeavour to show him what some, at least, of these points really are—In the first place, the practice of systematically preventing conception, while still indulging *ad libitum* in sexual congress, cannot, I think, but conduce in a most lamentable manner to the moral degradation of the persons so acting, and when mutual respect between married people has been thus lost, what are their relations better than those of a prostitute and her customers?

The doctor tells us that the highest social virtue is to limit our families—not by continence, be it understood, but by *conjugal prudence;* and points to France as a happy country, where that fruit of philosophy is comprehended and practised. But the French peasant, bourgeoise, propriètaire, noble even, knows nothing, and cares less about "the Rev. Dr. Malthus and his immortal theory that there is a constant tendency in population to increase faster than the means of subsistence" (is there? I really doubt the fact). He simply knows that his property will be divided at his death in equal proportions among all his children, and that, consequently, the fewer of them he leaves behind him the richer each of them will be. His motive, then, in limiting, by recourse to dirty and unnatural practices, the number of his children, is far from being so loftily philanthropical as the doctor would lead us to infer, but is simply and meanly *selfish*.

Can anything be more fallacious than the doctor's reasoning (?) on this point? Germany has a larger birth-rate than France, consequently Germany is poorer (!) What of England, whose birth-rate is greater than either? Will the doctor venture to assert that we are poorer as a nation than our Teutonic relations? But if he does it will not alter facts. Poor France! I believe the time is not far distant when the average Frenchman will have no need of *conjugal prudence* to limit the number of his family; his gaûts de collège will confer ample immunity.

What, again, are the social qualities of small families? The population decreases in an alarming manner, so much so that from being the leading power on the Continent, France is fast declining to a third or fourth-rate place, and that in spite of the individual wealth of her remaining inhabitants.

The race, too, is positively deteriorating. Where are the stalwart grenadiers who came so near making mince meat of Wellington and his Guards at Waterloo? The average French soldier is a dwarf, let Dr. Drysdale deny it if he can. I have lived nearly twenty years in France, and do not speak from hearsay, but from intimate personal knowledge.

Another consequence of small families is to destroy all family feeling, all sense of *home*, a word unknown to Frenchmen, and to them quite incomprehensible. Jealousy and hatred take the place in the majority of French families of the love and affection which we are used to associate with the home circle; and naturally so, each French child is a rival to the one born before him. I shall not soon forget one of my schoolfellows when M. le Principal came with a grave face to tell him of the sudden death from fever of an only sister. The boy—he was about fourteen—jumped up, clapped his hands, and exclaimed, "Oh! I shall now be twice as rich as I expected to be!" So much for the social virtues engendered by the limiting of one's family, for this incident, sir, unnatural as it is, is by no means a solitary instance of similar sentiments existing among the French; like the straw in the river, it shows which way the current flows. If there happened to be two brothers at school they invariably hated each other and seldom spoke.

Such, sir, are a few of the fruits of the pseudo-philosophy advocated by Dr. Drysdale and his Malthusian friends.

Conjugal prudence is necessary, your correspondent asserts, to enable men to marry and prevent them falling into prostitution and masturbation. I presume the doctor means falling in with prostitutes. Well, it is an open question whether a natural connection with a prostitute be not preferable to an unnatural connection with "a wife in name only." Even masturbation, in my opinion, is preferable to *conjugal prudence*, for it only ruins the health and destroys the morals of *one* person, while conjugal prudence has the destruction of *two* to answer for.

The doctor appeals to Scripture and "pious persons." I will not remind him of another individual who also quoted Holy Writ when it suited his purpose to do so; but I should be glad to know what weight he considers is due to the thousands of clerical authorities whose conclusions are the opposite of those of the "Reverend" Mr. Malthus and Dr. Drysdale, in respect of "voluntarily limiting one's family"?

One would imagine, to hear these gentlemen declaim, that the world is over-populated! Some small corners of it may be, but surely there is room enough and to spare on its surface for all the people that will be born for thousands of years to come, to the utter neglect of Dr. Drysdale's *conjugal prudence*.

These filthy practices having, then, no *raison d'être*, I trust we shall hear no more about them; but let those who admire them adopt them in silence, and not disgust the vast majority of Englishmen by parading them in public.

For my part, sir, until I have heard something *really* telling IN FAVOUR of the advice of Knowlton (and Dr. Drysdale) to proportion the family to the means of the parent (what means? present or future? and would a very rich man be justified in begetting as many children as he could?) and to the state of civilisation and capital (whose capital? individual or national?), I shall look, as I have always done, on *conjugal prudence* as the truest basis of moral and physical corruption, individual as well as national, and of every social vice.

I am, sir, yours respectfully,

W. T. GREENE, M.A., M.D. T.C.D.

218 Old Kent Road, S.E.

MIDWIFERY FORCEPS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—A letter from me on the above subject appeared some time ago in yonr journal. In it I suggested some changes in Knight's forceps, and by those alterations I believed they would possess all the *advantages* of Tarnier's forceps. I believe so still. Dr. Hart accuses me of claiming credit for this: I am not aware of making any such claim. He says

any ordinary forceps is capable of the curves I proposed—I say they are not, for the handles must be nearly as long as the blades. I hope it will please Dr. Hart to learn that my "suggestions have been carried into effect, and that the instrument is made by S. Maw, Son, and Thompson, and if he attends the meeting of the British Medical Association in Manchester I will let him see them, and give him any further information he may require. Does it offend Dr. Hart that I try to rival a Frenchman? If so it is a pity. Drs. Tarnier and Hart may think it a great advantage *to see* in what direction to employ traction. I prefer the old-fashioned plan of *feeling my way*, because it is the safer plan. If Tarnier's forceps are screwed on so tight that you are sure they will not slip, you will be almost equally certain that you will kill the child. Dr. Atthill, a man of experience, bears me out in this. But I believe Dr. Hart does not understand my instrument at all, and his idea of the anatomy of the pelvis is ridiculous—he talks of the *posterior* edge of the fourchette! (it has no posterior edge unless the part is dissected out). I hope no one will attempt to rob him of the *credit* of *this* discovery. I have fourteen years' experience in the use of forceps, and have operated about 140 times, and I have invariably found if I could move the child's head at all (by way of extraction) when it was in the inlet of the pelvis, I had no difficulty afterwards, and the principal reason of my having any difficulty then was because I could not use traction in the axis of the pelvis; I always kept one hand in contact with the child's head and the instrument; this gave me all the information I required. My instrument, I maintain, enables the operator to employ traction in the axis of the pelvis, from inlet to outlet, *without using dangerous or continued pressure*—this *no other instrument* can do. The extremities of the handles of my forceps are *not* joined by a cross-bar, but, as I said before, they end in blunt hooks; these are grasped by a link, to which is attached a swivel on crossbar or handle, by it to employ traction—at the same time it permits the child's head to rotate. The link is broad in the middle, sharp at one end, and blunt at the other. When the instrument is applied and locked and the handles pressed together with whatever force may be considered necessary, it will then be seen which end of the link is the proper size for keeping them at that pressure after traction has been applied to the handle. The link acts as a double inclined plane on the extremities of the handles, and presses them together in proportion to the amount of tension employed, until they rest on the end of the link; this is the limit, and of course the maximum, of compression that can be made. The moment traction is discontinued the blades relax of their own accord, there is no danger from continued pressure. I will now contrast my instrument with Tarnier's:—1st. Mine is easy to apply because it is the shape of the axis of the pelvis; Tarnier's is difficult. 2nd. Mine can be used as a tractor in the axis of the pelvis, and permits rotation, and does not injure by continued pressure; Tarnier's is a good tractor and permits rotation, but injures by continued pressure. 3rd. Mine will not slip; the greater the tension the firmer they grasp; Tarnier's may slip. 4th. Mine can be removed quickly; Tarnier's can not. Perhaps Dr. Hart will now tell us which of the instruments has the most advantages.

Yours truly,

DAVID CHRISTIE, L.R.C.P.ED., &c.

Carrigart, co Donegal, 28th July, 1877.

Obituary.

DR. WILLIAMS, OF COLCHESTER.

DURING the past few weeks it has been our painful duty to record the death of several well-known and popular provincial medical men, and now we have to add thereto that of Dr. Edward Williams, whose name will probably be familiar to our readers in connection with his papers on the "Etiology of Consumption," which appeared in our columns. To others he will be remembered for his rather clever monograph "On the Tongue," which reached a second edition. Dr. Williams was born in January, 1808, consequently he was between sixty-nine and seventy when he died. He graduated at the University of Cambridge in 1832, from which Institution he obtained both the M.B. and M.D. degrees. At Colchester, where he resided, he was a very popular man, albeit a few idiosyncrasies, which we will not mention here. He was four times elected mayor of that city, and was for many years magistrate and alderman of the borough, besides holding the appointment of consulting physician to the Essex and Colchester Hospital, and to the Essex Hall Idiot Asylum.

Literature.

MEDICAL MEN AND MANNERS.(a)

THE most rare—the least popular the most unfruitful to its friends, yet the most valuable to its enemies—the most universally professed but most seldom practised of all human arts, is TRUTH. A taste for it is ruinous to the unhappy victim of that appetite, who, while deserving of admiration and respect, is treated as a nuisance and to be avoided, "Honesty is the best policy," *Magna est veritas et prevalebit*, and such like aphorisms, serve an excellent purpose, truly, as copy-book headings, but should be carefully forgotten as soon as they have served their turn as an injunction to those who have not yet learned their fatuity in practice. The truth-teller is, paradoxically, at the same time a criminal and a public benefactor, and while every man's hand is against him, there can be no doubt that his offence yields great benefits to those who hate and avoid him. In no walk of life is this more true than amongst doctors. We all know what we know, but woe to the man who is rash enough to speak it out!—yet from whom comes any hope of medical reform? Not, certainly, from the quiet, harmless, silent, and respectable gentlemen who have learned the wisdom of holding their tongues, but from the bores and hare-brained fellows who drag the peccadilloes of our professional system into the full public gaze. One of these is the demented author of "Contradiction: or, English Medical Men and Manners"—a brochure already well known and widely read, and we say the more widely the better, because we look for the only cure for the ills of the profession in a full exposition of the system before the eyes of those who may be able to enforce a remedy. Beginning with universities, schools, and colleges, the author conjugates the profession through all its moods and tenses. His historical introduction is interesting and much of it new, and of itself is worth perusal, but it is carried on through the past legislation of the profession until the author is led up to our present *status quo*, to which most of his attention is devoted. He opens his disquisition on this subject with the following paragraph:—

"Most reforms by legislation in this country produce, at any rate while under preparation or discussion, more or less public excitement. The *Medical Act* produced none at all. It passed through both Houses of Parliament and received the Royal assent in almost utter stillness. But if indifference awaited it from without, within the profession it had its share of attention. Before the Act was prepared and before anything was done in Parliament, it was felt that in the profession, things were so bad that worse they could not be, and therefore any law, or any interference, must have a good effect. To produce this the doors of the profession should be better guarded than they were, and this at the very outset any law was certain to effect. . . .

"Doctors so ignorant have ornamented the profession within these thirty years, that they could not 'work' all the simple rules of arithmetic, although they made a 'shift' now and again at 'multiplication' and 'division.' Nor could they spell correctly some words of only one syllable in the English language, not to mention any other language, 'living' or 'dead.' As to how they ever obtained

a) "Medical Men and Manners of the Nineteenth Century." 'Ατιθάσσευτος. 1877. London: Baillière, Tindall, and Cox.

a diploma is a mystery known only to themselves and their examiners (always putting aside the question of personation at examinations). But in the 'good old days,' before the Medical Act, diplomas were not hard to get. Among general practitioners, those qualified within at most these fifteen years know the full value of such a thing."

Describing the various sorts of doctors, which he does with much pith, "Men and Manners" speaks thus of a species of medical man with whom we are all occasionally acquainted :—

"Brought to a consultation at the request of the ordinary attendant (general practitioner or otherwise), if this man gives the great man *all* his consultations, he confirms all that he (the ordinary attendant) has said or done rightly or wrongly, and he condemns all that he has condemned. But if brought in by the wish of the family, and against the wish of the attendant, he almost as certainly condemns all that he has done, and suggests or institutes a treatment—*in appearance*, at least—entirely different. This he does, not always openly, but by hints, shrugs, and other expressions of displeasure, either of countenance or by pantomime in general. And if the case ends favourably at last, he takes every pains to make it be understood that he, and he alone, was the instrument of this. But if unfavourably, he takes quite as much pains to disclaim all responsibility. Thus in whatever way any case of his ends, he is ever prepared to justify and even to exalt himself."

We give these paragraphs, not as our own creed, but as specimens of the author's style, which we cannot afford space to continue further. The brochure contains very much plain and painful truth, which in many instances might be made less repulsive without abating its force, and when the second edition comes to be isssued (as we doubt not it will) we should counsel a weeding out of unnecessarily offensive phrases. The frequent repetition of italics, capitals, and quotation points are also a grave literary blot upon the book, and the author will achieve more respect for his utterances if he confines himself to plain type and unalloyed fact.

TABLES OF MATERIA MEDICA. (*a*)

The great reputation attained by the compiler of these "Tables" as a teacher and as a scientific worker in the subject of Materia Medica led the writer of the present notice to look forward with great interest to their publication. The expectations entertained have not been realised. The "Introduction," indeed, is worthy of Dr. Brunton's pen, but the body of the work is the baldest production in the existing literature of Materia Medica. This subject, taught as it is at present, is almost universally disliked by students ; it is considered to be a mere uninteresting collection of unconnected botanical, chemical, pharmaceutical, and therapeutical details. This is not the place to advocate reform in the manner of teaching and the matter taught, but surely it is the duty of a reviewer to pronounce an adverse opinion on a work which presents the subject matter of a science, if what is meant by "materia medica" can be so denominated, in its most repulsive aspect. A student could never learn materia medica from this volume—very few students will ever try. Actual inaccuracies are not numerous, but the matter is meagre in the extreme and the arrangement is faulty. One great characteristic of the "Tables" is the enormous space occupied by blanks and the absurd reiteration of the word "ditto." We do not wish to deny the value of a judicious tabular arrangement, but "Tables" which are for the most part made up of blank spaces and "dittos" are not to be commended. It is a matter of sincere regret to the writer to have to speak thus disparagingly of Dr. Brunton's book, for the labour which has been bestowed on the compilation must have been excessive, and must command respect, while at the same time regret must be felt that valuable time was not more worthily expended.

(*a*) "Tables of Materia Medica : a Companion to the Materia Medica Museum." By T. Lauder Brunton, M. D., Lc. O., F.R.C.P., F.R.S., Assistant Physician and Lecturer on Materia Medica at St. Bartholomew's Hospital, &c.

A REPORT TO THE SURGEON-GENERAL ON THE TRANSPORT OF SICK AND WOUNDED BY PACK ANIMALS. (*a*)

The subject of the transport of sick and wounded by pack animals has latterly attracted much attention in the United States Army, owing to the contests with Indian savages, during which expeditions have frequently penetrated into unexplored regions, and engagements have taken place in situations altogether inaccessible to wheeled vehicles. The conditions of such warfare entail the necessity of modifying the arrangements for providing surgical assistance for the wounded or disabled. The ambulance equipment must be able to keep up with the troops, and not to interfere with their rapid movements ; must provide the essentials of surgical aid far from a base of supply, and often improvise, for the comfort of the wounded, appliances that cannot possibly be transported. Under such circumstances, officers have recalled the expedients of the hardy explorers of the frontiers, and have endeavoured to improve them or to adopt them to unexpected exigencies. A number of interesting reports on the various devices employed have been transmitted to the Surgeon-General's office. These have been collected and arranged by Assistant-Surgeon Otis in the monograph before us.

Dr. Satterles's report from Florida contains the earliest mention of any scheme of ambulance administration and equipment in the field service of the United States army. This was during the hostilities against the Seminole Indians (1835-1838). In consequence of the roughness of the road, litters between two horses had to be used. Described as a very comfortable means of transportation, but difficult in consequence of the number of men and horses required. For the efficient use of cacolets, it would appear, as the result of experience, that horses and pack mules of sufficient strength and docility were essential.

In the campaign in Mexico, in 1864, M. Gouchet, Médecin-Major, 1st Zouaves, carried his sick on a field-stretcher, secured to a pack saddle. "This adaptation of ordinary hand-stretchers to the purposes of a single-litter mule conveyances," writes Dr. Otis, "is admirable in principle ; and if means can be devised to secure such stretchers on pack animals, without pitching them so high as to endanger the patient and encumber the animal, such arrangement would be the simplest and best."

In a memorandum forwarded from Fort Saunders, Wyoming, January 15th, 1877, Surgeon Clements writes: "Litters drawn by horses or mules are not to be regarded as a last resort for the transportation of wounded men. On the contrary, they are superior to any mode of land transportation for certain classes of wounds. These wounds are, especially, gunshot fractures of the bones of the lower extremity, and particularly of the femur. Mules are preferable to horses, being smaller, more sure-footed, and having a shorter step."

At another page, Assistant-Surgeon J. H. Petzki writes: "Ready transportation, available at any moment, is a great *desideratum* in Indian warfare ; it would expedite the movement of the troops, lessen suffering, and reduce the danger of the wounded and dead falling into the hands of savages."

There are many illustrations of the *travée*, or Indian horse-litter. A sacking bottom is lashed to two poles, that are separated by traverses, and secured to the stirrup-leathers of a cavalry horse, equipped with the regulation

(*a*) "A Report to the Surgeon-General on the Transport of Sick and Wounded by Pack Animals." War Department, Washington, March 1st, 1877. By George A. Otis, Assistant-Surgeon, U.S. Army

saddle. The soldier's pack makes a pillow, and a blanket is thrown over him. Owing to its being easily constructed, requiring but one animal and one man to manage, it is considered by some surgeons superior to the two-horse litter.

Dr. Otis very properly remarks on these various improved forms of litter, that "it is not prudent or economical to confide the matter of sick-transport to the ingenuity of troops; for in the medical service of armies, if the difficult problems concerning the transport of sick and wounded men, with due care for the safety of their lives and alleviation of their sufferings, are not sudied out in advance, there will be great detriment, on numerous occasions in campaigning, to the efficiency of the fighting force. Experience having demonstrated that some other mode of transport than by hand-litters and wheel-vehicles is imperatively necessary, it is important to determine the best method. Assuredly this cannot be the devotion of two animals and four soldiers to the carriage of the sick man. As it is known that in countries varying in climate and geographical configuration as Algeria, Russia, Italy, and Mexico, it has been found possible to transport two wounded men by one mule, and that only one muleteer was needed for every two mules, the utility and economy of such an arrangement are so obvious, that—notwithstanding the expense and systematic care required to provide animals of sufficient strength and docility, and men adequately instructed in the training of the animals and care of the wounded—it would be possible and desirable to renew the attempt to secure its advantages, as has been successfully accomplished in other armies." An opinion few will differ with who have had any experience of actual warfare.

We commend this interesting and excellently illustrated report to the notice of military surgeons of all armies, as containing much practical information on the carriage of sick and wounded troops in inhospitable and mountainous regions.

Medical News.

Royal College of Surgeons in Ireland.—The undernamed gentlemen passed the required examination for the First-Half of the Letters Testimonial of the Colleges at the examinations held on the 7th of July and following days, viz. :—Alfred Ausbery, Henry Banks, Thomas W. Beale, Edward Butt, John Carmichael, John J. Daly, Maurice O'Connor Drury, Albert J. Duffey, Constantine R. Egan, John English, John R. Hamilton, Richard J. Hassard, Edward C. Hynes, Denis M'Donnell, John R. M'Munn, Edward Morissy, John W. Mullen, Hairy O'Hara, Patrick J. O'Shaugh, nessy, William J. Patton, Bernard Reddy, Thomas Ryan, Thomas Sheedy, Simon D. Sproule, Alfred Vavasour Lane, Henry A. Wall, Cicel G. Westropp, and Vincent S. White.

At the examination held in General Education on the 18th July the undernamed gentlemen were awarded certificates, viz. :—Herbert J. Bermingham, Walter Boyd, Humphry J. Bloomfield, George V. Byrne, Arthur C. Clance, Robert Heron, Francis Philip Colgan, Anthony L. Courteney, Louis Finigan, Edward T. Geoghegan, Nicholas J. Hannan, Samuel W. Handy, George H. Harding, John Hare, James Heath, Robert Hickson, John T. Holmes, James J. H. Jackman, William G. Kennedy, Patrick A. Keogh, Thomas S. Lacy, Peter E. Lemas, Thomas Magnor, Daniel J. Manning, Thos. R. M'Dermott, William M'Geoghegan, Henry S. M'Gill, Philip M'Patton, Thomas Mulcahy, George C. Moutray, Edward De Lacy Wickham, Robert A. Williams, and Samuel R. Wills.

At the examination held on the 23rd of July and following days the undermentioned gentlemen, having passed the required examinations for the diploma, and having made and subscribed the declaration, were admitted Licentiates of the College, viz. :—Thomas F. Arthur, William H. Bagnell, Joseph J. Beattie, Thomas V. Bell, Edward J. L. Blacker, James Bothwell, Patrick J. Carmody, Henry A. H. Carleton, Patrick J. Collins, William R. Cooper, Thomas Curran, Louis Delmege, William G. Evans, David A. M. Finlay, John R. Hamilton, William H. de Burgh Hoctor, Matthew Kehoe, Laurence Kerrigan, Edward G. Leary, William B. Mackey, Bartholomew Madigan, Joseph M'Cann, Edward P. M. Donnell, John W. Mullen, Robert O'Callaghan, David W. Orr, Daniel O'Sullivan, Benjamin Poirotte, Samuel Russell, Henry R. Sherrard, Thomas P. Sillard, Andrew C. Thompson, Edmund J Thunder, Thomas G White, and John B Yourell,

Royal College of Surgeons of England.—The following gentlemen, having passed the required examination, were duly admitted members of the College at the last meetings of the Court of Examiners :—

At the Annual Meeting of the General Council of the Apothecaries' Hall of Ireland, convened in pursuance of the Statute of Incorporation, on the 1st day of August, 1877, the following members were elected as the office bearers for the ensuing year :—Governor, James Shaw, L.R.C.S.I. Deputy-Governor—Henry Palmer Nolan, M.D. Court of Directors and Examiners.—Edward Howard Rolland, M.D., M.R.C.S.E.; Thomas Collins, M.R.C.S.E; John Evans, Esq.; Arthur Harvey, Esq.; Charles Holmes, M.D.; Charles H. Leet, M.D., M.C.; Charles F. Moore, M.D., F.R.C.S.I.; Robert Montgomery, M.R.C.S.E.; Jerome O'Flaherty, L.R.C.S.I.; Edward J. O'Neill, M.D., L.R.C.S.I.; George B. Owens, M.D.; John Ryan, M.D., M.R.C.S.E.; George Wyse, M.D. Examiners in Art.—John W. Moore, M.D. T.C.D.; Edward W. Collins, M.D. T.C.D. Representative on the General Medical Council—Dr. Charles Henry Leet.

NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in Loadon, Dublin, or Edinburgh.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal

regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Dr. Dolan, Halifax.—Paper received will appear as soon as possible.

Inquirens.—A knowledge of French is certainly desirable if you wish to attend the Geneva Congress; if you have no objection to figure as a dummy with the object of impressing your *clientele* on your return, by all means go. We have already given the subjects of the papers, and, if space permits, will also furnish the provisionary conclusions.

Mr. E. M. Boddy.—Your communication shall appear as soon as space permits.

Dr. Williams will find the subject referred to in our issue of July 25.

Talipes.—1. There is an orthopædic hospital in Dublin. 2. Dr. Sayre, of New York, is now in England.

Accoucheur.—You will find plates of Tarnier's forceps in Medical Press, May 9, p. 371. We were the first to introduce them to English readers. Their probable cost would be about £2 17s.

An Interested One.—The Lunacy Commission has not furnished its inquiry, but has adjourned to next session.

Not behind the Scenes.—Of course the reports in some of our contemporaries as to the health of H.R.H. Prince Albert Victor are what Carlyle would call "shams," they are written "ad captandum vulgus." Would you consider it professional or honourable to give to the public all particulars about your private patients. Should not royalty have the same privileges as are accorded to the subject? When you see such reports you may rest assured the writers of them know no more than the general public, as the medical attendants on royal patients are not likely to betray their trust.

General Practitioner.—We would prefer another *nom de plume*. Write to the General Secretary.

Dr. Kelly's communication will receive our attention.

To the Editor of the Medical Press and Circular.

Sir,—My attention has been called to an article in your issue of July 11th, anent the debate on vaccination in the House of Commons, in which you recommend that the father of an unvaccinated child dying of small-pox should be indicted for manslaughter. May I ask if you would also recommend that the doctor should be indicted for the same offence in every case of a failure of vaccination to give "protection from death by small-pox?"

I am, respectfully,
A. Wheeler.

6 Blackwellgate, Darlington,
August 3, 1877.

[We are surprised that Mr. Wheeler does not see the difference between a man who conscientiously performs a duty, although, perhaps, unsuccessfully, and one who wilfully neglects a duty in the face of serious and even fatal consequences. To say that a vaccinator should be punished because the person he vaccinated caught the small-pox, is as absurd as to say that a surgeon should be punished for an unsuccessful operation.—Ed. M. P. & C.]

"THE VIN DE BAUDON."

To the Editor of the Medical Press and Circular.

Sir,—My attention having been called to an advertisement of the Vin de Baudon in which my name is mentioned in such a manner as to beget the idea that I had employed this compound, that to its employment I had ascribed the recovery of a patient from empyema, and that I recommended its use. Perhaps you will kindly permit me to state in answer to many communications on the subject, that the wine was prescribed by the Resident Medical Officer of the London Hospital, that in my opinion its use exerted no favourable influence upon the patient's recovery, that I have never prescribed the preparation, that the garbled extracts from the reports of the case—neither written nor revised by me—used by the advertisers to promote the sale of their commodity, have been published without my knowledge, and that the continued use of the advertisement as it now runs is contrary to my judgment of what is right.

I have the honour to be, Sir,
Your obedient servant,
Andrew Clark, M.D.,
Aug. 6, 1877. Physician to the London Hospital.

[*** We are sorry to see advertisers, in their anxiety to push their wares, resort to such a reprehensible device as that so justly exposed by Dr. Clark; and we consider that they should at once withdraw the objectionable references. The advertisement has not appeared in our columns, although we understand from our Publisher that an order was offered some time since on condition of a notice first appearing in the Medical Press. A few weeks ago the agents of a certain food for infants also had to be taken to task for using in their advertisements a testimonial given by a physician years ago for another purpose. We are not now offering an opinion on the merits or demerits of these articles, nor do we consider that, where a preparation or an instrument has been found of real value, a medical man should not give it the recommendation it deserves; but it is these "tricks in trade" tricks which would not for an instant be tolerated by well-known and established firms, that we condemn, and we have no hesitation in adding these two to the category.—Ed. M. P. & C.]

Mr. Duncan McNab.—Received as we were going to press.

BOOKS, PAMPHLETS, AND MEDICAL JOURNALS RECEIVED.

A Manual of Orthopraxy. Third Edition. By Hy. Heather Bigg, C.E. London: J. & A. Churchill.

The Hair in Health and Disease. By E. W. Cottle, F.R.C.S. London: J. & A. Churchill.

A Report on the Sanitary Condition of Birkenhead. By F. Vacher, Medical Officer of Health.

The Transport of Sick and Wounded by Pack Animals. By George A. Otis, United States Army Medical Department.

On the Diagnosis of Urethral Stricture by Bulbous Bougies. By J. W. White, M.D., Philadelphia.

Cyclopædia of the Practice of Medicine. Edited by Dr. H. von Ziemssen. Vol. XV. London: Sampson, Low, & Co.

VACANCIES.

Royal Free Hospital, Gray's Inn Road, W.C.—Assistant Physician and Assistant Surgeon. Honorary. Testimonials to Mr. Blyth, Secretary. (See Advt.)

Westminster Hospital.—House Physician, House Surgeon, Obstetric Assistant. Board and lodging furnished for each appointment, but no salary. Applications to the Secretary.

Wilts County Lunatic Asylum.—Assistant Medical Officer. Salary, £110, with board. Applications to the Clerk of the Visitors, Devizes.

Tamworth Union.—Medical Officer of Health for Rural Sanitary Board. Salary, £120. Also Medical Officer to the Union Workhouse and District. Salary, £105, with fees extra. Sealed applications to the Clerk to the Union.

South Yorkshire Lunatic Asylum.—Assistant Medical Officer. Salary, £100, with board and apartments. Address Dr. Mitchell, Wadsley, near Sheffield.

Ennistymon Union, Miltown, Malbay Dispensary.—Medical Officer. Salary, £100. Election, Aug. 8.

Queenstown Dispensary.—Resident Apothecary. Salary, £70 per annum, with perquisites amounting to £45. Election, Aug. 29.

Cavan Union, Ballananagh Dispensary.—Medical Officer. Salary, £100 per annum. Election, 18th inst.

Kent and Canterbury Hospital.—House Surgeon. Salary, £80, with board, &c. Applicants must address the Secretary.

Tunbridge Wells Dispensary.—Dispenser. Salary, £80, with furnished rooms, &c. Address W. C. Satchell, Esq., 1 Monson Place, Tunbridge Wells.

St. Mary's Hospital, Paddington.—Pathologist and Medical Tutor. Salary, £100. Full particulars of the Dean.

North Witchford Union, Cambridgeshire.—Medical Officer for the Manea District. Salary, £50, with extra fees for midwifery, vaccination, &c. Address the Clerk to the Guardians.

Roscommon Infirmary.—Resident Apothecary and Registrar. Salary, £60 per annum, with apartments, &c. Election, 17th inst.

APPOINTMENTS.

Cantlie, Dr. J., Demonstrator of Anatomy at the Charing Cross Hospital Medical School.

Curwen, C., M.R.C.S.E., House Surgeon to the Male Lock Hospital.

Dean, T. N., M.R.C.S.L., Consulting Surgeon to the Ardwick and Ancoats Hospital, Manchester, on resigning as Honorary Surgeon.

Friend, F. W., M.R.C.S.E., Medical Officer for the Hoxne District of Hoxne Union, Suffolk.

Joule, Mr. J. S., Physician's Assistant and Pathologist to the Wolverhampton and Staffordshire General Hospital.

Laver, H., M.R.C.S.E., Surgeon to the Essex and Colchester Hospital.

Nunn, T. W., F.R.C.S.E., Consulting Surgeon to the City Provident Dispensary and Surgical Appliance Association.

Palmer, T. D., L.R.C.P.Ed., L.F.P.S.G., Medical Attendant to the Royal Irish Constabulary, Sligo, and Surgeon to the Duke of Connaught's Artillery Militia.

Partridge, J. H., M.R.C.S.E., a Consulting Surgeon to the Essex and Colchester Hospital, upon retiring in accordance with the rules.

Riordan, T. F., M.D., Resident Medical Officer and Apothecary to the Cork Union Workhouse.

White, W., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Officer to the Workhouse, Celbridge Union, co. Kildare.

Marriages.

Holmes—Coqui.—July 25, at St. George's, Bloomsbury, London, Dr. W. Gordon Holmes, to Maria Therese, third daughter of Adolph Coqui, formerly of Natal.

Macfee—Cross.—Aug. 2, at the Parish Church, Hackney, John Macfee, M.D., to Anne Eliza, eldest daughter of the late John Cross.

Deaths.

Bradley.—On July 23, at High Bentham, Yorkshire, John Bradley, M.R.C.S.E., aged 33.

Dalgairns.—On July 25, at St. Mildred's, Weston-on-Sea, Dr. Charles Anderson Dalgairns, aged 52.

Davies.—On July 23, at Holywell, John Davies, formerly House Surgeon at the Flintshire Dispensary, aged 35.

Foot.—On July 22, at Ludwell, Wilts, Stephen Foot, Surgeon, in practice prior to August, 1815, aged 80.

Forbes.—On July 24, at Greenbank, Auchterarder, Alexander Forbes, M.D., aged 67.

Gimlette.—On Aug. 1, at Southsea, Hart Gimlette, M.D., Fleet Surgeon R.N., aged 54.

Handy.—On July 28, at Killala, co. Mayo, of typhus fever, Samuel Wesley Handy, M.D., aged 37.

Moir.—On July 17, at Strathblane, John Moir, M.B., aged 23.

Noad.—On July 23, at Lower Norwood, Henry M. Noad, Ph.D., F.R.S., Professor of Chemistry at the St. George's Hospital Medical School, aged 62.

Reeve.—On July 24, at Upper Norwood, J. Foster Reeve, M.R.C.S.E., aged 87.

Reith.—On July 16, at Fetteresso, John Reith, Surgeon, aged 69.

Walker.—On July 20, at Dumfries, James Walker, M.D., late of Cupar, Fifeshire.

Williams.—On June 24, at St. Martin's, Colchester, Edward Williams, M.D., aged 69.

ADDRESS IN MEDICINE,

By William Roberts, M.D., F.R.C.P., F.R.S.,

Physician to the Manchester Royal Infirmary; Professor of Clinical Medicine in Owens College, &c.

THE DOCTRINE OF CONTAGIUM VIVUM AND ITS APPLICATIONS TO MEDICINE.

Gentlemen,—The notion that contagious diseases are produced by minute organisms has prevailed in a vague way from a remote age; but it is only within the last twenty years—since the publication of Pasteur's researches on fermentation and putrefaction—that it has assumed the position of a serious pathological doctrine. In the last decade startling discoveries of organisms in the blood have given this doctrine the support of actual observation; and its application as a guide in the treatment of wounds by Professor Lister has made it a subject of universal interest to medical practitioners.

The resemblance between a contagious fever and the action of yeast in fermentation—or the action of bacteria in decomposition—is in many points so striking that it is difficult to avoid the impression that there is some real analogy between them. If, for example, we compare the action of yeast with small-pox, this resemblance comes out very distinctly, as the following experiment will show. I filled two pint bottles, A and B, with fresh saccharine urine, and inserted a delicate thermometer in each. A was inoculated with a minute quantity of yeast, but nothing was added to B. Both bottles were then placed in a warm place in my room, at a temperature of about 70° Fahr. In order to get a correct standard of temperature for comparison, I placed beside these a third bottle, C, filled with water, and inserted a delicate thermometer in it. All these bottles were carefully swathed in cotton-wadding, for the purpose of isolating their individual temperatures, and to obviate as much as possible the disturbing effects of the varying temperature of the room. For twelve hours no change took place; but at the end of this time A began to ferment, and the thermometer marked a distinct elevation of temperature. On the second day A was in full fermentation, and its temperature was 2·7 deg. above B and C. This disturbance continued for five days, the temperature ranging from two to three degrees above the companion bottles. The disturbance then subsided, and the temperature fell to an equality with B and C, and a considerable sediment, composed of yeast, settled at the bottom. In the meanwhile B showed little alteration; but on the sixth day it began to ferment, the temperature went up, and for more than a week its thermometer stood about two degrees above A and C. Finally, the temperature in B declined, the disturbance subsided, and the newly-formed yeast settled to the bottom of the vessel.

The fever in a bottle resembled small-pox in the following points:—A period of incubation intervened between inoculation and the commencement of disturbance; then followed a period of disturbance accompanied by elevation of temperature; this was succeeded by a subsidence of the disturbance and a return to the normal state. Great multiplication of the infective material (or yeast) took place during the process, and after its conclusion the liquid was protected from further infection with the same contagium. We likewise notice that the contagium of fermentation, like that of small-pox, may take effect either by direct purposive inoculation or by fortuitous infection through the atmosphere. In both cases the infective material has the power of preserving its activity for an indefinite period. The comparison fails in at least one important point—in the fermented urine sugar is replaced by alcohol and carbonic acid, but we are not aware that any pronounced chemical changes occur in the blood or tissues during an attack of small-pox. I would, moreover, carefully guard myself against being supposed to suggest that the enhanced temperature in the fermenting urine is a real analogue of the preternatural heat of fever.

Let me direct your attention to another example—a kind of partial decomposition or fermentation which takes place in boiled hay-infusion when it is inoculated with the *Bacillus subtilis*. The *Bacillus subtilis* is a very common bacterium, found in vegetable infusions and in curdling milk. I hope you will take note of this little organism;

for I shall have to refer to it more than once in the course of this address. I took a flask containing hay-infusion which had been sterilised by boiling, and inoculated it with a drop of fluid swarming with *Bacillus subtilis*. After the lapse of twenty-four hours the previously transparent infusion became turbid. This turbidity increased, and on the second day a film or crust formed on the surface of the infusion. On the third and subsequent days, the crust broke up, and fell in pieces to the bottom of the vessel. In about a fortnight the turbidity passed away, and the original transparency of the infusion was perfectly restored, so that it looked exactly as it did before the process began, except that there was now a sediment consisting of the spores of the little organism at the bottom of the flask. In this case, again, there was the same succession of events—a period of incubation, followed by a period of disturbance, succeeded by a period of subsidence, and, finally, restoration to the normal state. There was also great increase of the infective material and immunity from further attack by the same contagium.

The yeast-plant and the *Bacillus subtilis* may be taken as representatives of a large class of organisms, in regard to which we are only beginning to realise their vast importance in the economy of Nature and in the life of man. They are, as I shall presently show, the essential agents in all fermentations, decompositions, and putrefactions. We may group them together, for the convenience of description, under the general designation of *saprophytes*—a term intended to include, under one heading, all the organisms associated with the decomposition and decay of organic matter. The yeast-plant and its allies, and all the numerous species and varieties of bacteria, belong to this group. In size and form they are among the smallest and simplest of living things, but their vital endowments are wonderful.

All the organisms hitherto found associated with infective inflammations and contagious fevers belong to the tribe of bacteria, and we cannot advantageously enter on a study of that association without a knowledge of the origin and attributes of these organisms. This brings us into a field of active controversy. It has been alleged, as you know, on high authority, that these organisms, under certain conditions, depart entirely from the universal law of generation, which is expressed in the aphorism *omne vivum è vivo*, and that they may arise spontaneously by a process of abiogenesis. It is also alleged that these organisms are not the actual agents of decomposition, but are merely associated with that process as secondary or accidental accompaniments. I propose to lay before you evidence that both these allegations are unsustainable, and to prove that bacteria, like other organisms, arise from pre-existing parent germs, and in no other way, and that they are the actual agents in all decomposition and putrefaction.

The first proposition I shall endeavour to establish is this: that organic matter has no inherent power of generating bacteria, and no inherent power of passing into decomposition.

I have here placed before you samples of three sets of preparations, out of a large number in my possession, which serve to substantiate this proposition.

The first set consists of organic liquids and mixtures which have been rendered sterile by a sufficiently prolonged application of the heat of boiling water. They are composed of infusions of vegetable and animal substances, fragments of meat, fish, albumen, and vegetables floating in water. They are contained in oblong glass bulbs, and are protected from the dust of the air by a plug of cotton wool inserted into the necks of the bulbs, but freely open to its gaseous elements, which pass in and out through the cotton-wool. They are all, as you see, perfectly transparent and unchanged, though most of them have been in my possession for several years.

The second set consists of organic liquids which have been simply filtered under pressure through unglazed earthenware into sterilised flasks. They include acid and neutralised urine, albuminous urine, diluted blood, infusions of meat and of hay. As these preparations were obtained by a method which is in some respects new, I will describe it to you. A piece of common tobacco-pipe, about six inches long, served as the filter. This was secured by india-rubber piping to the exit-tube of one of the little flasks used by chemists for fractional distillation. The flask is first charged with distilled water, and then a tight plug of cotton-wool is inserted into its neck. The flask is next set a-boiling briskly over a lamp. The steam rushes through the cotton-wool plug and through the tobacco-pipe, clearing both these passages of any germs they might contain. When the water has nearly boiled away, the end of the tobacco-pipe is hermetically sealed with melted sealing-wax. After a little more boiling the flame is withdrawn, and the neck of the flask is instantly closed with a tight vulcanite cork. The apparatus is now ready for action, and the tobacco-pipe is immersed in the liquid to be filtered. When the flask cools, a vacuum is created within it, and this serves as a soliciting force to draw the liquid through the earthenware into the flask. The process of filtration is very slow; it takes two or three days to charge the flask. When a sufficiency has come over, the apparatus is removed and placed on a shelf for a few days, until the pressure inside and outside the flask is equalised. The vulcanite cork is then withdrawn, and the exit-tube is separated and sealed in the flame of a lamp. In this way you obtain a sterilised flask charged with the filtered organic liquid, and protected from outside contamination by a plug of cotton-wool. Preparations obtained in this way, if due precautions have been used in the manipulation, remain permanently unchanged; organisms do not appear in them, and decomposition does not ensue.

The third set of preparations are in some respects the most significant of the three. They consist of organic liquids which have been simply removed from the interior of the living body, and transferred, without extraneous contamination, into purified glass vessels. I will not detain you with the methods employed to obtain them; it is sufficient to say that, by the use of proper precautions, it is possible to convey blood, pus, urine, ascitic fluid, pleuritic effusion, blister serum, or the contents of an egg into sterilised glass vessels without contact with any infecting agency. Preparations thus obtained are exhibited in these flasks; they are protected from air-dust by a simple covering of cotton-wool. All of them are absolutely free from organisms and from any signs of decomposition.

What meaning can we attach to these preparations? You all know that liquids and mixtures such as these speedily decompose, and swarm with organisms, when left to themselves exposed to the air. They are of most varied composition, and the most apt of all known substances to breed bacteria and to become decomposed. They have been exposed to the most favourable conditions in regard to warmth, moisture, and air. Many of them have been in my possession several years, and all of them for several months, yet they are wholly barren and without sign of decomposition. I venture to say that these preparations substantiate in a positive manner the proposition with which we started—namely, *that organic matter has no inherent power of generating bacteria, and no inherent power of passing into decomposition.*

A second proposition is likewise established by these preparations—namely, *that bacteria are the actual agents of decomposition.*

In all the preparations, the absence of bacteria coincides with the absence of decomposition. If I were to cause bacteria to appear in them, either by purposive infection or by exposing them to the unfiltered air, decomposition would infallibly follow. The filtration experiments supply a new and telling argument on this point. Some of the liquids became decomposed and full of bacteria while the filtration was going on, but the part which came over into the flasks remained without further change, showing that decomposition cannot go on without the actual contact of the living organisms.

We have next to ask ourselves, What are the sources and what is the nature of the fecundating influence which causes organic liquids, when abandoned to themselves without protection, to become peopled with organisms? In regard to their source, the answer is not doubtful. If I remove the covering of cotton-wool from any of these preparations, and admit unfiltered air, or a few drops of any ordinary water, however pure, or anything that has been in contact with air or water, organisms make their appearance infallibly in a few hours. As to the nature of the infective agents, we can say positively that they must consist of solid particles, otherwise they could not be separated by filtration through cotton-wool and porous earthenware. Is it not a most natural inference that they are the parent germs of the brood which springs up at their impact? They are, however, so minute that we cannot identify them as such under the microscope; but Professor Tyndall has demonstrated that air which is optically pure—that is, air which is free from particles—has no fecundating power.

It is contended in some quarters that these particles are not living germs of any sort, but simply particles of albuminoid matter in a state of change which, when they fall into an organic liquid, communicate to it their own molecular movement, like particles of a soluble ferment, and so produce decomposition, which, in its turn, provides the conditions necessary for the abiogenic generation of bacteria. Filtration through porous earthenware furnishes a complete answer to this theory; for I found on trial that the soluble ferments passed with ease through the porous earthenware. If, therefore, this theory were true, the filtered liquids, if already commencing to be decomposed, would go on decomposing, and would develope bacteria after infiltration; but instead of that they remained unchanged and barren. We are absolutely driven to the conclusion that these particles are living germs: no other hypothesis squares in the least degree with the facts of the case.

* * * * * *

We now approach the more practical side of our subject—that which concerns us as practitioners of medicine and students of pathology. I have already directed your attention to the analogy between the action of an organised ferment and a contagious fever. The analogy is probably real, in so far, at least, that it leads us to the inference that contagium, like a ferment, is something that is alive. We know of nothing in all our experience that exhibits the phenomena of growth and self-propagation except a thing possessed of life.

This living something can only be one of two things; either it is an independent organism (a parasite) multiplying within the body or on its surface, or it is a morbid cell or mass of protoplasm detached from the diseased body and engrafted on the healthy body. Possibly, both these conceptions may have their application in the explanation of different types of infective diseases. In regard to the latter conception, however—the graft theory—which has been so ably developed by my friend Dr. Ross, I will only say that it has not, as yet, emerged from the region of pure speculation. It lacks an established instance or prototype; and it fails to account for the long enduring dormant vitality so characteristic of many contagia, which conforms so exactly with the persistent latent vitality of seeds or spores, but which contrasts strongly with the fugitive vitality of detached protoplasm.

If, then, the doctrine of a contagium vivum be true, we are almost forced to the conclusion that a contagium consists (at least, in the immense majority of cases) of an independent organism or parasite, and it is in this sense alone that I shall consider the doctrine.

It is no part of my purpose, even if I had the time, to give an account of the present state of knowledge on this question in regard to every contagious disease. My object is to establish the doctrine as a true doctrine—to produce evidence that it is undoubtedly true in regard to some infective inflammations and some contagious fevers. In an argument of this kind it is of capital importance to get hold of an authentic instance, because it is more than probable—looking to the general analogy between them—that all infective diseases conform in some fashion to one fundamental type. If septic bacteria are the cause of septicæmia—if the spirilla are the cause of relapsing fever—if the *Bacillus anthracis* is the cause of splenic fever—the inference is almost irresistible that other analogous organisms are the cause of other infective inflammations and of other specific fevers.

I shall confine my observations to the three diseases just named—septicæmia, relapsing fever, and splenic fever—merely remarking that, in regard to vaccinia, small-pox, sheep-pox, diphtheria, erysipelas, and glanders, the virus of these has been proved to consist of minute particles having the character of micrococci; and that, in regard to typhus, scarlet fever, measles, and the rest of the contagious fevers, their connection with pathogenic organisms is as yet a matter of pure inference.

Septicæmia.—We will first inquire how it stands with this doctrine in regard to traumatic septicæmia and pyæmia. You are all aware that foul, ill-conditioned wounds are attended with severe, often fatal, symptoms, consisting essentially of fever of a remittent type, tending to run on the formation of embolic inflammations and secondary abscesses.

The notion that septicæmia is produced by bacteria, and the *rationale* of the antiseptic treatment which is based thereupon, is founded on the following series of considerations.

1. It is known that decomposing animal substances—blood, muscle, and pus—develope at an early stage of the process a virulent poison, which, when injected into the body of an animal, produces symptoms similar to those of clinical septicæmia. This poison is evidently not itself an organism; it is soluble, or, at least, diffusible in water, and it is capable, by appropriate means, of being separated from the decomposing liquid and its contained organisms. When thus isolated it behaves like any other chemical poison; its effects are proportionate to the dose, and it has not the least power of self-multiplication in the body. To this substance Dr. Burdon-Sanderson has given the appropriate name of pyrogen. It is the only known substance which produces a simple uncomplicated paroxysm of fever—beginning with a rigor, followed by a rise of temperature, and ending, if the dose be not too large, in defervescence and recovery.

2. We know further, from the evidence I have laid before you, that decomposition cannot take place without bacteria, and that bacteria are never produced spontaneously, but originate invariably from germs derived from the surrounding media. We are warranted by analogy in regarding pyrogen as the product of a special fermentation taking place in decomposing albuminoid mixtures, but we cannot name the particular organism nor the particular albuminoid compound which are mutually engaged in the process.

3. In the third place, we know that when a wound becomes unhealthy, as surgeons term it, the discharges become offensive—in other words, decomposed—and when examined under the microscope they are found to swarm with organisms resembling those found in all decomposing fluids. Meanwhile the patient becomes feverish, and suffers from the train of symptoms which we call septicæmia.

It is a natural inference that what takes place in decomposing blood or muscle in the laboratory takes place also in the serous discharges and dead tissues of the wound. These become infected from the surrounding air, or from the water used in the dressings, with septic organisms; on that follows decomposition and the production of the septic poison, or pyrogen; the poison is absorbed into the blood, and septicæmia ensues.

It was the distinguished merit of Lister to perceive that these considerations pointed to a means of preventing septicæmia. He argued that if you could prevent the access of septic organisms to the wound, or destroy them there, you would prevent decomposition, prevent the pro-

duction of the septic poison, and thus obviate the danger of septicæmia. It is not within the scope of this address to describe the means by which Lister attained this object, still less to pass judgment on his practice, but I may be permitted to express my belief that the principle on which the treatment is founded is unassailable.

We should probably differ less about the antiseptic treatment if we took a broader view of its principle. We are apt to confound the principle of the treatment with Lister's method of carrying it out. The essence of the principle, it appears to me, is not exactly to protect the wound from the septic organisms, but *to defend the patient against the septic poison.* Defined in this way, I believe that every successful method of treating wounds will be found to conform to the antiseptic principle, and that herein lies the secret of the favourable results of modes of treatment which at first sight appear to be in contradiction to the antiseptic principle. Take, for example, the open method of treating wounds which is sometimes compared in its results with Lister's method. What is this treatment but another way (only less ideally perfect than Lister's) of defending the patient against the septic poison? Because, if the surgeon succeeds in providing such free exit for the discharges that there is no lodgment of them in the wound, either they pass out of it before there is time for the production of the septic poison, or if any be produced, it escapes so quickly that there is not enough absorbed to provoke an appreciable toxic effect.

Before we can understand the pathology of septicæmia we must have clear ideas on the relation of septic bacteria to our bodies. We see in old laboratories that dead animal tissues, when exposed to ordinary air or ordinary water, invariably breed septic organisms ; in other words contact of the septic germs with the dead tissues never fails to produce successful septic inoculation. But it is quite otherwise with the same tissues when alive and forming part of our bodies. You cannot successfully inoculate the healthy tissues with septic bacteria. It has been proved over and over again that these organisms, when separated from the decomposing medium in which they grow, can be injected in quantity into the blood or tissues of a healthy animal, or applied to a sore on its skin, without producing the least effect. The healthy living tissues are an unsuitable soil for them ; they cannot grow in it ; or, to put it in another way, ordinary septic bacteria are not parasitic on the living tissues.

This fact is of fundamental importance in the discussion of the pathology of septicæmia. We have a familiar illustration of its truth in the now common practice of subcutaneous injection. Every time you make a subcutaneous injection you inject septic germs into the tissues. I had the curiosity to test this point with the morphia solution used for this purpose in the Manchester Infirmary. I injected five drops of this solution into four flasks of sterilised beef-tea which had remained unchanged in my room for several months, taking care to avoid any other source of contamination. In forty-eight hours they were all in full putrefaciton. But we know that no such effect follows when similar injections are made into the bodies of our patients.

It seems also probable that septic organisms enter constantly into our bodies with the air we breathe and the food we take ; they pass, presumably, like any other minute particles, though the open mouths of the lymphatics and lacteals, and penetrate some distance into these channels ; they certainly come in contact with the accidental cuts, sores, and scratches which so often bedeck our skins. Notwithstanding all this, our bodies do not decompose ; indeed, if ordinary septic organisms could breed in the living tissues as they do in the same tissues when dead, animal life would be impossible, every living creature would infallibly perish. How these organisms are disposed of when they do enter our bodies accidentally, as it were, in the various ways I have suggested, we cannot say ; we can only suppose that they must speedily perish, for we find no traces of them in the healthy blood and healthy tissues. (*a*).

Bearing in mind, then, that ordinary septic organisms cannot breed in the living tissues, unless, at least, they are reduced to near the moribund state ; bearing also in mind that there is a sharp distinction to be drawn between the septic poison and the organisms which generate it, we are in a better position to consider the course of events in a wound, which leads on to septicæmia and pyæmia. What probably takes place is this : An unprotected wound receives infection from the septic organisms of the surrounding media. If the discharges are retained in the sinuosities of the wound, decomposition of them sets in with production of the septic poison. This is absorbed into the blood, a toxic effect follows, and septicæmia is established. As this effect increases with the continuous absorption of the poison, the vitality of the system is progressively lowered, and especially the vitality of the tissues bordering the wound, which may be topically affected by the poison which percolates through them. These tissues at length become moribund or die outright ; the septic organisms then invade and breed in them, more septic poison is produced and absorbed ; the toxæmia becomes intense, embolic centres of inflammation and suppuration are formed, and the end comes. In all this history there is no necessity to assume, nor even a probability, that septic organisms invade, or at least multiply in, the blood. They may do so at the near approach of death, but scarcely before that period.

In the course of traumatic septicæmia there sometimes occurs an event of great importance which imparts a new feature to the disease ; I mean *infectiveness.* How this arises is a matter of speculation. To me it appears probable that, under a certain occurrence of conditions in and about the wound, a modification takes place in the vital endowments of the septic organism, whereby it acquires a parasitic habit, which enables it to breed in tissues of degraded vitality or even in the healthy tissues, and in this way to produce the infective endemic pyæmia which we sometimes witness in the wards of our large hospitals. (*b*). I shall develop this idea more fully bye and bye.

Before leaving the subject of septicæmia, I may allude to the possibility of wounds being infected with septic organisms from within. As a rare occurrence, I am inclined to think that this is possible, and that it may account for the occasional alleged infection of protected wounds. From an observation by Chauveau, it may be inferred that septic organisms, when injected directly into the blood, are able to survive for two or three days, although unable to breed there. (*c*) It is conceivable that occasionally a septic germ entering the body in some of the ways which have been suggested may escape destruction and pass into the blood and lurk there awhile, and finding by chance some dead tissue or liquid within its reach, may multiply therein and produce septic effects. Such a contingency, if it ever occur, must be very rare, and would not appreciably detract from the value of the antiseptic mode of dressing wounds.

Relapsing Fever.—In 1872, Dr. Obermeier, of Berlin, discovered minute spiral organisms (spirilla) in the blood of patients suffering from relapsing fever. This discovery has been fully confirmed by subsequent observations. The organisms are found during the paroxysms ; they

(*a*) Exception must apparently be made in regard to the tissues and organs in the immediate vicinity of the absorbent surfaces. Both Klebs and Burdon Sanderson found that portions of the liver and kidneys removed from the body without extraneous contamination, produced bacteria, contrasting in this respect with the blood and muscles.—*British Medical Journal,* February 13th, 1875.

(*b*) Such a modification or "variation" might be correlated with a modification of the ferment action, whereby a more virulent septic poison is produced. Would not such a view explain the sudden intensification of the infecting virus which was found by Chauveau and Dr. Sanderson in their experiments on infective inflammations ?

(*c*) *Comptes Rendus,* 1873, p. 1092.

disappear at the crisis; and are absent during the apyrexial periods.

The drawings represent the various appearances presented by these little parasites. They consist of spiral fibrils of the most extreme tenuity, varying in length from two to six times the breadth of a blood corpuscle. In the fresh state they move about actively in the blood. They have not been detected in any of the fluids or secretions of the body except the blood, nor in any other disease than relapsing fever. In form and botanical characters they are almost identical with the *Spirochaete plicatilis* of Ehrenberg (*Spirillum* of Dujardin), a species of bacteria found in dirty water and occasionally in the mucus of the mouth. Cohn designated the variety found in the blood *S. Obermeieri*, in honour of its discoverer.

In the beginning of the current year, Dr. Heydenreich (*c*) of St. Petersburgh, published an elaborate monograph on this subject, which, I think, goes far to reconcile the conflicting statements and opinions put forth by previous writers in regard to the connection of the spirilla with relapsing fever. It is based on forty-six cases; these cases were studied with the most minute care; the blood was examined, and the temperature observed from two to six times each day. Altogether, over a thousand examinations of the blood were made.

Relapsing fever still prevails extensively in certain districts of Germany and Russia, but it is almost a forgotten disease in this country; and probably the majority of those in this room have never seen a case. It will, therefore, not be amiss if I remind my hearers, and myself, of its principal features. It is a contagious epidemic fever, characterised by a sharp paroxysm of pyrexia, which lasts about a week, and ends with a severe critical sweating. This is succeeded by an intermission, also of about a week, during which the patient is apyrexial; then follows a second paroxysm, or relapse, which lasts four or five days, and ends, as before, in a critical sweating. Recovery usually follows the second paroxysm, but not unfrequently a third paroxysm occurs, and sometimes a fourth.

The paroxysms are occasionally broken by remissions or pseudo-crises; and the apyrexial periods are sometimes interrupted by slight temporary rises of temperature.

Bearing these characteristics in mind, we shall be able to understand the significance Heydenreich's observations. He found that every rise of temperature, whether that of the true paroxysm, or that following a pseudo-crisis, or those occurring during the intermissions, was invariably preceded by the appearance of spirilla in the blood. They disappeared entirely shortly before the crises, and remained absent during defervescence and the subsequent apyrexial periods. During the whole of the main paroxysms spirilla was usually to be found in the blood, but their number varied in the most puzzling manner from day to day. One day they were abundant, the next day they were scanty, and the day after again abundant; they even varied at different hours of the same day; some times they vanished altogether for a time, and then reappeared in vast numbers a few hours later. Throughout these variations the temperature remained steadily high, or with only slight or moderate oscillations.

These discrepancies had been observed by previous inquirers, and had led some to doubt whether the spirilla had anything to do with the virus of relapsing fever; but a happy idea suggested itself to Heydenreich which seems capable of explaining them.

He found that when a little blood containing spirilla was abstracted from the patient and kept at the ordinary temperature of the room, the organisms lived in it for several days; but if the blood was placed in an incubator and maintained at the normal temperature of the body, they died in from twelve to twenty hours, and if the temperature was kept up to fever heat (104 deg. F.) their life was still shorter; they only survived from four to twelve hours. This led him to the conjecture that during the main paroxysm, not one, but several successive generations of spirilla were born and died before their final disappearance at the crisis. He surmised that in the usual course, the broods would overlap each other more or less, the new brood making its appearance before the last survivors of the old brood had passed away. This explained the variable number of spirilla found on different days and different hours of the same day. Sometimes the old brood would have altogether perished before the new brood reached maturity; this explained the occasional temporary absence of spirilla from the blood; it also explained the remissions or pseudo-crises sometimes observed in the course of the paroxysms. So precise was the correspondence found to be between the appearance of the spirilla and a subsequent rise of temperature, that Heydenreich was able to predict with certainty, during the apyrexial periods, the approaching advent of a transient rise of temperature from the re-appearance of spirilla in the blood, although at the time the patient presented no other indication of what was about to happen.

If these observations are to be relied on—and they appear to have been made with the most scrupulous care—we are led to the conclusion that the spirilla are the actual virus of relapsing fever.

The same conclusion is also strongly indicated by the results of inoculation experiments. Relapsing fever is easily communicated to a healthy person by inoculation with the blood of a patient suffering from the disease. Experiments made in Russia on individuals who voluntarily submitted themselves to this practice, show that the blood is only infective during the paroxysms, but not at the crises or during the apyrexial periods. None of the fluids or secretions of the body except the blood are infective. All this shows that the virus is intimately associated with the spirilla, and is absent or present in exactly the same circumstances as the latter.

The occasionally observed vanishing and re-appearance of the spirilla during the paroxysms, without a possibility of new infection, seems to indicate that when the spirilla disappear they leave behind them something in the nature of seed or spores, from which the new brood springs forth. Ocular evidence of such germs is, however, still wanting. Several observers have noticed minute particles in the blood of relapsing fever which might pass for spores, and Heydenreich observed that some of the spirilla had a dotted appearance. But hitherto all efforts to cultivate the spores out of the body have failed, and their power of developing spores is more an inference than a demonstration.

Splenic Fever.—The first trustworthy observation of the presence of organic forms in an infective disease was made in splenic fever. This formidable disorder attacks sheep, cows, and horses, and is not unfrequently fatal to man. In 1855, Pollender discovered minute staff-shaped bacteria in the blood of splenic fever. This discovery was confirmed in a very extensive series of researches by Brauell, and has been corroborated by Davaine and other inquirers in France.

The bacterium of splenic fever is a short, straight, motionless rod, about as long as the breadth of a blood-corpuscle, and so far as is known, it exists in no other form in the living body. It is found, besides the blood, in the spleen, in the lymphatic glands, and in some other tissues. That this organism is the true virus of splenic fever, has long been probable: and the labours of Davaine, Bollinger, Tiegel, Klebs, and, most of all, of Koch, have removed the last doubts on the subject. The work done by Koch is not only valuable as a triumphant demonstration of a disputed pathological question, but is noteworthy as a model of patient, ingenious, and exact pathological research.

We here come across an example of scientific prescience on the part of two distinguished men which is worth notice. It had been remarked by several observers that the contagium of splenic fever, as it existed in the blood, was comparatively short-lived and fugitive, but that, under some unexplained circumstances, the contagium was very persistent, and lurked for years in stables, and

other places where cattle were kept. Dr. Burdon Sanderson, writing in 1874, inferred from this circumstance that the organisms of splenic fever must have two states of existence; namely, that of the perishable bacteria found in the blood and some other more permanent form, like seeds or spores, in which they were capable of surviving for an indefinite period. In like manner, Professor Cohn, guided by the botanical characters of the rods found in the blood, classed them in that group of bacteria named by him *Bacillus;* and as he had observed that all the *Bacilli* produced spores, he inferred that the *Bacillus anthracis*—for so he named the bacterium of splenic fever—would also be found to produce spores. These previsions were proved by the researches of Koch to be perfectly exact.

* * * * * *

The laws of variation seem to apply in a curiously exact manner to many of the phenomena of contagious diseases. One of these laws is the tendency of a variation, once produced, to become permanent and to be transmitted ever after with perfect exactness from parent to offspring; another and controlling law is the tendency of a variation, after persisting a certain time, to revert once more (under altered conditions) to the original type. The sporting of the nectarine from the peach is known to many horticulturists. A peach-tree, after producing thousands and thousands of peach-buds, will, as a rare event and at rare intervals, produce a bud and branch which ever after bear only nectarines; and, conversely, a nectarine at long intervals, and as a rare event, will produce a branch which bears only peaches ever after. Does not this remind us of the occasional apparent sporting of diphtheria from scarlet fever? My friend Dr. Ransome, who has paid so much attention to the laws governing the spread of epidemics, relates the following instance:—A general outbreak of scarlet fever occurred at a large public school. One of the masters who took the infection exhibited diphtheritic patches on the throat. This patient was sent to his own home in Bowdon. Six days after his arrival, his mother was attacked, not with scarlet fever, but with diphtheria; though there were no cases of diphtheria at the time, neither at the school nor in Bowden. (*a*)

Take another illustration: cholera suddenly breaks out in some remote district in India, and spreads from that centre over half the globe. In three or four seasons the epidemic dies away and ceases altogether from among men. A few years later it reappears and spreads again, and disappears as before. Does not this look as if the cholera virus were an occasional sport from some Indian saprophyte, which by variation has acquired a parasitic habit, and, having run through countless generations, either dies out or reverts again to its original type? Similarly, typhoid fever might be explained as due to a variation from some common saprophyte of our stagnant pools or sewers, which, under certain conditions of its own surrounding, or certain conditions within the human body, acquires a parasitic habit. Having acquired this habit, it becomes a contagious virus, which is transmitted with its new habit through a certain number of generations; but finally, these conditions ceasing, it reverts again to its original non-parasitic type.

In regard to some contagia, such as small-pox and scarlet fever, it might be said that the variation was a very rare one, but also a very permanent one, with little or no tendency to reversion; while others, like erysipelas and typhoid fever, were frequent sports, with a more decided tendency to reversion to the original type. In regard to some pathogenic organisms, it might be assumed that the parent type had disappeared, and the parasitic variety only remained—just as the wild parents of many of our cultivated flowers and vegetables have disappeared, leaving beind them only their altered descendants.

How aptly, too, this view explains what used to be called the "Epidemic Constitution," and the hybrid forms and subvarieties of eruptive and other fevers.

I must not pursue this vein further. I have said enough to indicate that this conception enables us—if it does nothing else—to have coherent ideas about the origin and the spread of zymotic diseases.

In applying the doctrine of pathogenic organisms—or *pathophytes*, as they might be termed—to the explanation of the phenomena of infective diseases, we must be on our guard against hard-and-fast lines of interpretation. So far as our very limited knowledge now extends, the pathophytes hitherto discovered all belong to that group of the fungi which are called bacteria. Now, fungi have two marked characteristics, namely, the tendency to assume the parasitic habit, and the possession by some of them of a special ferment action. Both these characteristics may bear a part in the action of pathogenic organisms. In the complex phenomena of septicæmia such would appear to be the case—a poisonous ferment-product first intoxicates the system, and then the organisms themselves prey upon the dead or moribund tissues.

There is, as Dr. B. Sanderson has pointed out, a marked distinction to be drawn between those common processes of infective inflammation which are shared in by animals generally—such as septo-pyæmia, erysipelas, and the diphtheritic process—and those specific contagia which are strictly confined, like ordinary parasites, to particular species. There is nothing in all nature more wonderful than the intimate and subtle nexus which unites a parasite to its host. A hundred examples might be given. Even different varieties or races of the same species have different and exclusive parasites. It would seem as if this nexus depended on some delicate shade—*a nuance*—something like an odour, or a savour, or a colour, rather than on differences of structure or chemical composition. The same minute correlation is seen in specific contagia—all are strictly confined to one or a few species. Vaccinia is confined to man, the horse, and the cow; scarlet fever is confined to man, and perhaps the swine; most of our specific diseases are absolutely confined to man. The human and ovine small-pox, although so wonderfully similar, are not intercommunicable. I am, therefore, inclined to believe that, in regard to specific contagia, we shall find more guiding analogies in parasitism than in fermentation. Our information at present is, however, so defective that it is not wise to enter into further speculations on this subject.

Gentlemen, I have brought my task to a conclusion. I believe that the doctrine of a contagium vivum is established on a solid foundation; and that the principle it involves, if firmly grasped in capable hands, will prove a powerful instrument of future discoveries. And let no man doubt that such discoveries will lead to incalculable benefits to the human race: our business in life is to do battle with disease, and we may rest assured that the more we know of our enemy the more successfully we shall be able to combat him.

(*a*) Complex cases of mingled scarlet fever and diphtheria are sometimes seen. Similarly the peach-tree will occasionally, among a multitude of ordinary fruit, produce one fruit of which one-half has the peach character and the other half the nectarine character.—DARWIN.

SURGERY PAST AND PRESENT. (*a*)

BY T. SPENCER WELLS, F.R.C.S.E. F.K.Q.C.P.I.
Surgeon to the Household of Her Majesty the Queen.

THE author commenced his address by tracing the progress of the science from the Elizabethan age to the present time. He contended that the science of surgery had in the period mentioned advanced as much as any other art or science; great as those advances had been, and considering how the advance might be further carried on, he drew attention to the subject of anæsthesia and anæsthetics. He reminded his hearers of the anæsthetics at present in vogue, and remarked that in 1872 he made known his

(*a*) Abstract of an address deiivered in the Surgical Section at Manchester. August 9th 1877.

opinion that all the advantages of anæsthesia, with fewer drawbacks, could be obtained by the use of bichloride of methyline or chloromethyl than by any other known anæsthetic. It was the result of an experience of five years and of 350 serious operations. The experience of the five succeeding years, with more than 600 additional cases of ovariotomy, and many other cases of surgical operation, had fully confirmed him in that belief. Perhaps they were hardly aware how much the public expected from them in this matter. Deaths from chloroform were alarmingly frequent, yet no substitute for it had found universal or even general acceptance in this country; and he was not speaking too strongly if he said it was the duty of the Association at once, without any unnecessary delay, to satisfy the public that all that was possible was being done to discover the means by which anæsthesia, effectual now, might be rendered safe for the future. A certain section of the community, well meaning it might be, but led astray by thoughtless enthusiasts or self-interested itinerant lecturers, vehemently asserted that if medical men were to perfect themselves in these or in other modes of saving human life or lessening human suffering, they must only do so by practice upon the human subject; they must not, as a surgeon or a physiologist, take the life of a dog or a cat, a rabbit or a sheep, a pigeon or a frog, for any scientific purpose, or with the object of benefiting the human race. Anybody might slaughter oxen and sheep by thousands for human food in any way he pleased, oysters might be eaten alive—the pheasant or the partridge, the fox or the deer might be expressly reared to supply the sportsman with exercise or the amusement of killing; in a word, the lower animals might be devoted to the use of man for any purpose that was not scientific. But if a surgeon experimentally sacrificed half a dozen dogs or rabbits in the hope of improving some operation which might prevent the loss of human life or lessen human suffering, he was branded as inhuman, and barely escaped the supervision of the police. Possibly some of those benevolent individuals would voluntarily offer up themselves to the committee on transfusion, in the hope of perfecting the practice. Until they did so, they would perhaps be a little less clamorous if a few sheep or rabbits were used in the cause of humanity. With regard to splenotomy, pancreotomy, and nephrotomy, accident had proved that the spleen, or the pancreas, or a kidney might be lost without great injury to the human being. Surgeons had removed wounded pancreas and enlarged spleens, and a diseased kidney had been extirpated on two occasions at least, but the operative proceedings were still imperfect. Were surgeons to be allowed to excise the spleen or a kidney of a dog or a rat, or would zealous members of some anti-vivisection society enrol themselves as candidates for that immortality which was gained by anyone who immolated himself upon the altar of science? It would be false modesty if he were not to say boldly before the Association that he was proud of the share which British surgeons had had, and of the share which he himself had had in placing ovariotomy upon the roll of successful surgical operations. Great leaders among them, Simpson and Syme, Stromeyer and Billroth, Velpeau and Nélaton, had shown a generous appreciation of their work. And could they imagine a greater pleasure to a surgeon than to hear the president of the Medical and Chirurgical Society speak of his improvements in the operation of ovariotomy as "one of the greatest achievements of surgery in this century, and that the influence for good extended through every department of operative surgery?" While at the same society in 1850, Lawrence had asked whether this operation "can be encouraged and continued without danger to the character of the profession?" less than a quarter of a century after that denunciation Lord Selborne publicly stated the result of a calculation, that by his (Mr. Wells's) first 500 operations he had added something like 10,000 years to the lives of European women.

What number of operations had been done by other surgeons he knew not, but supposing that the same probability of the duration of life applied to the women who have recovered from operations he had done since the results of his 500 cases were published in 1872, the gain would be about 18,000 years, and this by one surgeon alone, and by an operation which only thirty years ago was denounced as so fearful "in its nature, often so immediately fatal in its results," that, whenever performed, "a fundamental principle of medical morality is outraged." When German princes practise surgery, and a brother of an English Earl, a Cabinet Minister, was met with as a practising physician, they might think less of the admission of members of their profession into royal and noble families, and look with more hope for recognition by the Government of services rendered by medicine and surgery to the nation. They would not then have to notice anything so disheartening to a learned profession as the fact, that while for the affair of Magdala Lord Napier was honoured by a title and rewarded with a pension, the extended average duration of life of the whole population, and its actual increase, due to sanitary and medical science, and far exceeding in importance the annexation of a province, or even of a kingdom, had earned for Simon the barren right, shared by many less honourably known men, of putting the magic letters C.B. after his name, and William Farr still remained without any mark of national gratitude. Why should a baronetcy be the highest titular distinction conferred upon members of their profession? Was Jenner or Paget less worthy of a life-peerage than anyone of the eminent men who now sit on the bench of bishops—or any of the lawyers, soldiers, or sailors who had been rewarded by hereditary peerage? None of their leaders had time for electioneering or the turmoil of party struggles in the House of Commons; whereas many of them were well fitted for the more dignified position, and would be quite able to devote their time and energy to sanitary legislation in the Senate.

If, in the 40 years since the Association was founded, the great progress which he had so hastily and imperfectly endeavoured to review had been made, what might they not augur for it in years to come? The Association had its early struggles, and had passed through them. The history of the past and the study of the present, alike helped them to look forward with hope and trust to the future. He further urged the importance, or rather the absolute necessity, that the surgeons of the future must be educated gentlemen; that schemes of education should be so ordered as to bring into the profession, as far as possible young men who had had the advantage of the highest general culture to be obtained by any English education. Until this was secured the flower of the University youth would still choose the church or the bar, the army or the navy, or some branch of the Civil Service of the State, where they at once took an enviable social position as members of an honourable profession, and where a successful career might lead to a seat in the House of Lords, to the pensions and tithes freely granted to the fortunate soldier or sailor, and more sparingly, to the meritorious Civil servant of the Crown. It was rather surprising that without any of those inducements, and in spite of the taint of trade forced upon the profession by the powers of the Apothecaries' Company, and its continued alliance with their colleges and universities, they still had abundant evidence of a rapid rise of the profession in the social scale.

NOTE ON TINNITUS AURIUM.

By Lennox Browne, F.R.C.S., Edin.
Senior-Surgeon, Central London Throat and Ear Hospital.

My friend, Mr. Douglas Hemming, has very concisely pointed out (in your issue for August 1st) some of the principal local causes of which singing in the ears is a prominent, distressing, and obstinate symptom, and he has accurately noted the indications for relief of the various local lesions, as he has witnessed them in hospital practice. It is important to point out that this same

condition often occurs without any distinct local indication, and as a result of general systemic disorder or of a particular diathesis. The following cases, which at once occur to me, are taken from notes of my private practice, in which naturally the exact history of symptoms are often more carefully noted than in hospital out-patient work :—

Case I.—A lady, æt. 46, consulted me on the 26th ult. on account of distressing and perpetual noises in the ear, as of "the sea roaring on the beach." Hearing power was almost normal, a 60-inch watch being heard at over fifty inches. The patient is principal of a very large governess training college, and finds that her complaint is always aggravated by her duties, is relieved by food and by complete rest; but she shrewdly states that in her vacations the noises are almost as bad or worse, since visiting friends, amusements, &c., are more provocative of her symptoms than her routine work. The tinnitus (which is probably due to brain exhaustion) first commenced after a severe attack of menorrhagia, producing general anæmia and great prostration.

Case II.—A barrister, æt. 36, consulted me on Dec. 29th, 1876, on account of some impairment of hearing (increased if in a railway carriage or noise) and tinnitus. W. P. $\frac{18}{60}$ not much increased by Politzer inflation. Inhalations forced through the Eustachian tubes by the Valsalva method appeared to do more harm than good, and in fact no change took place, until I found that the patient was in the habit of sitting up working very late at night and of smoking to excess. Abstinence from tobacco at once relieved the noises, which recurred if the habit was resumed.

Case III. is that of an Indian merchant, æt. 35, some time resident in Singapore, first seen by me June 14th last, by recommendation of Dr. De Gorrequer Griffith. It was not possible to do more than relieve impaired hearing power in the left ear of this patient by inflation, &c., until his tobacco was reduced in quantity. With him Manilla cigars and Cavendish tobacco invariably produce tremors, and I was always able in this case, by the appearance of the fauces, to accuse him, without fear of contradiction, of an excess.

Case IV.—A young lady, æt. 17, was sent to me by Dr. Dabbs, of Newport, Isle of Wight, July 2nd, suffering from deafness and tinnitus, of sea-shell character, in left ear. W. P., right ear, $\frac{10}{60}$; left ear on contact only. The tonsils were enlarged, and their removal, followed by Politzer inflation, greatly improved the hearing. The tinnitus was only removed by extraction of an upper and lower molar tooth, each very decayed.

Case V.—A single lady, æt. 50, sent to me by Mr. Samuel Cowan, of Bath, on June 5th last, in whom tinnitus of the pulsating character, with deafness of the left side, were caused by a nasal polypus, removal of which has been attended by thorough relief of the aural symptoms.

In addition to the foregoing—which, as may be observed from the dates, are taken as just fresh in my recollection—cases of tinnitus constantly occur as the result of a gouto-rheumatic disposition, in which the hearing may not be much impaired, but in which there is not unfrequently a more or less eczematous condition of the external auditory passages; and there are also many cases due to simple dyspepsia. I have occasionally seen cases in which the symptoms were due to renal disease. And, lastly, progressive deafness with tinnitus often originates with child-bearing, each succeeding pregnancy making the condition worse in degree and in obstinacy against treatment.

In the United Kingdom the births of 293,855 children, and the deaths of 176,585 persons of both sexes, were registered in the three months ending 30th June, 1877. The recorded natural increase of popoulation was thus 117,270.

ABSTRACT OF CLINICAL LECTURES ON SYPHILIS.

By S. Messenger Bradley, F.R.C.S.,

Surgeon to the Manchester Royal Infirmary, and Lecturer on Practical Surgery, Owens College.

Lecture VI.—*Treatment of acquired Syphilis in Secondary and Tertiary Periods—Various Methods of Treatment by Mercury—Subcutaneous Injection—Mercurial Fumigation—Inunction—Internal Administration of Mercury—Syphilisation—Use of Iodide of Potassium—Objection to any one Universal Plan—Treatment of Hereditary Syphilis.*

Having discussed the treatment of the local lesions of syphilis, we may to-day proceed to speak of the secondary and tertiary periods of the disease. It is, perhaps, too much to say that mercury is a true antidote in the sense that so much syphilis can be counteracted and neutralised by so much mercury; but, nevertheless, mercury does exercise an astonishing influence, and it is to mercury that we have chiefly to trust in our treatment of the disease. During the later stages of secondary affections, and throughout the whole of the tertiary period, iodide of potassium becomes indispensable, sometimes combined with mercury, at other times alone—indeed, the value of the two drugs alternates; as the power of the mercury falls that of the iodide rises, until the latter becomes almost alone beneficial. There are many different plans of administering these drugs, particularly mercury, but all have the same object in view. Our endeavour is to bring the patient quietly under the influence of mercury, just reaching a point of gum tenderness, never proceeding to absolute salivation, and there keeping him for a period of from four to six months. The gums may then be allowed to regain their firm condition of perfect health, when the mercury should be recommenced and continued for another six or eight months. In all cases of constitutional syphilis the mercurial treatment should extend over a twelvemonth, and in no case should treatment of this kind be desisted from until there has been complete immunity from all specific symptoms for a period of six months. When acute symptoms of a serious nature arise, such as iritis, then we should advance more boldly, and by vigorous action bring the system under the influence of mercury as speedily as possible. All the modes of treatment, then, aim at this for their end, and each requires a few words of explanation.

Inunction.—The treatment by inunction consists in rubbing a drachm of strong mercurial ointment thoroughly well into the skin, once each day, until the desired effect is produced, when the mercurial action may be maintained by a less frequent application of the unguent. This is essentially the treatment practised at Aix-la-Chapelle, which has attained such notoriety, for the sulphur baths and the other adjuvants are of little importance. The rubbers employed at Aix take a different portion of the skin each day, so as not to over-irritate any particular surface; thus, they first select the right leg, next day the right thigh, third day the left leg, fourth the left thigh, fifth the right side, sixth the left side, seventh the right arm, eighth the left arm, and on the ninth day of rubbing they return to the right leg. This most excellent plan may be carried out in England either by the patient himself, or by making special arrangements with the shampooer at a Turkish bath. There are two modifications of this plan of inunction, viz., the mercurial belt and the use of dry calomel. The belt consists of two folds of flannel, 1¼ yards long and ¼ yard broad, on the front of which a quarter of an ounce of mercury is smeared every morning and worn during the day next to the skin. This method is necessarily less speedy and active than inunction, but answers exceedingly well in keeping up the desired action short of salivation. If the use of dry calomel be determined upon the patient should be instructed to dust the heel of each stocking with five grains of calomel every morning, so that

some of the drug may be absorbed during the day's exercise.

Mercurial Fumigation consists in treating syphilis by the mercurial bath. This bath is a small tin construction, procurable at any instrument-makers, having a little plate for the calomel at the top, surrounded by a fosse, in which is placed the water; heat is applied by means of a spirit lamp, situated beneath the trough and the plate. The water boiling produces moist heat, which opens the pores of the skin, and the calomel being first volatilised, and then falling in powder upon the surface of the body, is readily absorbed. The bath should be kept alight for twenty minutes, and then blown out, the patient sitting and cooling for another ten minutes, after which he should, if possible, at once retire to bed. If properly arranged, the whole of the powder, consisting of half a drachm of calomel, is sublimated in the process. The baths may often be continued nightly for five or six months without producing salivation.

Subcutaneous Injection.—Either mercuric-chloride or cyanide of mercury may be administered subcutaneously in doses ranging from the one-thirtieth to the one-fifteenth of a grain. The skin of the arms or buttock may be selected, and the injections repeated two or three times a week as long as is found necessary.

Internal Administration.—It often happens that this is the plan resorted to. Almost any of the preparations of mercury are occasionally selected for the purpose, but the protoiodide and the chloride, the sub-chloride, or crude mercury, in the form of blue-pill, are the preparations most frequently chosen. One of the most active forms is the iodide; one of the least irritating (in my experience), is the sub-chloride, when given in combination with sulphurated antimony, as is the case when we prescribe Plummer's pill. I append in the form of a footnote a list of particular prescriptions containing mercury, each of which has been highly lauded by certain practitioners (*a*). Whatever preparation be fixed upon, it should be continued until the gums are rather soft and sore, and then given in smaller and less frequent doses, to prevent this condition either entirely passing away or proceeding to absolute salvation.

Syphilisation.—It is necessary you should understand what is meant by this term, though by no means necessary, or even desirable that you should ever practise it. The matter for the inoculation is taken from a soft chancre or a chancrous erosion, and introduced into the circulation of the patient through three punctures upon the side: here the inoculation is repeated every third day so long as any effect is produced; then a fresh site is chosen, the arm for example, and so on until the whole body is syphilis proof. This method, which never obtained a secure foothold in England, is fast falling into a deserved desuetude in those countries where it once enjoyed a false and ephemeral reputation. A variety of this plan, equally condemnable, is termed "revulsion," and consists in producing a pustular eruption by inoculating with tartar emetic.

Such very simply are the different methods of treating constitutional syphilis, and, with the exception of the last, each plan has certain advantages which in certain instances renders it the best method to adopt; before, however, summarising these plans I must say a few words as to the use of iodide of potassium in the treatment of syphilis. Quite inoperative during the period of the primary lesion, iodide of potassium, begins to exercise control over the manifestations of syphilis as soon as it enters upon the period of general eruption, and from this date its value constantly rises as a therapeutic agent until the termination of the disease. Under its exhibition the red corpuscles of the blood are increased, and syphilitic exudations melted away: it exercises a special control over affections of the white fibrous tissues, and may be counted on with confidence to remove for the time being most of the later lesions of syphilis. It cannot, however, be regarded as a substitute for mercury, as it does not seem to do much more than remove the manifestations of syphilis during the time of its administration; mercury is almost entitled to be called an antidote to the syphilitic poison: iodide of potassium cannot be said to be more than a valuable remedial agent; in a word, mercury cures syphilis, iodide of potassium only removes the present symptoms.

The dose for an adult varies, five grains may be given to begin with, and if this fail to exercise the desired effect it may be increased by two-and-a-half, or five grains, at a time, until as much as half a drachm is given three times a day. Beyond this dose it is useless to push the remedy; iodism will probably be induced, but no other result can be looked for.

I am not one of those who hold that the *rôle* of mercury is played out with the end of the second chapter of syphilis, but on the other hand regard it as *the* agent to employ throughout the period of gummy exudation, for given in small doses mercury acts as a tonic, and may be safely prescribed in the most weakly subjects; indeed, when judiciously handled, it is common enough to find the appetite improve, the weight increase, and the general look of health return. Let us turn for a moment to consider the disadvantages which, from time to time, attend the administration of mercury according to any particular fixed plan.

The objection to giving mercury by the mouth is the very sufficient one that some stomachs will not tolerate the internal administration of mercury in any form; indeed, it is a matter of experience that in some constitutions it not only purges, but acts as a veritable poison. (*a*)

The objection to inunction as a universal remedy (besides its essential dirtiness and the necessary exposure it involves) lies in the fact that the skin of some patients is so irritable that the inunction produces an intolerable rash.

(*a*) *Sedillot's Pill*—
℞ Strong mercurial ointment, gr. 1·5;
Medicinal soap, } ā gr. 1·5.
Powdered marsh mallow, }
For one pill.

Van Swieten's Drops—
℞ Bichloride of mercury, 12 parts;
Corn spirit, 1000.
A tablespoonful night and morning.

New Form—
℞ Bichloride of mercury, 1 part;
Distilled water, 900 parts;
Rectified alcohol, 100 parts.

Cullerier's Pills—
℞ Bichloride of mercury, 1 part;
Wheat flour, 15 parts.
Powdered gum, 2 parts;
Distilled water, 9·0, at first warm.
Two-and-quarter grs. to be taken night and morning.

Dupuytren's Pills—
℞ Bichloride of mercury, gr. 0·18;
Extract of opium, gr. 0·22;
Extract of guiacum, gr. 0·75 parts.
For one pill. One night and morning.

Larrey's Syrup for Children—
℞ Simple syrup, 500 parts;
Muriate of ammonia, }
Bichloride of mercury, } āā ·30 parts.
Extract of opium, }
One to six tablespoonfuls daily.

Ricord's Pills—
℞ Proto-iodide of mercury, }
Extract of lettuce, } ā 45 grs.;
Extract of opium, 15 grs.;
Confection of roses, 90 grs.
For 60 pills. One three or four times a day.

(*a*) The homœopaths employ a preparation of mercury, which is very free from irritating properties, and which is often extremely useful in treating syphilis. They call it Mercurius dulcis 1; it is composed of calomel one part, and sugar of milk ninety-nine parts. Ten grains of this preparation (*i.e.*, equal to one-tenth of a grain of cal.) will generally purge an adult; five grains three times a day will cause any syphilid to speedily disappear without imperilling the health.

It is true that a continuance of the treatment will sometimes cause this to subside, but it is not always true, and in these cases it must perforce be given up. Both the plan of inunction and its modifications, the mercurial belt, and wearing calomel in the heel of the stockings, are open to the same objections, inasmuch as they are both uncertain, sometimes quite failing to produce any result at all owing to some local error in the absorbent system, and at other times operating with undesirable swiftness and vigour on account of some abnormal activity in the lymphatic and capillary vessels.

Then there are objections to the mercurial vapour bath, though neither numerous nor grave ones, but sufficient to prevent us considering it in the light of a universal remedy. It is found that in some constitutions it produces profuse sweating, and, as a consequence, seriously debilitates. For these reasons the bath is generally found to be an intolerable mode of treating syphilis in hot climates. Again, the general abolition of the morning tub renders it a very unpleasant method to some patients.

The subcutaneous treatment will probably never be largely adopted; it entails the constant attendance or supervision of the surgeon, and besides this the repeated prickings are not unlikely to produce subcutaneous abscesses. It has, however, proved fairly successful in the hands of those who have tried it, and does not appear to have caused abscesses as often as we should *à priori* have expected.

Again, not only are there occasional objections to each plan of giving mercury, but some subjects cannot safely be treated with mercury according to *any* plan. It is impossible to lay down any precise description of those subjects who may not with propriety have mercury at all, but nevertheless such subjects exist. It is not correct to say that scrofula, or age (whether extreme youth or extreme old age), or debility, or any definable cause, forbids its uses; for though in the cases I have mentioned it requires great caution, yet such a preparation as the homœopathic combination of calomel and sugar of milk may nearly always be safely given. It is satisfactory to know that those patients who are forbidden the use of mercury are not thereby necessarily injured for all future time; for syphilis, like all other specific fevers, runs a definite course, and tends in course of time to become naturally eliminated, when the system becomes open to a fresh attack. We can no more lay down precise rules for the *quantity* of mercury or the length of time it has to be given than we can for the mode of giving it. We must be guided solely by the effect produced. We certainly can judge from the first syphilid whether the treatment by mercury is likely to be a long one or not, the mild syphilid, such as roseola, indicating a speedy elimination of the poison; the more virulent eruption, such as rupia, pointing to greater resistance, and hence to a more lengthened period of treatment. (*a*) In giving alcohol we know if the pulse becomes fuller and less frequent, the tongue moister, and the delirium less, that the stimulant is doing good; and in the same way we know that if while taking mercury the patient gains flesh and strength the drug is being administered with benefit.

Whatever treatment is adopted, it is of the first importance to maintain the general health; syphilis hits a man when he is down, and we must endeavour to keep him up to prevent such a catastrophe. *Apropos* of this, the advice of Ricord is worth remembering. "En un mot, l'accident le plus saillant, l'épiphénomène quel qu'il soit, est celui qu'il faut combattre, sans negliger aucun des élémens qui peuvent fournir des indications thérapeutiques."

(*a*) "The first syphilid is the most valuable sign to rely upon. In fact, the greater or less intensity of the prodromata show only the greater or less power of resistance in the constitution of the subject of them. With a roseola pure and simple, continuing as such during the whole of its duration, not showing any disposition to become papular, and becoming effaced in ten or fifteen days, much is to be hoped, spontaneous cure is almost certain. But the contrary is not less true; vesicular and pustular syphilides always carry with them, of course, an unfavourable prognosis."—Diday, "Histoire Naturelle de la Syph.," p. 119.

It is altogether beyond the scope of these lecture to go further into details of treatment, but I may conveniently recapitulate a few essential points. In regard to the initial lesion, local treatment will generally suffice to heal it; but should it not, mercury, either by the mouth or skin, will nearly always ensure cicatrisation. Even with phagedænic chancres, a mild mercurial course, especially by inunction, is sometimes necessary, though a change of air will often cure such an ulcer better than anything else. Phagedæna and phymosis are indeed the most troublesome complications of the first stage. In cases of phagedæna the best plan is to chloroform the patient, and then, by means of the gas cautery, to thoroughly destroy the *edges* of the sore; dressing with black wash or dry calomel, combined with change of air, will always effect a cure after this is once efficiently done. The occurrence of phymosis is also a troublesome complication, and requires prompt treatment. I remember in the summer of 1864, the boatswain of the Cunard steamer *Asia* sending for me during the homeward voyage in a case of this kind. He had only noticed that something was wrong the day before, and yet when I saw him the phymosis was so extreme as to render exposure of the glans impossible; as I thought I could detect an ulcer beneath the swollen foreskin, I slit up the prepuce freely and found that almost all the glans had sloughed away. Further destruction was, however, arrested by the application of strong nitric acid, and by the time we reached Liverpool, cicatrisation was going on very favourably.

In conclusion, I would say that though the treatment of syphilis can be summed up in very few words,—that although the whole principles might be epitomised thus—for the initial lesion, destruction with some powerful caustic, such as Ricord's carbo-sulphuric paste, or strong nitric acid, then healing with black wash or other suitable lotion,—for the early stage of secondaries a mercurial course, so as slightly to affect the gums, which should be kept a little tender for from four to six months,—for the late secondaries the combined use of mercury and iodide of potassium, (*a*)—and for the tertiary affections minute doses of mercury, iodide of potassium, cod-liver oil, iron, sea air, and sarsaparilla, the best possible health being maintained throughout by careful hygiene and strict *moderation*—still, though it is true that the treatment can be thus briefly summarised, it is none the less true that no disease demands more skill in diagnosis, or more judgment and care in treatment, than hydra-headed syphilis.

Treatment of Hereditary Syphilis.—It remains for me to say a few words upon this head. The career of hereditary syphilis is beneficially influenced by the use of anti-syphilitics administered to the mother during the period of gestation, and if the mother persists in suckling her child, this method of treatment should be steadily persevered with during lactation. In addition to this it is at the same time necessary to treat the little patient more directly, and with this end in view we should get to work as soon as possible. If a child's skin would stand it there is no doubt that mercurial inunction, or wearing a mercurial belt, would always be preferable to the internal administration of the drug. Unfortunately, however, it often happens that persistence in the external employment of mercury produces an intolerable rash, which compels us to abandon it. In such a case a grain of hydrargyrum cum cretâ may be prescribed to an infant a month old, night and morning, and continued as long as the symptoms last—this quantity may be cautiously increased, grain by grain, as the child grows older. When the milk teeth are cut the mercury may be accompanied by a teaspoonful of Parrish's food, or a teaspoonful of the syrup of the iodide of iron. It is desirable to anticipate fresh explosions of the poison by periodical dosings of this character, especially is this necessary at such epochs as the first and second dentition, and at the age of puberty. If confidently and persistently attacked it

(*a*) It is well known that ammonia materially increases the good action of iodide of potassium; it is for this that the French are in the habit of so frequently giving iodide of ammonia.

is astonishing how hereditary syphilis will yield, symptoms may burst out again, from time to time, but if vigorously and promptly met they will rarely fail to be beaten back, and eventually they will be completely routed and conquered, and the system finally freed from the ravages of the poison.

WEDNESDAY, AUGUST 15, 1877.

THE BRITISH MEDICAL ASSOCIATION.

THE annual meeting of the British Medical Association is one of those events in which the whole profession must feel more or less interested. If, as our special correspondent well remarks, the Association had only been designed for pleasure—for *soirées*, receptions, dinners, excursions—it would deserve support, for the average general practitioner has but few opportunities of indulging in such relaxations. It has, however, other claims upon the attention of the profession, and the immense gathering that has just taken place at Manchester, and the brilliant success of the meeting altogether, show that these claims have not been lost sight of. The number and character of the addresses that have been read on this occasion testify to the scientific spirit of the Association, while the respect in which it is held by the *élite* of the profession is shown by the eminence of the physicians and surgeons by whom those addresses were delivered. At the same time it may be as well to remember that the conduct of the Association has not been free from many sins of omission, and that the work they have done has not been so conspicuous for the impetus they have given to the advancement of medicine and of the social interests of the profession, as for the good feeling they seek to promote among all ranks of medical men. However admirable the addresses and papers may be, it should be borne in mind that they are not the product of the proper work of the Association. They are the result of the individual and independent labour and thought of certain of its members, and might have been composed, written, and published had the Association never existed. But quite a different view must be taken of the plan of scientific grants that has been adopted, and if the Association is to increase its sphere of usefulness from a scientific point of view, it must be by increasing the number and value of these grants, as well as by encouraging that system of co-operation amongst its members upon which truthful observation and the advancement of medicine so much depend. And as respects the social status of the profession, it is to be hoped that the Association will take a more active interest in everything that affects the social condition, the dignity, and education of the profession; that it will do more than it has hitherto done to check quackery, imposture, and all illegal practices; that it will set its face against all such professional behaviour and modes of practice as tend to lower the profession in the estimation of the public, and will take care that none of its members are guilty of any other conduct than that which deserves its approval.

OUR BANK HOLIDAYS.

OUR Bank Holidays have already become such an institution amongst us, and are so appreciated by the great mass of the community, that few will venture to say a word in their disparagement. Nor is it difficult to account for their popularity. They afford the opportunity of rest or recreation to thousands of hardworking people, who before they were established, were in nine cases out of ten, confined to work, or who, at the most, had but a few days' holiday, throughout the year. To the poor clerk who toils at his monotonous task from nine in the morning to seven or eight at night; to the still more unfortunate shop-girl, who is kept standing behind the counter of a crowded shop for nine or ten hours every day; to the seamstress, the artisan, and many others we might mention, it is no small boon to be able now and then to exchange the air of the close and ill-ventilated office or workroom for the fresh breezes of the coast or the balmy zephyrs of the country.

There can be no doubt that a week or ten days' holiday is not sufficient for those who have, without any intermission, been congregated at work all the rest of the year. And this is the case, whether we look at it from a hygienic, a social, or commercial point of view. Both body and mind have been too much jaded by the uninterrupted labour to respond to the otherwise salutary influences of change of air and scene; life and society are alike spoiled and degraded by this continued drudgery; and even the employer finds that unremitting work is not synonymous with greater despatch of business or increase of profits.

Nevertheless, we feel it our duty to remind the public that, in some respects, their bank holiday cannot be regarded with unmixed feelings of satisfaction, and that the noble object which Sir John Lubbock had in view in establishing it can, under present arrangements, only be attained at the expense of several evils, which cannot be disregarded by those who take an impartial view of the

effects of this holiday upon the health and morals of the working classes.

It is not, however, our intention to join in some of the ill-natured remarks that have been made upon the subject. It would, for instance, be rather captious to say that the temperance movement is not likely to find an ally in the people's holiday, as a little uproarious mirth is excusable on such occasions, and, considering the multitude let loose upon her Majesty's highways and byways, it would be strange if a few were not found to abuse the advantages offered to them. Our concern is more with circumstances that are inseparably connected with the scope of the Bank Holiday. This is of such magnitude as to make the term "bank holiday" quite a misnomer. Bankers' clerks constitute but a small percentage of the great mass of people who take advantage of the occasion. The denizens of all great towns are invited, and in a manner compelled, to shut up their shops and give themselves an airing. There is an exodus of the population, as thorough as if the town was going to be sacked, or a great plague had broken out and was decimating the inhabitants. But the most remarkable feature of this British carnival is the fact that for the most part this sudden and simultaneous emigration is only for the day. At night you will see them all flocking home—train after train, penned in like so many sheep, with scarcely any room to breathe, and, if nothing worse, somewhat exhausted from their day's outing.

It may, however, be doubted whether this is the best way of recruiting the health and strength of the hard-worked citizens of this great city. It is all very well for people to go to church, or to war, *en masse*, but we are not so sure it is good for them to take their pleasure *en masse*. This remark applies especially to the population of London. We are informed that no fewer than 13,840 persons visited the Brighton Aquarium last Bank holiday. At Margate, so great was the influx of visitors that many could not obtain sleeping accommodation. The steam-boats alone brought down 5,000, and the frequent trains were heavily laden. The hygienic surroundings of those holiday folks can be more easily imagined than described. Re-breathed air, the exhalations inseparable from a crowd in the month of August, drinking and smoking, the fatigue incidental to sight-seeing and tedious journeys by rail—all these must be a heavy discount upon the salutary effect otherwise experienced by the excursionist. At all events, these contingencies should be taken into consideration by those who are inclined to overrate the boon which the philanthropy of Sir John Lubbock has conferred upon the working classes. There are few who would not admit that the countless *employés* at work in this metropolis are in need of more relaxation of mind and body than that within their reach, but it would, perhaps, be more to their advantage if they could take their holiday piecemeal, instead of the wholesale manner at present practised. There are few great firms and few tradesmen who could not, two or three times a year, allow their clerks or workpeople a day's holiday, and even find (as was found after the passing of the Factory Acts) that their assistants did, in the long run, all the more work in return for their little more play.

From a sanitary point of view, these class or denominational holidays would be preferable to those of which we have been speaking. John Brown would certainly find his health and comfort all the better cared for, if he could run down to the sea in a train that was not crowded to suffocation, or in a boat where there was room to move; while the grocer and his wife would, in their little way, find the trip all the more enjoyable if, on their arrival at their watering-place, they could really see the "lions," instead of a mass of hats and bonnets, or sleep in a decent bedroom, in place of a garret.

No doubt the great advantage of the bank holiday is that it is a compulsory one. Nothing is left to the caprice or generosity of the employer. Whether he be a greedy and selfish man, or a liberal man, it is all the same to his clerk. The law has set him at liberty, and out he flies with as much joy as a caged bird. But, to pursue the metaphor a little further, were the flock, of which he is but a small unit, only less numerous than it is on these occasions, it would, in our opinion, be better for the flock, as well as for those who come in its way.

Here we must bring our remarks to a close. What we have said is not in any cynical spirit. We yield to no one in our admiration for any movement that is intended to encourage the healthful recreation of the working classes; but we would wish that the means resorted to for this purpose are not such as to run the risk of partly defeating the very object which our philanthropists have in view.

THE IRISH PUBLIC HEALTH BILL.

THE future of sanitation in Ireland has been in the balance within the last fortnight, the Public Health Bill having been before the Select Committee of the House of Commons, who have just completed their sittings and agreed to their report. The Bill was in Committee of the whole House last week, but having been vigorously opposed by the Obstructionists, though supported by Mr. Meldon, it had to be withdrawn.

We are gratified to be able to state that active opposition on the part of the profession is no longer necessary, inasmuch as all the points urged upon the Government on their behalf have been conceded. These points were four in number:—

(*a.*) That the medical sanitary officers should, with a view of improving their status, be called "medical officers of health."

(*b.*) That the restriction as to sanitary salaries, imposed upon boards of guardians by the Local Government Board, should be withdrawn, and that henceforth the Guardians should be at liberty to grant any salary they think fit, proportionate to size and nature of district, and subject to the approval of the Local Government Board.

(*c.*) That the medical officer should be remunerated for his testimony at sanitary prosecutions.

(*d.*) That a fair fee should be allowed for services on board ship.

These are the points which especially affect the medical officers, and they have been yielded by the Government in consequence of the energetic action of the Irish Medical Association and the representations made by Dr. Grimshaw (Chairman of Council), Dr. Speedy, and Dr. Jacob

on their behalf. The concession of these points is a decided gain to the sanitary officers, and the Association deserves every credit for its successful efforts, without which all the abuses and injustices of the existing system would undoubtedly have been perpetuated; but there remains behind another matter, without which the profession cannot rest satisfied, and without which the sanitary organisation of Ireland will continue to be little better than a sham. That it *is* a sham, nine-tenths of our Irish readers can testify, and they will unhesitatingly endorse our statement that it is so, and must continue to be so, simply because there is no supervisory establishment at head-quarters; because the onus of all sanitary proceedings is cast upon the medical officer; and because the Irish Local Government Board has no means whatever of knowing whether any individual sanitary authority or any officer does his duty or neglects it.

How could the law be supposed to produce any good result under such circumstances? It provides admirable facilities for effecting sanitary reforms—drainage—disinfection—nuisance removal—safe burial—baths—water supply—all are carefully and minutely provided for. But then this elaborate legal code is placed in the hands of the small farmers and petty shopkeepers, the very men who avow their contempt for sanitation and their dislike to interference with the dirt proprietors of their locality; and the only person who is charged with the duty of putting the law in motion is the dispensary doctor, who—in most instances—dare not, at the peril of his professional ruin, move an inch against the will of his board. Let us suppose that a more enthusiastic than prudent officer, in spite of being discouraged and unpaid, enters upon a conscientious crusade against dung-hills and typhoid factories; his energy is perfectly useless, for his Board of Guardians serenely ignores all his reports, and maintains a masterly inactivity which effectually cools the ardour of the reforming doctor, until he acquires the wisdom of taking his salary and doing nothing for it. Meanwhile the Irish Local Government Board exists in complete ignorance as to whether that particular locality needs sanitation, whether the sanitary authority is disposed to work the law, whether the medical officer is competent or willing to do his duty, and whether the attempts which he does make are crowned with success.

In this blissful state sleeps the Local Government Board, because—as it has itself stated in its official report—it has no inspector available specially for sanitary supervision; and thus the farce of public health reform is played out from week to week, a useless burthen upon the taxpayers, and an opprobrium to the Government which permits such a state of things to exist.

That the authorities are alive to the importance of supervision of Boards and officers is evident from the fact that such overlooking is fully provided for in England, and is constantly availed of to bring lethargic boards and officers to book; and we, therefore, fail to acknowledge a good reason why the same mainspring of sanitary reform should be refused to the Irish system. It is so refused, no doubt, because it would charge the Consolidated Fund with four or five salaries of £500 or £600 each; but we can hardly conceive it possible that the Irish Government will lend itself to the perpetuation of a system which it must know to be discreditable and inefficient.

We earnestly appeal to Sir Michael Beach and Mr. Gibson to remedy this blot upon the measure before it is again introduced. It matters little from what source inspectors should be paid, but they should be provided at any cost, or the Act repealed until the time comes when it can be honestly worked.

It has been hinted that the necesity for supervision had been urged upon the Government as a means of making places for the doctors. Is such a sneer worthy? Has the attitude of the profession towards Irish sanitation been self-interested or grasping? Have not the medical sanitary officers given a most earnest and hearty co-operation to every attempt at improvement of the public health, against their own interests, and in spite of their miserable remuneration? Does anyone believe that half-a-dozen berths, of the value of £600 a year each, is a bribe capable of influencing the profession at large? The suggestion deserves not argument, but contempt.

We look to the independent members of the House to insist upon the incorporation in the Bill of the arrangements essential to make it work, and we shall deeply regret if Ireland be left dependent for its sanitary improvement upon the ludicrously ineffective system which now exists.

Notes on Current Topics.

The Anti-Tobacconists in Paris.

It will be remembered that some months ago we drew attention to the interest which this subject was attracting in France. A society of anti-tobacconists, recently established in Paris, propose to bestow a number of premiums, varying in amount from 100 to 300 francs, together with medals of honour—first, for the best essay addressed to the young on the dangers of the premature use of tobacco; next, for the most extensive collection of interesting and hitherto unpublished remarks, to be drawn up by a medical man, on the diseases directly or indirectly caused by smoking; and finally, for the best essay on the moral and physical influence of tobacco on civilians and soldiers, and on students in public and private schools. The *Daily Telegraph* has, in a long leading article, drawn attention to the same subject, and it is gratifying to find that this popular journal takes a very sensible view of the question, equally removed from prejudice and partiality, and one which will be readily endorsed by the medical profession, for most practitioners will allow that smoking is not prejudicial to the health if practised in moderation, and provided the habit is not indulged in at too early an age. Under some circumstances it seems almost a necessity of life, and an army, on entering upon a campaign, would no more think of going without their tobacco than without their food—would, indeed, much rather go short of the latter than of the former. It is, however, the duty of every medical man to impress upon his patients the necessity of either smoking in moderation, or of abandoning the practice altogether. Such agents as the lay press and the anti-

tobacco societies may do much to restrain this habit within such bounds as prudence and science dictate, but after all it is the medical profession which can exercise the most control over the smoking propensities of mankind, and we shall be wanting in our duty if we evade the responsibility which our professional opportunities impose upon us.

The Health of the Russian Army.

It is certainly singular, remarks the *Standard*, remembering past experiences of war in Bulgaria and the anticipations which previous to the commencement of the campaign were indulged in with reference to the effects of climate upon the invaders, that we have as yet heard very little about sickness in the Russian army. Hitherto, however, all has gone well; and the health of soldiers depends very greatly upon their *morale*. Victorious troops suffer far less from disease than do defeated ones, advancing troops less than those who remain halted. Hitherto the Russian troops have been advancing, and regarded themselves as victorious. The conditions are now changed, and we are mistaken if in the next fortnight we shall not hear far more than we have hitherto done of sickness in the Russian army.

Our contemporary is quite right in what he says with respect to the effects of victory and success upon the health of troops, but there are several other factors which will probably ere long influence the sanitary state of the Russian army, should their present campaign turn out a long and disastrous one. The health of an army in actual service depends also a good deal upon their food and clothing as well as upon the weather they encounter, and it is just towards the end of an unsuccessful campaign that any misfortune in these respects is most likely to occur, and tells with most effect upon the health of the troops. Great heat during the day, followed by cold, chilly nights; great humidity of the soil or a large amount of rainfall; feet almost naked for want of shoe leather; and lack of provisions—these are some of the conditions which, operating upon an army dispirited by defeat, soon decimate them with fever, diarrhœa, and dysentery, and may thin the ranks of the Russian host.

The Geneva Medical Congress.

The following are the subjects which have been appointed for discussion in each section, with the name of the person who is to open the debate :—

Medicine.—1. Ulceration of Stomach, Professor Lebert. 2. Parasitic Affections of Skin, M. Hardy, Professor of Clinical Medicine at Paris. 3. Etiology of Typhoid, Professor Bouchard. 4. Treatment of Fever by Baths, M. de Cevenville, of Lausanne. 5. The Existence of Tissues Implanted in the Organism, M. Zahn, Professor of Pathology at Geneva. 6. Tracheotomy and Croup, M. Revillod, of Geneva. 7. A Universal Pharmacopœia, Professor Gille, of Brussels.

Surgery.—1. Esmarch's Bandage, Professor Esmarch. 2. Reciprocal Influence of Wounds on Pregnancy, M. Verneuil, Professor of Clinical Surgery at Paris. 3. Ozæna, M. Rouge, of Lausanne. 4. Articular Resections, M. Ollier, of Lyons. 5. Galvano-caustics, M. Juilliard, Professor of Clinical Surgery at Geneva. 6. The Transport of the Wounded in War. 7. Perineal Fistula, M. Reverdin, of Geneva.

Gynæcology.—1. Placental Souffle, M. Rapin, of Lausanne. 2. Artificial Feeding of Infants, M. Ziverfel, Professor of Obstetrics at Erlangen. 3. Anæsthesia during Parturition, M. Rechund, of Geneva. 4. The Law of Growth of Children during their First Year, M. Adier, of Geneva. 5. Pseudo-membranous Dysmenorrhœa, M. Gautier, of Geneva.

Public Health.—1. Influence of Alcoholism on Mental Disease, M. Magnan, of Paris. 2. Effect of Adulteration of Spirits upon those who Make and Consume them, M. Guillaume, of Neufchatel. 3. A Question of Medical Geography, M. Lombard, of Geneva. 4. Effects of the Immigration from the Country to Town, M. Durand, of Geneva.

Biology.—2. Analogy of the Discharge of the Torpedo Ray with Muscular Contraction, Professor Marey. 2. Cerebral Localisation, Dr. Broadbent, of London. 3. The Cause of Sleep, M. Preyer, Professor of Physiology at Jena. 4. Entozoa in Man, Professor Vogt, of Geneva. 5. Functions of the Kidney, Professor Schiff, of Geneva. 6. Histology of the Egg and the *role* of Zoosperms in Fecundation, M. Fol, of Geneva. 7. Physiological Antagonism, M. Prevost, of Geneva.

Ophthalmology.—1. Enucleation for Sympathetic Ophthalmitis, M. Warlomont, of Brussels. 2. Etiology and Prophylaxis of Myopia, M. Haltenoff, of Geneva: 3. Methods of Determining the Extent of (*a*) Distinct Vision, (*b*) Perception of Colour, (*c*) Refraction and Accommodation, (*d*) the Visual Field, (*e*) Mobility of the Eye, M. Fol, of Geneva. 4. Tenotomy of the Tensor Tympani, M. Colladon, of Geneva.

A Quarter's Mortality from Small-pox in England.

We have received from the English Registrar-General his last quarterly return; and as small-pox has been very prevalent since November last, and the subject has occupied considerable attention both in and out of the profession, we give the following summary of deaths :—

The fatal cases of small-pox registered during the quarter ending June 30, were 1,416, showing a decline of 527 from the number in the first three months of this year. The deaths from small-pox throughout the country steadily increased from 149 in the last quarter of 1875 to 1,943 in the first quarter of this year. The 1,416 in the three months ending June last, included 904 in London and its suburban districts, 315 in Lancashire, and 86 in Cheshire; while but 111 fatal cases were recorded in the rest of England and Wales. The annual death-rate from small-pox during the quarter, to a thousand living, was equal to 0·83 in Greater London, 0·41 in Lancashire, and 0·59 in Cheshire, whereas it did not average more than 0·03 per 1,000 in all other parts of England and Wales. Each of those rates, except that in Cheshire, showed a decline from those which prevailed in the first quarter of the year. No fatal case of small-pox was registered in thirteen English counties, or in ten of the twenty largest towns, among which the fatal prevalence of the disease was confined to London, Liverpool, Manchester and Salford, and Oldham. The disease caused 47 deaths in Birkenhead, 10 in Preston, and 6 in Ashton-under-Lyne; it was also locally fatal in Dartford, Orsett, South Benfleet, Glossop, Altrincham, Barton-upon-Irwell, and Lancaster.

The Sale of Food and Drugs Amendment Bill.

This Bill, the object of which is to facilitate the selling of watered liquor without risk of punishment, came on for its third reading on Friday last, and being opposed by Dr. Cameron and Mr. Meldon, was talked out until the House was counted. It is thus defeated for this session, and we hope for it a similar fate if Mr. Isaac should introduce it next year. If publicans wish to sell diluted spirits, or if the public wishes to buy it, the strengt hand price can be distinctly stated, and then there will be no roguery in the traffic.

The Cost of Irish Pauperism.

THE lately issued Irish Local Government Board report shows that there has been a reduction in the cost of Irish pauperism this year of £8,398, the total for 1875 being £771,553, and for 1876 £763,155. This is accounted for by the remarkable diminution in the number of paupers relieved.

There has been a decrease of £17,075 in the cost "in maintenance and clothing," but an increase of £2,628 in "out-door relief," of £450 in cost of "deaf, dumb, and blind," £3,048 in "salaries and rations of officers," and of £2,551 in "all other expenses, resulting in a net decrease of £8,398, while the decrease in the total number relieved has been 31,261.

The total expenditure of poor-rates for all purposes, viz., relief, medical relief, burial grounds, registration of births, deaths, and marriages, sanitary measures, and expenses under Superannuation Acts was in 1875, £975,044, making a poundage of 1s. 5½d. on the valuation. In 1876 the expenditure for all purposes was £1,045,505, being 1s. 6½d., an increase of £70,461, which increase is composed of £59,482 payments under National School Teachers Act, a newly created source of expenditure, and of an increase of £11,070 under Cattle Plague Act, less by a net decrease of £91 on other accounts.

A Clinical Ticket of the Old Time.

THE *Union Médicale* gives the following reprint of a ticket of admission issued in the year 1596 by the famous surgeon Guillemeau, pupil and friend of Ambrose Paré:

"H. D. Aderis, si placet, cras, hora decimâ, in templo Divinorum Cosmi et Damiani sacro, et pauperum piè visitationi.

"Actum, 4 Feb. 1596. GUILLEMEAU."

The Work Done by Irish Workhouses.

THE Irish Local Government Report, just issued, gives a rather hopeful account of Irish pauperism.

A decrease of 2,436 has taken place in the total number admitted in sickness during the year; a decrease of 26,112 in the number admitted who were not sick; a decrease of 1,439 in the number suffering from fever and other dangerous contagious diseases, and a decrease of 31,045 in the total number relieved; the numbers relieved during the year were less than the numbers relieved in any year since 1860.

This decrease of 31,000 persons in the pauper population maintained by the public is not due to any great increase in out-door relief, for we find, per the same report, that the persons subsidised outside the workhouses were only 993 more than last year.

Repression of Drunkenness in Galicia.

THE Chamber of Deputies of Vienna has voted for the repression of drunkenness in Galicia, the following law:—"No suit shall be maintained for the recovery of debts for liquor supplied when the debtor was in a state of drunkenness." Every person who has been punished thrice for drunkenness is forbidden to enter a tavern within the same year even when sober."

Deaths in Irish Workhouses.

THE mortality of the last year within the Irish workhouses contrasts favourably with that of former years. It appears from the report of the Irish Local Government Board just issued, that

The total number of deaths in the workhouses in the fifty-two weeks comprised in the table has been 10,129. In the corresponding table in the last annual report the total number of deaths was 11,333; so that there has been a decrease of 1,204 deaths, as compared with the number last year.

Deaths by fever were 612, as against 703; by lung disease, 1,633, as against 2,045; and deaths by small-pox only 2, as against 41 in last year.

THE English Pharmaceutical Society has at length emerged from its secret encouragement of counter-doctoring, and has openly taken the field as the champion of unlicensed practice. Its Council decided last week, by a majority of 12 to 4, to instruct its solicitor to defend, at the Society's expense, a counter-prescriber who is prosecuted for an infraction of the Apothecaries' Act. The Society had already descended from its legitimate position as guardian of pharmacy in England by undertaking the *rôle* of apologist for adulteration and all its concomitant rogueries. Now that its Council has accepted the championship of those who are engaged in making money by the breach of the law, the society may be assumed to be nothing superior to a trades-union, whose highest function is to protect the pockets of druggists. We honour the independence of Mr. Schacht and his three lieutenants who had the courage to remonstrate with the Council on the course which it proposed to adopt. They were plainly in earnest, and must have felt the honesty of their principles when they ventured to oppose the money interest of the voters.

WE understand that copies of a circular containing an engraving of the Colorado beetle have been sent by the government during the last few days to every parish in the country through the boards of guardians (in Scotland through the local authorities), to all chairmen of quarter sessions, and to the customs officers at the various ports. It has also been widely circulated by the Irish Privy Council. The Royal Agricultural Society and the agricultural newspapers have published similar illustrations. All this has been done in order to secure the active co-operation of everyone who is likely to meet with this troublesome invader.

THE meeting of the French Association for the Advancement of Science will take place this year at Havre. The session will extend from the 23rd to the 30th of August, and will include general and sectional meetings, scientific excursions, and public conferences. The meeting will be opened by Professor Broca as President, the Vice-President being M. Hulkmann, the chemist of Lille, and the Secretary being M. Dehéran.

THE resident population of the United Kingdom in the middle of 1877, is estimated at 33,444,419; that of England and Wales at 24,547,309; of Ireland at 5,336,395; and of Scotland at 3,560,715. The birth-rate in the United Kingdom in the second quarter of 1877, was 35·2 per 1,000; and the death-rate 21·2 The marriage-rate in the first quarter of 1877 was 13·3 per 1,000.

THE subjoined City companies have contributed to the

Repairs and Improvement Fund of the Westminster Hospital as follows:—Grocers' £100, Goldsmiths' £100, Mercers' £105, Fishmongers' £52 10s., Merchant Taylors' £26 5s., Cutlers' £26 5s., Skinners' £21, and the Clothworkers' £21, annually to the general fund.

H. R. Swanzy, M.B. Dub., F.R.C.S.I., Ophthalmic Surgeon to Dr. Steevens' Hospital and to the National Eye and Ear Infirmary, Dublin, has been appointed Professor of Ophthalmic and Aural Surgery in the Royal College of Surgeons in Ireland, vice Dr. Wilson, deceased.

William Roe, M.D. Q.U.I., F.R.C.S.I., Assistant Obstetric Surgeon to the Coombe Hospital, Dublin, and Examiner in Midwifery in the Royal College of Surgeons in Ireland, has been elected Professor of Midwifery in the College, in the room of Dr. Cronyn, deceased.

BRITISH MEDICAL ASSOCIATION.

Forty-Fifth Annual Meeting.

[From Our Special Correspondent.]

Victoria Park, Manchester, Tuesday, Aug. 7.

In my last letter, I gave the programme for the week, the inauguration of the meeting in the Cathedral by the Bishop of Manchester, and the text from which he preached a short but eloquent Sermon. I could give you no more than this by Telegraph; and considerable surprise was manifested amongst the members of the Association when the Journal reached Manchester by first post on Wednesday morning, that it contained even so far of Tuesdays' proceedings. I will not encroach upon your valuable space by giving his Lordship's sermon in full, but as he is known to be a divine of the broadest, most liberal and enlightened school, I will content myself by giving just a few quotations, from the sermon, the text being as your readers are already aware: "It doth not yet appear what we shall be." To those, remarked the preacher, who held the merely physical theory of being, who saw in matter the promise and potency of life in every form, who accounted for even the phenomena of what used to be called volition by the reflex action of a muscle or a nerve, the very existence of those imaginings, those hopes and fears, should seem to be a problem of no slight difficulty. It was possible, as Professor Tyndall had said, "that many who hold the hypothesis of natural evolution would probably assent to the position that at the present moment all our philosophy, all our poetry, all our science, all our art, Plato, Shakespeare, Newton, are potentially in the fires of the sun." But it would seem to require a further reach of the imagination in the province of science to conceive that the fires of the sun could have implanted even potentially in the human soul the hope of immortality; still more so if, as some told us to-day, it was a hope destined never to be realised. For there it was, a hope deep-seated in the heart of man, and, like every other phenomenon, it was to be accounted for, and as it was not pretended by anyone to be within the range of mathematical demonstration or physical experiment, the most reasonable hypothesis must be accepted. Everyone must admit there had been either developed or implanted in the human mind the hope of immortality, and here the mere physicist was brought to a pause; he could not explain the phenomenon consistently with his purely physical principles. It seemed to him that he ought to try to explain it away; it was, to say the least, an unexpected and awkward result of a course of material atoms, whatever the arrangement of their poles or the tendency given to their powers. And if he could neither explain nor explain it away, he was bound upon his own principles at least to listen to the hypothesis of one who had been studying in another but not an antagonistic school. If this hope of an indestructible life did exist, might it not have come from God And was not the mystery of our being solved, though not with the precision of scientific language, by the Old Book, which told us that the "Lord God formed man, and breathed into his nostrils the breath of life, and man became a living soul?" Admitting the fact of a living personal God, there need be no insuperable nor even serious difficulty in admitting the fact of revelation, whether in the narrower sense in which sometimes the idea of revelation was confined to the inspired record of the Bible, or in that broader and Pauline sense in which even to the heathen God was said to have shown His own attributes and their destiny. . . . The gentlemen he was now addressing had ample opportunities of observing the tenacity with which the spirit clinged to that eternal life which it believed it had in Christ Jesus. It was indeed surprising how little modern criticism or modern scientific inquiry had done to undermine those old foundations upon which all religion in its very idea, and Christianity, as religion in its highest form, must ultimately repose. It was only one here and there who told them that the idea of a personal God was an unverifiable hypothesis; and even such recognised in the circumstances around them a stream, a tendency that made for righteousness. It was only one here and there who defrauded humanity of its brightest hopes and most sustaining motives by denying to it immortality, and even such, as if conscious of their wrong, endeavoured to find a substitute for the idea which they had destroyed, which indeed proved illusory, but which they seemed to feel indispensable. In conclusion, his Lordship said: No doubt there are some sad souls—

Mad from life's history,
Glad of death's mystery,
Swift to be hurled,
Anywhere, anywhere,
Out of the world.

In the dim gloom that shrouds all beyond the grave there is yet a streak of light, like some sudden lightning flash, illuminating the darkness with hopes full of immortality. In the silence of the chamber of death there is still a voice heard, "He that liveth and believeth in Me shall never die." I trust, gentlemen, representatives of a noble profession, that His spirit who, in the strong but not strained language of St. Paul, illuminated death with immortality may guide you in your discussions to the furtherance within your legitimate and important sphere of those high human interests for which He died.

After luncheon the first general meeting of members was held in the Concert Hall at three o'clock, under the presidency of Dr. M. M. de Bartolomé, of Sheffield. There was a very large attendance, the hall being nearly filled.

The minutes of last meeting were taken as read, and confirmed.

Dr. Falconer (Bath), Treasurer of the Association, moved that Dr. M. A. Eason Wilkinson be appointed President of the British Medical Association for the ensuing year.

The motion was seconded by Mr. W. W. Husband, F.R.C.S. (York), and carried unanimously.

Dr. Bartolomé in retiring from the presidential chair, referred to the great courtesy with which he had been treated during his period of office, and the unqualified support which he had received from the Association. The past year, he said, had undoubtedly been a most uneventful period, for they had not even had a medical squabble to distinguish it, and therefore his life had been one of *otium cum dignitate*. There was one incident, however, which he would always look back with perfect satisfaction upon his presidential period. All branches of the community, they must be aware, were recognised in some way or other by the powers that be, and they well knew that the colliers of Pontypridd had recently been rewarded for their heroism in the disaster which occurred lately in Wales. Some members of the medical profession were quite as heroic as these colliers, yet their services were less valued. They were accustomed to this state of things, however, jus as eels were accustomed to skinning. (This little tirade was followed by considerable laughter and clapping of hands, amidst which Dr. Wilkinson, who is one of the Physicians at the Manchester Royal Infirmary, took the chair.)

Dr. Chadwick moved that the warmest thanks of the Association be accorded to Dr. De Bartolomé for his past services as President, and also that he be appointed Vice-President for life.

The motion was seconded by Dr. M'Intyre, and carried unanimously, after which Dr. Bartolomé acknowledged the compliment.

The President's Address.

The President then delivered his Inaugural Address, thanking the members for the honour conferred upon him in electing him President of the Association, and giving them a hearty welcome to Manchester. He took as his subject the Manchester Infirmary, its history, its future, and, connected with this, the general subject of hospitalism, treating it after the most approved system of our times. The address was of more local than general interest.

On the motion of Dr. Gairdner (Glasgow), seconded by Dr. J. A. Favell (Sheffield) a vote of thanks was passed to the President for his address.

Dr. Andrew Clark (London) moved the adoption of the report of the Council, which showed that the number of members had largely increased during the year, and that the financial affairs of the association were in a flourishing condition. The report also referred with satisfaction to the adoption of the medals adverted to in the speech of the ex-president.

The motion was seconded and agreed to.

The Secretary (Mr. F. Fowkes) read the annual report of the Council, which detailed the work that had been done during the past year. The total balance of assets over liabilities on the 31st Decsmber last was £4,241, and the revenue had increased by £797. The Association continued largely to increase in numbers. The new members for the year were 729, the deaths 63, and the resignations 65, leaving a total number of members of 7,147.

The report was adopted on the motion of Dr. A. Clark, seconded by Mr. Lund (Manchester).

The general meetings are never very interesting affairs, and this was, if possible, less so than usual. Gradually the hall thinned down to a few, which became beautifully less as the last of the routine work was got through. The customary votes terminated the sitting.

Wednesday, August 8.

The sittings were resumed this morning at half-past nine o'clock, when there was a meeting of the council, and subsequently a meeting of the Scientific Grants Committee was held. The second general meeting of the Association took place at half-past eleven o'clock, in the Chemistry Lecture Theatre of the Owens College. The President, Dr. Wilkinson, occupied the chair, and the spacious apartment was crowded.

The President of the Council (Dr. Falconer, Bath) said that as no invitation had yet been received with reference to the next annual meeting, it was proposed to empower the Committee of Council to make the necessary arrangements.

Dr. Wade (Birmingham) therefore moved that the Committee of Council be empowered accordingly, and to appoint the president elect.

Mr. Husband (York) seconded the resolution, and it was agreed to.

Dr. W. Roberts, physician to the Manchester Royal Infirmary, then delivered a most learned and thoughtful address on Medicine, choosing for his subject the doctrine of contagium vivum and its application to medicine, which I have the pleasure to send as an instalment of sound mental pabulum for the careful digestion of your readers. (The address referred to will be found at page 121.)

Sir William Jenner, Bart., moved that the best thanks of the assembly be given to Dr. Roberts for his clever exposition. He thought their thanks should be given very warmly to him. If the address had been a moderately able one, or if it had been what they called an able and interesting address, he was sure they would have thanked him warmly for having taken the trouble to prepare and deliver it. But this was something more than a merely able address. It was one of the most able and most interesting addresses he had ever listened to—and he did not hesitate to say that although they or he might not have agreed with every word, they would have agreed with very nearly every word; and, moreover, he believed it would be a new starting point for advances in a certain class of diseases. He trusted they would give their heartiest thanks to Dr. Roberts.

Dr. Paget (Regius Professor of Physic at Cambridge University), in seconding the motion, said that coming from a distance perhaps he might be allowed to congratulate the Council of Owens College on what they had heard that morning. Of course, one had heard of the great teaching power of the Owens College, but if what had been heard that day was an average of the teaching power he thought the college in its medical department must rival any of the first schools of medicine. He might venture also to congratulate the medical council on having selected Dr. Roberts to represent them, and he thought all the medical profession in Manchester must be satisfied and proud of such a choice.

The motion was carried amidst much cheering.

Presentation to the Pontypridd Surgeons.

At the conclusion of the proceedings connected with Dr. Robert's address, an interesting ceremony took place in the presentation of medals and illumined addresses to the surgeons who were professionally engaged in the colliery accident at Pontypridd.

Dr. Falconer (Bath) said he had been asked by the President to make a short statement with regard to the conduct of the medical men who were concerned in the treatment of the miners in the severe colliery accident at Pontypridd. He (Dr. Falconer) thought the meeting would agree with him that those gentlemen had exhibited great powers of perseverance, for they were, many of them, confined in the mine for days and nights waiting for the liberation of the entombed miners. He read a statement which had been drawn up by Dr. Sieveking, which stated that from the 11th to the 21st April, 1877, a boy and four men were imprisoned in the Tynewydd Colliery without light or food. The stimulating influence of the presence of the medical men aided largely in encouraging the miners to persevere in their attempt at the rescue of their fellow men, and that their presence had a similar effect upon the imprisoned men was, he said, manifest from the fact that as soon as they could be communicated with the first thing they asked was, "Are the doctors there?" The two young men, Messrs. Dukes and David, were the first who, after the communication had been effected, crept through a narrow channel at the peril of their lives. The doctors when in the pit were in the same peril as the working miners, and were without the stimulus of bodily work as a relief to the depressing influences of surrounding circumstances. The Association thought the occasion one which exhibited in a peculiar manner the highest qualities of the British medical man, and one which showed to the world his self-sacrificing spirit—and they had, therefore, unanimously agreed that they would found a medal to be bestowed for distinguished merit, and that the first recipients should be the medical men engaged in the rescue of the entombed miners at Pontypridd. He described the particular services rendered by each of the gentlemen, who were called to the platform amidst the cheers of the meeting.

The President then presented the addresses to the following gentlemen, it being announced that the medallist had not completed his work in time for their presentation to-day:—

Gold Medal to Mr. H. N. Davies, surgeon to the colliery. Silver Medals to Mr. Washington, David Edgar Dukes, and William Stephen Davies. Bronze Medals to Thomas William Parry, Charles John Jones, Francis Henry Thompson, George Neal, Philip James, Rees Hopkins, Ivor A. Lewis, and Edward Lloyd.

Dr. Bartolomé said they were remedying the *laches* of others, and the shortcomings of those who, he humbly thought, ought to know better. He moved that in future the medal of the Association be given as the special reward for distinguished merit on the part of medical men.

Mr. Husband (York) seconded the motion, which was passed.

The proceedings were then concluded. The several sections met in the afternoon.

PUBLIC HEALTH SECTION.

The public health section met in the History Lecture Room at two o'clock, under the presidency of Surgeon-Major F. S. B. de Chaumont, M.D. Seven papers were read in this section. Dr. Arthur Ransome read a short paper on "Epidemic cycles;" Dr. J. L. Notter, of Netley, on "The chemical theory of contagion compared with the corpuscular theory, with special reference to the action of disinfectants;" by Dr. T. M. Dolan, Halifax, on the "Etiology of typhoid fever, with special reference to the discusssion in the French Academy of Medicine;" by Dr. Hadden of Eccles, on the "Incubation and duration of infection;" by Dr. Bushell Anningson, of Cambridge, on the "Infective Constituents of Vaccine Lymph;" by Mr. Vacher, of Birkenhead, "Notes on the life-history of contagium;" and Mr. Adam Scott gave some facts referring to the Dutch laws of compulsory registration and stamping out of infectious diseases.

THE OBSTETRIC SECTION.

Dr. Priestley (London) presided over this section. In his opening address he said that when the invitation to accept the presidency of the obstetrical section at the present meeting of the British Medical Association was forwarded to him, it struck him it would be interesting to look back on the part which Manchester had, from time to time, taken in the advancement of obstetric science, and recall some of the great names who had contributed to its literature. Manchester, indeed, had had its school of obstetric medicine as well as its school of politics. It had made its mark both in the present and in the preceding century. So long ago as 1773 Mr. Charles White, a pupil of William Hunter, and surgeon to the Manchester Royal Infirmary, wrote a treatise on the management of diseases of women which went through three editions, and in 1784 another work of a similar character was published. Probably no single locality in the United Kingdom had contributed so much as Manchester and its vicinity to the discussion and elucidation of the subject of Cæsarean section. Of fifty-five cases in England and Wales, collected by Dr. Radford up to 1865, no fewer than twenty-five had occurred in Lancashire. The occurrence of this large proportion of Cæsarean operations in Lancashire, was, no doubt, in a great measure due to the pernicious influence surrounding the occupation of young girls and women in factories. Cogent evidence of this was to be found in the fact that since the introduction of the Factory Act, which prohibits girls from being employed in factories before a certain age, and limits the hours of work both for women and children, the necessities for the Cæsarean operation had become much rarer, and Lancashire was losing its unhappy preeminence in this respect. This, one of the indirect ways in which the Factory Act had ameliorated the condition and lessened the danger and suffering of poor working women deserved to be recorded, and must furnish a source of gratification to Lord Shaftesbury and others who were concerned in passing this beneficent measure. Since the last meeting of the British Association in Manchester considerable strides had been made in perfecting the science and art of midwifery, and in treating and investigating the diseases of women. It would be in the recollection of many members that at the meeting of the Association in London there was a discussion on transfusion, and a lively debate took place between the advocates of mediate and the supporters of intermediate injection. Just now new life had been imparted to the subject by the appearance of M. Roussell demonstrating the utility and simplicity of his method for direct transfusion. The subject was obviously a study of deep and increasing interest, as the introduction and practice in a perfect and simple form of transfusion might be the means of saving many from the jaws of death. He commended it to their careful consideration. (Applause.)

Dr. Lloyd Roberts (physician to St. Mary's Hospital, Manchester), read a paper on "Transfusion."

A paper by M. Roussell, M.D. (Geneva), also dealing with the question, was read by Dr. Lloyd, M. Roussell being unable to speak in English.

Professor Martin (Berlin) said that if they adopted transfusion they must transfuse only in cases where the patients were faint and evidently sinking, and they should use human blood, and not the blood of the lower animals. The apparatus employed should be of the simplest nature.

Dr. Atthill (Dublin) exhibited and described the apparatus invented by Dr. Roberts, of Dublin, for transfusion. With regard to transfusion, he believed it to be a very advantageous operation in some cases, but he was not satisfied on the other hand that it was not altogether free from danger. He was in favour of the use of defibrinated blood for transfusion, and opposed to direct transfusion.

M. Roussell, M.D., then gave a description of the instrument he had invented for performing the operation of transfusion. He insisted that the blood taken from one person and introduced into another should contain no air; it should not be allowed to come into contact with atmospheric air in any way.

A paper relating to obstetric surgery was then read by Dr. J. Matthews Duncan (Edinburgh), and after a long discussion the meeting adjourned.

PSYCHOLOGICAL SECTION.

Dr. J. C. Bucknill, F.R.S. (president), read an introductory address on the treatment of the insane, and upon the importance of psychological knowledge in the treatment of disease.

A discussion followed on the treatment of habitual drunkards, opened by Mr. G. W. Mould, who advocated the general establishment of retreats where habitual drunkards might be placed under control for stated periods.

Dr. Norman Kerr, remarking upon the difficulty of reforming habitual drunkards, said that until within the last few years he had visited many inebriate establishments, but had never known more than 30 per cent. of males and 3 per cent. of females permanently cured. He had, however, recently visited an establishment for females where the number cured was said to be 60 per cent. He condemned the granting of grocers' licenses as a most demoralising system, and advocated an Act of Parliament legalising the detention of habitual drunkards.

Dr. Moore, medical officer of the Belfast Gaol, thought habitual drunkards should be committed to prison for an indefinite period, only to be released when cured.

Dr. Parker, surgeon of the Liverpool Borough Gaol, thought that reformatory institutions should supplement prisons, and that, after serving a period of imprisonment, convicted drunkards should be sent to those reformatories until cured. Until some such steps were taken he was afraid no great improvement would be effected.

Several other speakers supported this opinion, and urged that such reformatories could be made self-supporting.

Dr. Rogers, of Rainhill Asylum, thought there was a great deal of hypocrisy running through the discussion. Was it right that members of the Association, after enjoying as they did the good things of this life, should advocate, so coolly, the sending of so many poor persons to prison? He thought the law, as it now stands, was sufficient to put down drunkenness if it were fully enforced, and urged that it was unjust to punish the drunkards and let the seller of the drink go free. In opposition to what one gentlemen had said, he thought the granting of grocers' licences a beneficent measure.

The following resolution was then agreed to:—"It is the opinion of the psychological section of the British Medical Association that legislative action is imperatively necessary for the treatment of habitual drunkards, and that object could best be attained by the establishment of distinct institutions for their treatment."

A second resolution was also passed to the effect that reformatory institutions should be established to supplement prisons for the reception of persons convicted of drunkenness.

THURSDAY, AUGUST 9.

The third general meeting took place in the Chemical Theatre at ten o'clock; Dr. Falconer (Bath) presiding.

At eleven o'clock Mr. Spencer Wells (London) delivered

THE ADDRESS IN SURGERY,

which will be found on page 126.

On the motion of Mr. E. Lund (Manchester), president of the Surgery Section, seconded by Professor M'Leod (Glasgow), a vote of thanks was passed to Mr. Wells for his address.

THE MEDICAL SECTION.

The medical section was very largely attended, Sir William Jenner presiding. In introducing the business of the section, he thanked the council of the Association for the great honour they had done him in appointing him president on that occasion. At the same time he owned that he felt there was some fitness in the selection made by the council, that he was to some extent in his proper place as president of the medical section at that special meeting, for the address on medicine had been delivered by a physician whom he was proud to be able to claim as a former pupil, and two of the three vice-presidents, and one of the two secretaries of the section owed some, at least, of their rudimentary knowledge of medicine to his teaching. One great good flowing from all such meetings, was that the papers which were read, and discussions which of necessity arose, awoke in those who took part in them, and in those who were listeners only, new ideas, and gave form to ideas heretofore imperfectly defined in their minds, and did that which for all men was so essential—forced to think. Again, as men talked one with another, new modes were discovered of looking at old things, prejudices faded away, identity of fact and meaning was found to underlie differences in words, and by comparing their own observations, and their conclusions, with those of others, they corrected the former, and rectified the latter; and thus, although at the dispersion

of gatherings such as that of men of science, it might not be able to be said that any branch of the science represented at the meeting had received an addition which might not have been made in other ways, it could be asserted, without fear of question, that not only had knowledge been spread, but also that an impetus had been given of the most forcible and purest kind to the advancement of knowledge in the future, which impetus could not have been given in any other way; men's minds had been excited to think in new directions, to carry their thoughts into action, and prejudices—those drags on the acquisition of knowledge—had been lightened. But from the social associations which formed part of the meetings another and a better good flowed. Hearts were opened to feel more kindly towards their professional brethren, and they became conscious of a common brotherhood. He could not conclude without expressing, in the name of the section, the pleasure it would give them all if their foreign visitors—men renowned throughout the world, would take part in the discussions. He had said their "foreign" visitors, but in science generally, and in the profession of medicine especially, there should be no foreigners. They had a common language, and sought one treasure, truth, a treasure which as soon as it was discovered was the common property of all. In the world of science, and of medical science in particular, all worthy workers were communists. They knew nought of geographical nations, and race for them had no existence. (Loud Applause.)

A paper on the varieties of phthisis, illustrated by coloured plates, was read by Dr. Andrew Clark, Dr. Bradbury and Dr. Henry Simpson (Bowdon) followed, the former referring to a case of hydatid tumour of the left kidney being successfully treated by aspiration, and the latter to the treatment of internal aneurism. Dr. Philipson (Newcastle-on-Tyne) next described two cases of abdominal aneurism, one cured by iodide of potassium, the other by arterial compression. Dr. R. T. Roberts (Manchester) read brief notes of cases illustrating the diagnosis and treatment of internal aneurism, and Dr. Mahomed gave an abriged paper on indications for the diagnosis and treatment of aortic aneurism. A discussion on aneurism followed, after which the meeting terminated.

The annual dinner in connection with the Association was held at the Assize Courts, Manchester, in the evening, under the presidency of Dr. Eason Wilkinson. The banquet was attended by nearly 400 guests, and amongst the company were the Bishop of Manchester, Sir Henry de Bathe, Mr. Birley, M.P., Sir William Jenner, Professor Ludwig, Berlin; Dr. Sayre, New York; Professor Charcot, Paris; the Mayor of Manchester (Mr. Alderman Heywood), the Mayor of Salford (Mr. Alderman Walsley), Dr. Falconer, Bath, President of the Council; Dr. Matthews Duncan, Edinburgh; Dr. Haughton, Dublin; Dr. Borchardt, Manchester; Dr. Chadwick, Tunbridge Wells; Professor Greenwood, Principal of Owens College; Mr. W. H. Higgin, Q.C.; Dr. Gairdner, Glasgow; Dr. Bucknill, London, &c. The usual toasts were proposed and responded to, the proceedings terminating about eleven o'clock.

FRIDAY, AUGUST 10th.

THE LAST GENERAL MEETING.

The last general meeting was held in the afternoon, in the Chemical Lecture Theatre; the President (Dr. Eason Wilkinson) in the chair.

The report of the habitual drunkards committee was read by Dr. Eastwood (Darlington).

A resolution adopting the report, and re-appointing the committee was unanimously passed.

The report of the committee appointed jointly by the British Medical Association and the Social Science Association, to deal with the subject of State Medicine, was presented by Dr. Stewart (London). It contained the following passages:—

The joint committee acting on the resolutions adopted at the Sanitary Conference held in London on the 11th and 12th of May, 1876, have prepared a memorial carrying out the spirit of those resolutions. This memorial was forwarded to Earl Beaconsfield on the 18th of June last, with a request that he would consent to receive a deputation on the subject. The memorial recommended: 1. That the present existing distinctions between urban and rural sanitary districts should be removed, and that all sanitary authorities should be clothed with similar powers; and that these powers should be extended in order to enable them to carry out all purposes of local administration within their district. 2. That in each county, or division of a county, a representative authority of a high order should be constituted for the execution of joint works, to aid, and in case of default to exercise control over, district sanitary authorities. The joint committee much regret that his Lordship's engagements would not allow him to receive the deputation. The joint committee more and more impressed with the necessity of urging forward the reforms set out in the resolutions of last year, and the memorial based on them, have determined by every means in their power, and especially by the wide distribution of the resolutions and memorial, to give the greatest possible publicity to the steps they have hitherto taken in the matter, and they are not without hope that the question may be taken up in Parliament by leading politicians, and that the Government, who are already pledged to do something towards the formation of county boards, may be induced seriously to consider the necessity of a radical change in sanitary administration.

Dr. Bond (Gloucester) moved that the report should be received and adopted and the committee re-elected. In doing so he said it was aggravating to hear of the cavalier way in which the Prime Minister had received the joint committee's request for an interview. A minister who had entered office with sanitary reform as one of his leading cries, and who declined at so early a period of his administration even to consider suggestions made for the benefit of the public health by two such bodies as the British Medical and Social Science Associations, did not hold out by his conduct much ground for sanguine expectations of progress in the direction to which he had originally called public attention. This being the case, he (Dr. Bond) was afraid that the joint committee's hope that the country would be blessed with a Minister of Public Health was not likely to be gratified.

Mr. Armstrong (Harpurhey, Manchester) seconded the resolution, which was passed without opposition.

The report of the parliamentary bills committee was presented by Mr. Ernest Hart (London), and was taken as read.

On the motion of Mr. Robert Dunn (London), seconded by Dr. Begley (Hammersmith), the report was adopted, and the committee's successors for the ensuing year appointed.

The report of the chloroform committee was read by Dr. Waters (Chester). It stated that the committee recommended the association to appoint a sub-committee of research, to consist of the following medical gentlemen, all of whom belong to Glasgow:—Dr. Ramsey, Dr. Coates, and Dr. M'Kendrick, Professor of Physiology at Glasgow University, the latter gentleman to act as chairman and convener. It was also recommended that for the purposes of this sub-committee of research the scientific grants committee should make a fresh grant of £50. These investigations in connection with anæsthetics had, said Dr. Waters, been conducted since 1866, and they were giving to the association a character for promoting science and original research which redounded greatly to its credit.

Mr. Robert Tiffin (Wigton, Cumberland) seconded the motion, which was unanimously carried.

The report of the medical reform committee was read by Dr. Waters (Chester).

Dr. Waters moved that the report should be adopted and the committee re-appointed.

Professor Haughton (Dublin) seconded the resolution.

Mr. Ernest Hart (London) moved a rider to the resolution, instructing the committee to prepare a short bill and introduce it in the next session of Parliament for the purpose of amending the 40th (penal) clause of the Medical Act of 1858.

Dr. Nelson Hardy (London) seconded the proposal for the adoption of the rider.

On a division the resolution, with the addition of the rider, was carried by a large majority,

The following resolution, which was based on one previously passed in the psychological section, was, on the motion of Mr. Hart, carried unanimously:—

"That a committee be appointed, with full authority to use the influence of the association, to promote such changes in the administration of out-patient relief at hospitals as they may find necessary, and that the working of the present system of provident dispensaries in Manchester be carefully investigated and reported upon."

The Chairman announced that a letter, signed by Mr. E. Seguin, chairman of the American delegation in Manchester, had been received by himself. It expressed thanks to him and to the association for the brotherly reception accorded to the representatives of the medical profession of the United States. The delegation hoped that by the proposed introduction of more uniformity into the practice of physic the high standard of the English physicians would be more universally acknowledged, and they offered the heartiest encouragement to those who laboured with the Charity Organisation Society, London, for the legal recognition and medical treatment of all idiots and feeble-minded children as wards of this generous and mighty nation.

The passing of the usual votes of thanks terminated the meeting.

GARDEN PARTY AT MANLEY HALL.

A garden party was given in the afternoon at Manley Park by the President and reception committee of the association. There was a very large assembly, consisting not only of members of the association, but also of a large number of the general public, to whom invitations had been issued, and the hall and its handsome grounds were thrown open. The bands of the King's Dragoon Guards, of the 106th Light Infantry, and of the Theatre Royal, Manchester, were stationed in different parts of the park, and during the afternoon gave admirable musical selections. The park being now in beautiful condition, the afternoon proved one of universal pleasure.

THE INFLUENCE OF THE MEETING.

I shall not at present estimate the value of this meeting in its purely scientific aspect, but I may point out one influence it may have—viz., of assisting Manchester in securing a charter for a university.

It would be out of place for me to discuss here the question of the special claims of Owens College in reference to a charter of incorporation; but as surely as this claim is pressed on the attention of Government so surely will the flourishing Yorkshire College of Science at Leeds also put in a claim. The Yorkshire College is already no mean rival of the older established Owens College, and in some respects altogether superior, whilst in the principle of its foundation it is especially adapted to the requirements of the district.

This is not my own opinion, but the feeling widely expressed and circulated in Yorkshire journals. No one will deny that much has been done by Owens College towards the furtherance of higher education in Manchester; yet each of the numerous academical institutions which are scattered over the country, and which are at present similarly affiliated to the University of London, has an equally just and strong claim to the privileges of independence and the degree-granting power now urged by Manchester. If the grounds are valid upon which affiliation to the University of London is now irksome to Owens College, and if, as the authorities set forth, it is prejudicial to its interests and advancement, and fettering to the scope of its utility; is it not fair to reason that the same arguments which they employ now would be urged, and with far greater force, by the Yorkshire College of Science against compulsory attachment to a University of Manchester? It is an open question whether we require any more universities, and whether a large town is a desirable site. Why should not Durham University be utilised, galvanised into life, remodelled to meet the requirements of the age, its degrees be elevated and rendered in every way worthy of recognition and attainment.

SPECIAL REPORT
ON NEW INSTRUMENTS, SURGICAL APPARATUS, CHEMICAL AND SANITARY APPLIANCES.

"Justitiæ partes sunt non violare homines."—CICERO.

THE additions to the *armamentaria* of the surgeon have been very great of later years, principally consisting of improvements, alterations, and modifications of old instruments; and individual talent has been devoted, oftentimes with an energy worthy of better channels, not only to the improvements of the instrument, but also to the receptacle intended for its use.

The facility for acquiring a name and notoriety, if not fame, has developed a certain amount of fertility in the invention of patent bags, *et id genus omne*, and Fashion—the arbiter and rule of right—has produced too many imitators of this system. We suppose, in this respect, we can hardly expect any reformation, for such innovators and inventors are guided by "tickling commodity—commodity the bias of the world."

On entering the surgical room, we are struck by the number of instruments required in our art and the manifold miseries that humanity suffers from; and on looking at the gathering, we are reminded of the numerous patients whom the unskilful surgeon "with this obedient steel, three inches of it, can lay to bed for ever."

The instrument makers were well represented, and they all seem inspired by the same idea, and evidently impressed on their representatives the motto—"In te omnis domus inclinata recumbit" ("On thee the fortunes of our house depend"); so that it is a difficult task to point out the special merits of each selection, and to do justice to each firm. I shall begin with

MAW, SON, AND THOMPSON'S, Aldersgate Street, London—"Magni nominis umbra" (The shadow of a great name). They exhibited every form of surgical, medical, and obstetrical appliance, from a lancet to a catheter; and their catalogue includes cephalotrites, syringes, enema apparatus, bougies, inhalers, throat instruments, midwifery instruments, galvanic and faradic batteries and other special requirements of the surgeon.

In spite of the fury of modern innovators, there are a few old appliances that have resisted change and still retain their primitive simplicity, and will with difficulty be supplanted, as the stethoscope and the forceps.

Hamlet.—"Will you play upon this pipe?"

Guild.—"My lord, I cannot!"

Stethoscopes in all branches were shown, differing in length, thickness, wood, and colour; whilst their display of forceps was also very good, though they had the two latest additions to this special form of instrument, in the shape of Tarnier's and Christie's forceps.

The MEDICAL PRESS AND CIRCULAR was the first to introduce Tarnier's, with plates, and as Dr. Christie has also in your issue of Aug. 8th, explained the benefits of his own, I need not dwell upon them.

On looking over their other obstetric instruments, we almost regret that the ladies of our day cannot imitate Monemma of whom we read—

> But now her time is come, and none is nigh
> To help, but human help she needed none;
> A few short throes endured with scarce a cry,
> Upon the bank she laid her new born son,
> Then slid into the stream, and bathed, and all
> was done.

Such a system would be bad for the obstetrician and his assistant, and there would be little use for Maw's very excellent obstetric, gynæcological, or accoucheur's bag.

Dr. Roussel, of Geneva, has several instruments on exhibition, made for him by this firm, viz., a tractor, an instrument for the treatment of strangulated hernia, an apparatus for the treatment of stumps after amputation, resection, fractures, and his well-known transfusor. In reference to batteries, this firm has paid great attention to their construction, and their 50 and 20 cell constant current battery, their 30 and 50 cell constant current (Léclanche) element batteries, are excellent specimens of workmanship, and will recommend themselves by their efficiency and economy.

ARNOLD AND SONS, Smithfield, London—(with different talents formed we variously excel).

Arnold's specialities have been long before the profession, and their name for accuracy and neatness of finish, for solid and good workmanship is now established. Their case included every recognised form of instrument, amongst which we specially noticed their obstetric bag, their surgical bag, Tibbits, constant current batteries, their improved aspirator, sphygmograph improved, and Davy's instrument for talipes equino-varus, and valgus.

WEISS AND SON, Strand, London.

"Quid dignum tanto feret hic promissor hiatu." (In wha will all this ostentation end.

This firm had a large show of major operating cases, as Thompson's, for lithotomy and lithotrity, and a very beautiful

and expensive eye-instrument case, which would be appreciated by any one having . . . . "a mote, a grain, a dust, a gnat, a wandering hair, any annoyance in that precious sense."

MEYER AND METZLER.

Their speciality was Dr. L. A. Sayres' apparatus used for extension in cases of Pott's disease of the spine, and for which he is now in England, showing how he can "Set a form upon that indigest which He hath left so shapeless and so rude." Their portable case for attending the wounded in the field is very cheap and good.

AITKEN, York.

"Nos populo damus." (As the world leads we follow).

This old firm, well known in Yorkshire and northern districts, had a very superior display and a very good class of instruments.

COXETER AND SONS, Grafton Street, London,

Were well represented, and showed some of their specialities.

MILLIKIN AND CO, Borough, London,

Had a very fair display.

HOLDERNESS AND CO., 41 Corporation St., Manchester.

"Tentanda, via est, qua me quoque possim
Tolere humo, victorque virum volitare per ora."

(New ways we must attempt, our local name to raise aloft, and wing our flight to fame.)

This is a new firm devoted to the supplying of surgeons, sundries, and they had a good collection of the usual articles for surgery, midwifery, etc.

A. YOUNG AND CO., Edinburgh,

were especially strong in instruments used in the antiseptic treatment, and showed Lister's most improved patterns of instruments.

SALT AND SON, Birmingham,

Had a very large and extensive display.

FERRIS AND CO, Bristol,

Had a very large assortment.

I may say of the rest—

"Sunt bona, sunt quædam mediocra, sunt mala plura."

(Some good, more bad, some neither one nor other.)

NEW DRUGS—ARTICLES OF DIET.

The exhibitors in this department were very badly placed, and many did not visit them in consequence of their being away from the general building.

The firms that combined the selling of surgical instruments with drugs were more fortunately situated, as they were placed in the surgical instrument section, but their display of preparations of medicine was not as good as those who devoted themselves exclusively to this special department.

I may mention the stand of Messrs. Corbyn, Stacey, and Co., and draw attention to some of their specialities :—

Calamina Præparata.—The difficulty, amounting almost to impossibility, of obtaining good calamine is very great. The lumps should be carefully selected at the mine and rigorously picked over. The subsequent grinding and levigating between heavy horizontal stones, should result in the production of an exceedingly smooth and soft powder. Dr. Tilbury Fox says, that "calamine powder should be a natural article, not a manufactured one ; of a very pale salmon colour, and free from grittiness." Of the calamina præparata now offered, the same authority says that "it is excellent in every respect."

Coca Leaves (*Erythroxylon Coca*).—These leaves, either alone or with a little lime, are habitually chewed by the natives in some parts of South America, and are said to enable them to perform extraordinary tasks without fatigue.

The specimens we saw were very good, the aroma was excellent, and were evidently gathered with care.

Perles.—Apiol, gr. 2 ; Calcium Sulphide, gr. ½ ; Carbolic Acid, m. 1 or 2 ; Chloroform, m. 3 ; Creasote, m. 1 or 2 ; Croton-oil, m. 1 ; Erigeron-oil, m. 10 ; Ether, m. 5 ; Goudron de Norwege—Tar, m. 3 ; Monobromo—Camphor gr. 3 ; Phosphorus, gr. 1-30th, 1-60th, and 1-100th ; Potassium Sulphide, gr. ½ ; Sandal-wood oil, m. 10 ; Sodium Sulphide, gr. ½ ; Turpentine, m. 5. These perles are hermetically closed gelatine envelopes, containing doses of various medicines. Being impervious to the enclosed substances, remedies of a nauseous nature may be administered by their means without either smell or taste being perceived by the patient ; and in addition to this they permit the exhibition, in a not too diluted form, of remedies which have either an irritating or corrosive action on the mucous membrane of the mouth and throat, or which suffer from exposure to the air. The perles are absolutely tasteless, and dissolve readily in water or in the stomach.

Goa Powder.—This body has the reputation of being a specific in certain cutaneous affections, as ringworm, &c. It is said to be the pith of the stem and branches of a tree called Araroba or Arariba, belonging to the order *Leguminosæ.* Considerable attention has recently been drawn to its active principle *Chrysophanic Acid*, as affording a more certain and elegant method of exhibiting this valued remedy. Goa powder is applied dissolved in vinegar, or as a pomade, the latter being preferable, especially if made with vaseline.

Acetum Pulveris Goæ.

Pomatum vel Unguentum Pulveris Goæ.

,, ,, ,, c. Vaselino.

Cachets de Pain (*Medicated Wafers*).—Under this name is introduced an ingenious device for facilitating the administration of medicated powders. The powder is enclosed between two hollowed discs of wafer-paper made to adhere at the edge. To take, the wafer is placed with a little water in a tablespoon, and is swallowed almost immediately. In this way most nauseous drugs may be administered without the patient being conscious of it ; and remedies which suffer by exposure, such as reduced iron, the saccharated carbonate of iron, &c., are effectually preserved. By interposing a flat disc of wafer-paper between the two hollow ones, it is possible to administer at the same time two substances which shall decompose in the stomach and give rise to a third substance in the nascent condition. Corbyn, Stacey, and Co. have recently introduced a simple and inexpensive apparatus by which the *Cachets* are easily filled and closed, so that powders may be dispensed in them with almost as great facility as in the ordinary way.

All their specimens were of an excellent character, and well worthy of their high reputation.

John Richardson and Co., Leicester, also showed specimens of their soluble pearl-coated pills, and various other pharmacopœial remedies.

Leslie and Co., T. H. Smith, J. W. King, Symes and Co., Woolley and Co., Chapman and Co., Harvy Reynolds and Co., Brady and Martin were also represented.

Brand and Co.'s articles of diet for invalids, as their essence of beef, chicken, turtle-soup and jelly, meat lozenges, were also shown.

EXHIBITION OF SANITARY APPLIANCES.

The practical appliances used in connection with sanitary science find a tolerably complete representation in the Exhibition, held under the auspices of the Manchester and Salford Sanitary Association. The term "sanitary appliances," however, as used in this connection, requires to be liberally construed, including as it does such widely different articles as sanitary literature, patent coffins and funeral cars, models of crematory apparatus, machines for manipulating food, vessels for preserving liquids, hospital bedsteads, patent flour and bread, easy-fitting knapsacks, baths, comparative samples of pure and adulterated food, automatic stoking machines, smoke curers, damp bed detectors, disinfecting fluids and compositions, gas-making machines, filters, engines, disinfecting and clothes-drying closets and stoves, Archimedian screw ventilators, fuel-economising fireplaces, double-faced firegrates, washing machines, Abyssinian tube wells, cooking stoves, pumps, machines for testing the strength of Portland cement, patent paints and petrifying liquids, specimens of terra cotta, floorcloth, ashtubs, stench traps, cinder sifters, patent closets, diagrams and models of rival drainage systems, manhole covers and frames, manufactured manure, samples of sifted cinders, ash-dust and other refuse, disinfecting apparatus, and a host of other articles. Some of the machinery is kept in motion by means of steam-engines which one or two of the exhibitors have themselves provided. Several persons have contributed unpatented inventions, under the protection of the certificate which the Board of Trade—regarding the exhibition as, "in their judgment, calculated to promote British industry and to prove beneficial to the industrious classes of Her Majesty's subjects"—have granted. By virtue of this certificate all unpatented inventions shown in the Exhibition are protected from piracy during the ensuing six months, and if the owners patent them at any time in the course of that period they will be in as safe a position as if they had obtained legal protection for their ideas before making them known at the present Exhibition.

The Exhibition is divided into seven sections, the whole of which are contained in the Coupland Street structure

with the exception of the department of sanitary literature, which has been placed in the Medical School.

The first section did not present anything of special interest.

Section 2 is devoted to sanitary achitecture and building. Many Manchester people, having still the controversy respecting the condition of the Royal Infirmary ringing in their ears, will look with interest upon three designs for hospital construction. One of these is contributed by Mr. H. Greenway (Plymouth), while the remaining two—which are respectively described as "Design for a Town Hospital" and "Drawings of a Village Hospital at Mansfield, Woodhouse"—are the work of Messrs. Corbett, Sons, and Brooke (Manchester).

Water supply, ventilation, disinfection, heating, and lighting form the subjects of exhibition in section 3, which is by far the most numerous, numbering 145 exhibits. In this department Messrs. Thomas and Taylor and Messrs. T. Bradford and Company (Manchester) have machinery in motion for the purpose of working their respective productions, which consist of disinfecting apparatus, drying stoves, washing machines, &c. A great variety of disinfecting fluids, soaps, ventilators, and filters find a place in this class.

Section 4 nominally comprises apparatus for smoke consuming and methods for the purification of polluted rivers; but the latter are conspicuously absent, and of the former there is not a large show. The principal exhibitors are Messrs. Johnson and Hobbs and Mr. J. K. Broadbent, of Manchester; the Chadderton Ironworks Company, Limited; Mr. J. D. Wright (London), and the Patent Diagonal Rocking Fire Bar Company (London).

The next department comes under the head of food, clothing, and personal conveniences. The inventions of Messrs. F. and C. Hancock (Dudley) for washing and cooling butter, crumbling bread, and sugar grinding, and for mixing powders, merit the attention of housewives and also of grocers and druggists. Mr. C. Estcourt, public analyst of Manchester, contributes an interesting collection of samples of food in their pure and adulterated states. A number of hospital beds, baths, refrigerators, &c., are included in this section.

The subjects of funeral reform (recently noticed in the Medical Press and Circular) and disposal of the dead are respectively illustrated by Messrs. S. Hatchard and Co. (London) and the London Necropolis Company. The former contribute a "duplex" funeral car, which can be drawn by either men or horses, will permit the coffin to be plainly seen if desired, is simple and unostentatious in appearance. and calculated to effect a saving in the cost of funerals. The Necropolis Company show a couple of Mr. Seymour Haden's "earth to earth" coffins, made of paper, their advantages being stoutness aboveground and rapid decomposition when in the earth. The company have adopted them in place of the wickerwork coffins that were much commented upon some time ago.

The Ladies' Sanitary Association (London), which is doing good work among the poor of the metropolis, exhibit a collection of their books and tracts, in which they present the truths of sanitary science in literary forms, intended to attract the attention of those who may not be sufficiently alive to the value of sanitary knowledge.

The collection of sanitary literature is somewhat meagre, and can by no means have realised the anticipations of the promoters. The press should be a powerful and useful element in spreading sanitary knowledge, in educating the public in the duties of citizenship, in assisting in the prevention of contagious and infectious diseases, and in teaching how this might be done.

MICROSCOPES AND MICROSCOPIC SPECIMENS.

There was an average number of exhibitors in this class, amongst whom we noticed Armstrong Bros., Dancer, Wasserlein, Berlin, Pillischer, S. and J. Beck, Swift, &c.

Amongst the specimens particularly worthy of attention were those of Dr. Braidwood, Birkenhead, showing human, variolous skin, scarlatinal skin, and skin in measles; those of Prof. Charcot (a series of microscopic sections illustrating diseases of the nervous system), of Dr. Gower, London, and specimens by Drs. G. and F. Hoggan.

PHOTOGRAPHS, DRAWINGS, ETC.

Dr. Tilbury Fox exhibited illustrations of cutaneous eruptions, as erythema, urticaria, pellagra, impetigo, pemphigus, psoriasis, scabies, tinea; and Dr. H. MacNaughton Jones, Cork, had also some original aural drawings from Nature, executed under his own personal superintendence and inspection, by Miss M. Boole, Clinical Assistant, Cork Ophthalmic and Aural Hospital.

Literature.

HEADACHES. (a)

There are few practitioners, who in the course of their practice have not been baffled in the treatment of this troublesome and often very obstinate complaint. Nor is it for lack of experience that they so frequently fail to remove or relieve a symptom, which is in nine cases out of ten far more painful and unbearable than many more serious affections. It is rather because they are unable to recognise in each individual case, the true cause and pathology of the headache, and therefore, to lay down correct principles of treatment, and to persevere in the use of those therapeutic agents, which such principles suggest. We therefore think this little work will supply a want that must have been long felt by the busy general practitioner, who, in his capacity of family medical attendant, is more frequently called upon to treat this troblesome affection than any other class of medical men. One advantage of this work is that it takes into consideration the results of the valuable researches that have been recently made into the physiology and pathology of the brain. For example, "The recognition of perivascular spaces has enabled us to comprehend how the blood supply of the brain may vary from time to time . . . By means of these spaces the vessels dilate without compressing the brain, and when they again contract the soft structures of the brain are sustained by the effusion of lymph without any serious consequence ensuing." Not that we wish the reader to suppose that it is merely a theoretical work. On the contrary, the views advanced by the author are the results of notes and observations carefully recorded by him, and extending over a period of many years. He has, moreover, rather relied on the investigation of facts, as presented by the record of cases, than trusted to plausible theories.

The work is divided into sixteen chapters, every one of which is devoted to the consideration of a particular form of headache. This may at first sight seem unnecessary refinement; but considering the various conditions which may give rise to headache, we do not, with one or two exceptions, think he could have adopted a more simple classification, especially as the majority of the forms described have been long recognised as perfectly distinct in their nature, and as requiring very different and sometimes opposite kind of treatment. Perhaps, however, the distinction made between, and the devotion of separate chapters to the consideration of, the headache of "cerebral congestion," the headache of "cerebral hyperæmia," and that arising from "plethora and increased vascular action," may be open to objection. The distinction is apt to create a little confusion in the mind, both as to the pathology and diagnosis of these varieties of headache; more particularly as their respective nature and symptoms are not described with that clearness and precision which could enable the reader to recognise such distinctions in practice. Nevertheless, this is the only fault we see in a book which is otherwise the best we have yet read on the subject. The chapters "In Sympathetic Headache," "On Nervous Headache" and that "On Headaches of Childhood and Early Life" are particularly worthy of attention. It is moreover, one of those works that will be found very useful

(a) "Headaches: their Nature, Causes, and Treatment." By William Henry Day, M.D., Lond. J. and A. Churchill. 1877.

to the young practitioner, fresh from the hospitals, and who is very likely to fall in the estimation of his patients, especially his female patients, if he is ignorant of the nature and management of this troublesome complaint.

"Castor-Oil" Pills.

A DRUGGIST was prosecuted last week for selling a preparation under this name, which "was not of the nature, substance, and quality," asked for. The certificate of the county analyst which was put in, stated that the sample of pills contained rhubarb, aloes, peppermint, oil, and soap, and that the application of the term castor-oil to these pills was a dangerous practice, and might be attended with injurious results by leading the purchaser to understand that the active ingredient of the pills was castor-oil.

The defendant's counsel pleaded that these pills, however wrongly called, were not sold to the prejudice of the purchaser. He said the pills in question were very much more valuable than pills made of castor-oil would be; for only one grain of castor-oil should be contained in one pill, so that it would take from 200 to 400 pills for one dose. Therefore it had been the custom for 25 or 30 years to sell such pills as those in question as "castor-oil" pills.

The chairman said he believed it had been decided in a tea case that the purchaser was entitled to have what he asked for, and that if the vendor could not supply him, he had a right to be told so.

There were many articles sold by chemists which were called by names not properly applicable to them, and if the bench convicted in this case—

The Chairman:—You would have to call a spade a spade.

Counsel went on to say that there was, for instance, "sweet spirits of nitre," which contained no nitre.

In delivering the decision of the bench, the chairman said the evidence which had been given for the defence did not touch the fact that Mr. White had asked for one thing and been served with another, but the evidence adduced had shown the existence of a custom in the trade which they admitted as evidence in mitigation. It was a singular custom, however, and the sooner it was left off the better. It would be much better when the public asked for castor-oil pills to tell them, "There are no such pills in the trade, but we can give you something which will answer the purpose as well." At all events the intention of the Act was perfectly clear—to give the public a right to have what they ask for or be told that they could not get it. Fined 1s., and 19s. 6d. costs.

The decision seems to us a most just and sensible one. We repeat that it is no argument whatever to say that the pills are better than those asked for. The customer is presumed to judge of that when he asks for them. Nor is it any argument to compare the title of such an article with "devil's drug," dragon's blood, or such-like misnomers. The essence of the offence is the deception. In the case of these articles there is no deception, but in the case of the pills there is, and moreover, is intended to be.

Army Medical Service.—The Director-General of the Army Medical Department presents his compliments to the Editor of the MEDICAL PRESS AND CIRCULAR, and begs to enclose a list of candidates of Her Majesty's British Medical Service who were successful at the examination in London in February, 1877, and who passed through a course of instruction at the Army Medical School, Netley, August, 1877:—

Mullen, J. J. ...	5,718	Kenny, W. W. ...	3,895
Murphy, F. H. S.	5,098	Ellis, P. M. ...	3,772
Johnston, W. T. ...	4,656	O'Sullivan, J. P. ...	3,758
De Caux, F. ...	4,595	Hogan, E. M. A. ...	3,671
Browne, A. W. ...	4,193	Irwin, A. ...	3,310
Hodson, R. D. ...	4,138	Kearney, T. ...	3,193
Powell, C. K. ...	4,075	McCarthy, W. ...	2,831
Kirkpatrick, H. C.	4,038	Brodie, J. F. ...	2,773
Armstrong, J. ...	3,970		

Medical News.

University of London.—The following gentlemen passed the first M.B. examination at meetings of the examiners last week:—

First Division.

Banks, Wm., University Coll.	Neale, Wm. H., University Coll.
Castle, Hutton, St. Thomas's Hos.	Paddle, J. I., B.A., B.Sc., University College.
Dalton, Norman, King's Coll.	Penny, Edward, Guy's Hospital.
Forsbrook, W. H. Russell, Westminster Hospital.	Pollard, Bilton, University Coll.
Franklin, A., St. Barthol. Hosp.	Pughe, T. W. O., Liverpool R. Infirm. & Guys Hospital.
Gill, R., St. Bartholomew's Hosp.	Rushworth, F., St. Barth. Hosp.
Gotch, F., B.A., B.Sc., Univ. Coll.	Sainsbury, H., University Coll.
Haylard, R., Leeds Sch. Medicine.	Smith, R. P., St. Thomas's Hosp.
Hine, John E., University Coll.	Wooldridge, L. C., Guy's Hosp.
Malyard, Alfred E., Guy's Hosp.	
Money, Angell, University Coll.	

Second Division.

Balls, James, King's College.	Hayward, J. D., L'pool. R. Infirm.
Barling, G. H., St. Barthol Hosp.	Hodgson, John, Owens College.
Buckell, Arthur E., Univ. Coll.	Jackson, Arthur, St. Barth. Hosp.
Chaffey, W. C., S. Barth. Hosp.	Keep, Chas. Henry, Guy's Hosp.
Colquhoun, D., Charing Cross Hos.	Macdonald, G. M., King's Coll.
Davies, D. S., St. Thomas's Hosp.	Michael, H. J., St. Thomas's Hos.
Edwards, W. W., St. Mary's Hosp.	Outhwaite, Wm., St. Barth. Hos.
Fuller, Thos. W., Guy's Hospital.	Ponsford, L. C., University Coll.
Hartley, R. N., Leeds Sch. Med.	Rich, A. C., Liverpool R. Infirm.
Harvey, A., Queen's College, Birmingham.	Sayer, M. F., University Coll.
Hayle, T. Hahnemann, Owens Coll.	Walton, Robert S., Univ. Coll.
	White, Wm. Hale, Guy's Hosp.

Excluding Physiology—First Division.

Crisp, Thos., St. Thomas's Hosp.	Suckling, C. W., Queen's College, Birmingham.

Second Division.

Burry, H. B. P., London Hosp. and University College.	Fooks, George. E., St. Barth. Hos.
	Herschell, G. A., St. Thomas's Hos.

Physiology—First Division.

Beevor, Charles E., Univ. Coll.	Meek, John W., Guy's Hospital.
Lowe. H. G., Queen's College, Birmingham.	

Second Division.

Barker. F. R., St. Thomas's. Hos.	Vinrace, J. H., Queen's College, Birmingham.
Shaw, George, Westminster Hosp.	Williams, Dawson, Univ. College.

Royal College of Surgeons of England.—The following gentlemen, having passed the required examination, were admitted members of the College at a meeting of the Court of Examiners on Aug. 2nd:—

Birdwood, Roger A., Bombay.	Langdon, J. W., L.S.A., Chester.
Burgess, Wm. M., L.S.A. Harlesden.	Paddison, E. H., Bayswater.
Cardew, G. A., L.S.A. Cheltenham.	Poland, J. H., L.S.A., Blackheath.
Chubb, W. L., Torpoint, Cornwall.	Pope, C. E., Chilforme, Dorset.
Cobbin, W. I., Torrington Sq.	Prosser, T. G., L.S.A., Monmouth.
Davy, H., Ottery St. Mary, Devon.	Smyth, A. C. B., L.R.C.P., Edin., Dublin.
Gardner, J. T., Ilfracombe, Devon.	White, R. G., L.S.A., Chinkiang, China.
Hall, C. R., L.R.C.P. Edin., Tottenham.	

Royal College of Physicians and Surgeons, Edinburgh.—DOUBLE QUALIFICATION.—The following gentlemen passed their final examinations and were admitted L.R.C.P. Edin. and L.R.C.S. Edin. during the recent sittings of the Examiners:—

Baxter, Edward J., Middlesex.	Mackenzie, W. Gillespie, Belfast.
Balmanya, Antonio, Cuba.	Maxton, Laurence, Calcutta.
Brannigan, Henry C., co. Mayo.	Macnaughton, John, Glasgow.
Campbell, Peter, Crieff.	Murray, Hugh, Bonar Bridge.
Crane, Alfred Wyatt, France.	Miller, Alfred H., Rochester.
Durand, Rudolphe, Mauritius.	Macgregor, Peter, Perthshire.
Dedrickson. Robert F., Dublin.	Naismith, Fergus C., Bengal.
Glaister, John, Lanark.	Noad, Hartley L., Herne Hill.
Graham, Andrew, Forfarshire.	Reckitt, John D., Thorpe, Hull.
Greasley, J., Melton Mowbray.	Tait, Richard A., Exemouth.
Howard, J. A., Bagborough.	Vanes, Arthur B., Worcestershire.
Hartley, Harrison, New Malton.	Walker, Henry B., Nenagh.
Jenkinson, Alfred S., Yorkshire.	

Royal College of Surgeons, Edinburgh.—The following gentlemen passed their final examination, and were admitted Licentiates of the College during the recent sittings of the Examiners:—

Baldwin, E., St. George, Toronto.	Lauder, W., Port Glasgow.
Croudace, James H., Durham.	Mickle, A. W. T. F., Yorkshire.
Duncan, George, Perthshire.	M'Nicoll, E. D., Liverpool.
Gordon, Richard, co. Sligo.	Nariman, Haikhosro S., Surat.
Heornlé, Edward F., India.	Norcop, Percy G. H., Plymouth.
Hodgson, Wm. B., Middlesex.	Parker, James, India.
Holmes, David, Malta.	Reporter, M. E., Amrolee, Surat.
Jervis, Henry P., Bombay.	Smith, J. A. J., Stornoway.
Kambata, Hiraja J., Bombay.	Smyth, Albert, C. B., Dublin.
Koyaji, Beramji N., Bombay.	

NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in London, Dublin, or Edinburgh.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

IN consequence of the pressure on our space, caused by our Report of the Proceedings of the British Medical Association, we are compelled to hold over several Original Communications, Clinical Records, Reviews, Correspondence, &c.

DR. DE LISLE ALLEN FUND.

THE Hon. Treasurer, Dr. B. W. Richardson, Hinde Street, London, W., begs to announce the following additional subscriptions to the above-named Fund received since our last notice:—

	£	s.	d.
Coates, C., Esq., M.D., Bath	2	2	0
Hill, Berkeley, Esq., London	2	2	0
Page, W. B., Esq., Carlisle..	2	2	0
Stephens, W., Esq., Finchley	5	5	0
Whitelaw, W., Esq., M.D., Kirkintilloch ..	0	10	6

Mrs. Allen begs us also to acknowledge, with many thanks, the following made to her before the formation of the Fund:—

	£	s.	d.
Clarke, Andrew, Esq., M.D., London ..	2	2	0
Critchett, G., Esq., London	1	1	0
Hawkins, Cæsar, Esq., F.R.S., London ..	2	2	0
Henston, G., the Rev., London	3	0	0
Ogle, J., Esq., M.D., London	1	0	0
Paget, Sir James, Bart., F.R.S., London ..	2	2	0
Smith, Thomas, Esq., F.R.C.S., London ..	5	5	0

SCARCE NUMBERS.—Correspondents are requested not to send any more of the numbers advertised for in our number for August 1st at double price, as we have received as many as we require.

DR. FAUSSETT.—The letter and enclosure has been forwarded to Paris. As the committee is not now sitting it is probable there may be some delay.

VOLUNTEER SURGEON.—There can be no doubt a body of trained men accustomed to the work of carrying the wounded might be of great service in cases of fire and accidents. We trust they will never be required for active service.

M.D., London.—Our views on the M.D. question are, we believe, logical.

CEREBRUM.—You will find an excellent translation of "Charcot" in our columns of this year. French writers have devoted more attention to this subject in its practical bearings on the use of the trephine. The question is still *sub judice*.

DR J. H., Sheffield.—The communication referred to in your note had not come to hand when we went to press.

INSURANCE, Yorkshire.—It is difficult always to make provision for a family. You should continue your insurance and also join one of the Medical Benevolent Societies; we believe there is one in the West Riding, of which Dr. Chadwick is secretary.

MR. FORSTER.—The object of your inquiry died in January last; you will see a short obituary notice in our columns.

A FRIEND.—We have to thank you for your hints. Of course, every one thinks he could edit a paper better than the editor, that is one of the weaknesses of human nature, and is a recognised form of disease in the literary world. You forget you are only a unit amongst thousands of readers, and we have to consider their views. We must necessarily be Benthamites and go in for the "greatest happiness of the greatest number."

DR. GREGORY SALE is thanked.

ASSISTANT.—Consult our advertisement columns. We have consistently refused the insertion of advertisements for unqualified assistants, and shall continue to do so.

THE RESULTS OF LEGISLATION BY AGITATION.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—In your number for August 1st, p. 93, you speak of "The Women's Vigilance Society." I think there is no society of that name. There is the "Vigilance Association;" but I notice that there are more gentlemen than ladies upon its executive committee. I much approve the object of this Association when I see Acts of Parliament paring away our personal liberties.

In the same paragraph you refer to the "Anti-Contagious Diseases (Women) Act Society," and you again speak of it as if it was composed only of women, which is not the fact. I have long supported it. A respectable tradesmen here said the other day—"Upon no consideration whatever would he vote for any member of Parliament who could not promise to vote for the repeal of the Contagious Diseases Act." Another, who had lived in Woolwich, a subjected town, said, "He felt the deepest indignation whenever the Contagious Diseases (Women) Acts were mentioned."

I have an object now in going to Dover, but I shall probably avoid going with my family to a town where liberty of person is no longer secured equally to men and to women.

I am, yours obediently,

Epping, Essex. DUNCAN R. MCNAB, M.R.C.S.E.

[*** Our correspondent need not be under the slightest apprehension of the personal safety and liberty of his family at Dover. An authenticated case of interference with the liberty of the subject—the demi-monde excepted—in any protected town in this country has never yet occurred, nor is likely to occur amongst well-conducted persons. It is not for our correspondent's class that vigilance committees are necessary, but rather for those with whom we, as public journalists can have little sympathy.—ED.]

WE have heard of a London music-hall comic singer who utilised his wife's tombstone in Kensal Green as an advertisement of his own popularity and attainments, but we have never until now known of a land auction being turned to account as a puff. The following appears as an advertisement in the Dublin papers:—

SALE BY AUCTION.

MESSRS. GAMMON, SONS, & PARTNER are favoured with the confidence of the representatives of the late —— to sell the above splendid affair of 80 Irish acres. The proprietor, Dr. ——, being a professional gentleman in high practice, would not divide his energies by looking to farming, will sell *bona fide*, his object being to prosecute to the end his peofession, *that has proved already a success in the neighbourhood of the mercantile and wealthy city of Drogheda.*

The eloquence of auctioneers is proverbial and inexpressible, but it hardly seems to us that the "success" of the learned owner's "high practice" in the neighbourhood adds much to the turnip-growing value of his land, or that money expended in advertising that fact yields much return, unless, indeed, in the way of medical trade.

BOOKS, PAMPHLETS, AND MEDICAL JOURNALS RECEIVED.

VACANCIES.

Dental Hospital of London.—Medical Tutor in the Dental School, and Demonstrator of Dental Operations in the Hospital. Salary, £100 attached to each office. (See Advt.)

Royal Free Hospital, Gray's Inn Road, W.C.—Assistant Physician and Assistant Surgeon. Honorary. Testimonials to Mr. Blyth, Secretary, on or before Sept. 1.

South Yorkshire Lunatic Asylum.—Assistant Medical Officer. Salary, £100, with board and apartments. Address Dr. Mitchell, Wadsley, near Sheffield.

Wilts County Lunatic Asylum.—Assistant Medical Officer. Salary, £110, with board. Applications to the Clerk of the Visitors, Devizes.

Liverpool Dispensaries.—Assistant House Surgeon. Salary commencing at £108 per annum. Applications to the Secretary, 34 Moorfields, Liverpool.

Isle of Wight Union.—Medical Officer. Salary, £90, with the usual extra fees. Applications to the Clerk of the Guardians, Newport.

Cavan Union, Ballananagh Dispensary.—Medical Officer. Salary, £100 per annum. Election, 18th inst.

Killala Union Workhouse.—Medical Officer. Salary, £50. Election, Sept. 1.

Killala Union, Killala Dispensary.—Medical Officer. Salary, £80. Election, Sept. 1.

Queenstown Dispensary.—Resident Apothecary. Salary, £70 per annum, with perquisites amounting to £45.

Marriage.

WOOD—HENRY.—August 7, at Holy Trinity Church, Roehampton, William Edward Ramsden Wood, M.A., M.B., eldest son of William Wood, M.D., of Harley Street, and The Priory, Roehampton, to Alice Louisa, youngest daughter of James Henry, Esq., of Blackdown, Sussex, formerly of the 72nd Highlanders.

Deaths.

BROADBENT.—On Aug. 5, at East Gate, Lincoln, Edward Farr Broadbent, F.P.C.S.E., aged 63.

HANDY.—On July 28, at Killala, Samuel Wesley Handy, L.K.Q.C.P.I., aged 37.

LAWTON.—On July 4, at Rochdale, James Lawton, M.R.C.S.E., aged 63.

MAY.—On August 7, at his residence, Bruce Grove, Tottenham, Edward Curtis May, F.R.C.S., aged 80.

SIMPSON.—On July 30, at Alphington, Devon, William Simpson, Surgeon, aged 76.

OBSERVATIONS ON SOME POINTS IN THE PATHOLOGY OF SYPHILIS.

By James R. Lane, F.R.C.S.,

Surgeon to St. Mary's Hospital; Consulting Surgeon to the Lock Hospital.

ON VACCINO-LYMPH.

I have recently alluded to the contagious quality of the blood of syphilitic persons, and in connection with this comes the interesting question of vaccino-syphilis. The reality of the communication of syphilis by impure vaccine-lymph has been only too clearly proved, and the opinion generally held is, that it has depended upon the accidental admixture of blood with the lymph employed. Cases of this kind are extremely rare, and have fortunately till lately been almost unknown in this country; at all events, if they have occurred, they have not been made sufficiently public to awaken the profession to a sense of the danger until Mr. Hutchinson, in 1871 and 1873, communicated to the Medico-Chirurgical Society the history of some remarkable groups of cases.

There were some who blamed Mr. Hutchinson at the time for making these cases public, but he wisely deemed it better that the knowledge of such a danger should be diffused as promptly and widely as possible. The profession in England had till then been incredulous on the point, and a full knowledge of the risk was clearly the first step towards preventing the occurrence of such lamentable accidents in the future.

It appears to me to be of the greatest importance at the present time that the true state of the case should be appreciated as accurately, both by the profession and by the public, as the state of our knowledge admits, in order on the one hand, to counteract the exaggerated and mischievous statements of the opponents of vaccination; and, on the other hand, to guard against a tendency to ignore or to make light of the danger, which has, I think, been apparent in some influential quarters. The risk seems to have been suspected long ago, for Lancereaux states that attention was drawn to it in 1805 by an English surgeon named Moseley. In 1814, an Italian surgeon named Marcolini records as follows: A little girl born of syphilitic parents served for the vaccination of ten children; from these thirty others were vaccinated, making forty in all. The whole number are said to have had syphilis, and several died. Other examples of this kind appear to have cropped up at intervals in different parts of the Continent, including the well-known one at Lupara, in Naples, in 1856, when thirty-four children contracted disease, and were the means of conveying it to a number of other persons. But, in spite of these facts, the possibility of this mode of infection was hardly admitted till 1860, when Dr. Viennois, of Lyons, published a work on the subject; and he, after examining all the cases recorded, came to the conclusion that it was the blood, and not the vaccine lymph, which conveyed the disease. Soon after—in 1861—the celebrated Rivalta case occurred, where the same lymph served in succession for the vaccination of sixty-four children, of whom forty-six were infected, and conveyed the disease to twenty of the mothers and nurses. Several of the children died. It is a curious coincidence that all these severe outbreaks of vaccino-syphilis should have happened in Italy, and in country villages rather than in large towns.

Lancereaux collected 351 cases in which vaccination was performed with lymph which appears to have been impregnated with syphilis. Of the 351, 258 contracted syphilis, while 93 only escaped.

Since Lancereaux's work was published, we are indebted to Mr. Hutchinson for his series of cases, which are recorded by him in his usual careful and complete manner. In the first series in 1871, twelve persons, mostly young adults, were vaccinated from an apparently healthy child, but which soon afterwards showed evident signs of constitutional syphilis. In all twelve the vaccination progressed satisfactorily, but in ten indurated chancres were developed at the seat of the punctures by the eighth week. All were treated with mercury, and in all the primary sores quickly disappeared, but in four of them constitutional symptoms appeared five months after the vaccination. There is reason to believe that blood was mixed

with the lymph in these cases. Mr. Hutchinson's second series occurred in May, 1871. The vaccinifer was a child in good health and condition, but with slight local symptoms of inherited syphilis. Twenty-six persons had been vaccinated at the same time from this child. Out of the twenty-six there were unmistakable symptoms of secondary syphilis in nine, all children, suspicious symptoms in six others, and entire escape, as far as was known, of the remainder. Mr. Hutchinson published two other cases, which I need not detail, but will merely observe that in them, as in the second series mentioned, there was no evidence that the lymph was contaminated with blood.

It seems clear, then, that cow-pox and syphilis can be conveyed simultaneously by inoculation. When this takes place, the two diseases are developed independently and without interfering the one with the other, and there is a singular uniformity in the course which they are found to follow. The vaccine vesicles are developed as usual, but at the end of a month or five weeks, and usually not till after they have healed, a chancrous induration appears at one or more of the inoculated points, and a few weeks later the ordinary train of secondary affections follows. Or the result, as regards vaccination, may be negative, as it so often is in re-vaccination ; the punctures heal and are forgotten, but after the usual interval the syphilitic symptoms make their appearance.

I have referred to the prevalent opinion that it is the blood, and not the vaccine lymph, which conveys the contagion—a view which seems to be strengthened by the fact that Rollet and others have vaccinated with lymph from syphilitic children, carefully avoiding any admixture of blood, and the result, as regards syphilis, has hitherto been negative. Such negative results, however, are quite inconclusive ; for, even with syphilitic blood, carefully inoculated on purpose, the failures have been in the proportion of about three in every four attempts. The question is,—Can we be certain that the admixture of blood is necessary? Mr. Hutchinson thinks that probably it is not, but he evidently thinks that it greatly increases the risk, for he suggests that if the vaccine vesicle be drained too freely, corpuscular elements of the blood and tissues may readily become mixed with the lymph, and that this mixture may account for some persons becoming infected while others vaccinated from the same source escape. This, however, is hardly more than an hypothesis, and the only safeguard we have is to inquire carefully into the antecedents and present condition of every child before vaccinating, and if there is the slightest doubt attaching to its history, to reject it as ineligible. It is clearly proved that syphilitic blood may convey syphilis, but it is not yet proved that vaccine lymph from a syphilitic child, however carefully taken, will not have the same effect, and it would therefore be the height of imprudence to act on any such belief.

Mr. Hutchinson's cases are all examples of direct communication from a diseased child to those vaccinated from it, and this is a mode of transfer which one's mind readily admits ; but it is very difficult to conceive that healthy persons so inoculated, when made use of a week afterwards to vaccinate others, and long before they have themselves developed any syphilitic symptoms, should be equally capable of conveying that disease, as is stated to have happened in most of the continental groups of cases. Can it be possible that a syphilitic inoculation which does not affect the system sufficiently to produce even a local result in the form of a primary sore for five or six weeks, and no general result till some weeks later, should in one week have so contaminated the whole mass of the blood as to render it, or its products, inoculable at the end of that short time? This would imply a general and thorough infection of the system in the early part of the incubation period—a view in the pathology of syphilis which, as far as I know, has never yet been suggested.

It is so extremely unlikely that, for myself, I cannot accept the facts as authentic without much fuller and more rigorous investigation. If it were true the prospect would be indeed alarming. It would be useless to inquire into the health of a child before vaccinating from it, for it might have been infected by vaccination from a syphilitic child a week before, in which case it would appear perfectly healthy, and would not present any outward sign of syphilis till four or five weeks later. It would, in fact, be necessary to search back through a series of five or six consecutive vaccinations before any certainty of safety could be attained. If the disease were really capable of being conveyed in this manner in geometrical progression, vaccine syphilis would surely have been the rule amongst us by this time, instead of being the very rare exception, which we know it so fortunately is. There would then be nothing for it but constant recurrence to the cow—an expedient which might probably be resorted to with advantage much more frequently than it is.

If proper precautions are taken in the selection of the children from whom the lymph is procured I believe the chance of the communication of syphilis by vaccination to be so small that, though it should never be lost sight of, it should not be allowed to weigh in the balance for one moment against the thousands of lives which are annually saved, and the many more thousands of persons who escape mutilation and disfigurement through the beneficent influence of Jenner's great discovery.

CONTAGION OF THE SECRETIONS OF SYPHILITIC PATIENTS.

The question of the contagious property of the secretions of syphilitic poisons, such as the pus of an ordinary abscess, the morbid secretions of mucous membranes, the pustules of acne, the serum of eczema, &c., is analogous to that of unmixed vaccine lymph. The matter of acne and of eczema from syphilitic patients has been inoculated by Diday on healthy persons, but with no effect, and the tendency has been to consider all such secretions as harmless, or, at least, that the contrary is not proven. Lately, however, in 1870, the late Mr. Morgan, then surgeon to the Westmoreland Lock Hospital, Dublin, related some experiments which favour the opposite conclusion. He performed a number of inoculations with the matter of purulent vaginal discharge. When the discharge proceeded from a patient free from syphilitic taint, the result was negative, but when it was taken from a patient with secondary disease, the effect was the production of an ulcer, exactly resembling a soft chancre, and, like it, reinoculable. He was careful to ascertain by examination, externally and through the speculum, that no ulceration, either primary or secondary, coexisted with the discharge. His experiments were performed either on the patients themselves or on others who were syphilitic ; he did not, of course, feel justified in inoculating healthy persons. The result was exactly what has been found to happen when the matter of hard sores or of secondary affections has been inoculated on syphilitic patients, and there is good reason to suppose, therefore, that the purulent discharges from syphilitic patients are charged with syphilitic infection, and might convey it to an untainted person. This would explain the result of Hunter's inoculation of himself, and also those exceptional cases in which syphilis is apparently the result of gonorrhœa.

Next, as to the physiological secretions of syphilitic persons—the tears, the saliva, the perspiration, the semen, and the milk. The balance of opinion is against their contagious quality, always supposing them to be unmixed with the products of any secondary lesion. Inoculation with the first three—namely, saliva, tears, and perspiration—has been tried, and has hitherto failed. I do not know that the inoculation of semen has been tried, but I believe there is no instance in which, when the male organs were free from disease, the semen of a syphilitic patient has infected a female in the usual way by the production of an indurated sore. But there is another way in which the semen may possibly convey disease. There are some who think that an infected man, cohabiting habitually with the same woman, may develope a secondary infection in her by the gradual absorption of the elements of the contaminated seminal secretion into her circulation, without the intervention of pregnancy, or any

kind of primary lesion. The late Mr. Porter, of Dublin, and the late Mr. Langston Parker have recorded cases in favour of this view, which is supported also by Mr. S. Lane. All these are authorities whose opinion deserves attention, and the point is one well worth further consideration. The difficulty in all these cases is, that the woman may at some time during the cohabitation have had an indurated sore, which caused her so little inconvenience as to remain unnoticed.

With respect to the milk, it is generally believed that a healthy child suckled by a diseased nurse will not contract disease unless the nurse has some secondary lesion on the nipple or in its neighbourhood; that the milk itself, in fact, does not convey the disease. It is possible, however, that the diseased milk, if the child's mouth or lips were abraded, might communicate infection, although under the opposite circumstances it would be passed into the stomach without causing any mischief in its transit, and then be so changed by the action of the gastric fluid as to lose its contagious quality. Some experiments do, in fact, throw doubt on the innocuity of this secretion. M. Voss, of St. Petersburgh, has recently inoculated three prostitutes with milk from a syphilitic woman. The milk was injected subcutaneously with a syringe. One of these women was already syphilitic; in her no result was obtained. In another, whose condition as to previous syphilis was doubtful, the result was also negative; but in the third, a girl, aged 16, who had never had syphilis, papular spots appeared around the inoculated point forty days afterwards, and were soon followed by a general syphilitic eruption.

I do not pretend to offer a decided opinion on the various uncertain points; but I see no reason why secretions, whether natural or morbid, which are formed from diseased blood, should not partake of the contagious quality of the fluid from which they are derived. At all events, the only safe course is to regard every one of them with profound distrust; and to take such precautionary measures, and to give such advice, as the circumstances seem to call for.

ABSTRACT OF REPORT OF THE ROTUNDA HOSPITALS FOR THE YEAR ENDING FIFTH NOVEMBER, 1876. (a).

By Lombe Atthill, M.D., Master of the Hospital.

Part II.—The Auxiliary Hospital for Diseases Peculiar to Women.

Classification of Cases.

	Cases.		Cases.
Abscess of breast	1	Leucorrhœa	4
Abscess of labium	3	Metritis (chronic)	8
Anteflexion	15	Menorrhagia	8
Amenorrhœa	5	Metrorrhagia	5
Cellulitis pelvic	12	Ovarian tumours	6
Cancer, medullary	5	Ovaritis	3
Cystitis	2	Pelvic tumours	5
Dysmenorrhœa	16	Polypus	8
Endometritis	32	Pleghmasia	1
Endocervicitis	11	Peritonitis	2
Epithelioma (of cervix)	5	Prolapsus uteri	3
,, (of vagina)	1	Prolapse of ovary	1
Eclampsia	1	Retained ovum	3
Fibroid tumours	9	Retroflexion	18
Fibro-cystic tumours	1	Subinvolution	9
Gonorrhœa	1	Vesico-vaginal fistula	4
Granular Erosion (of cervix)	9	Vaginitis	7
Hæmatocele (pelvic)	1	Vagina duplex	1
Incontinence of urine	1	Vaginal citrices	2

Dilatation of the uterus was carried out in 22 patients. The reasons which influenced us in so doing were various; in some the diagnosis of polypus, of retained ovum, or of granular endometritis, was previously made, but in about one-third of the number the operation was undertaken as a necessary step to enable us to decide on the nature of the case.

In three cases dilatation was practised for the removal of the products of conception. The following are the particulars of these cases:—

A. M., æt. 30, admitted 10th April, has had eight children, the youngest eighteen months old; nursed this child for eleven months; has been in bad health since its birth, suffering specially, since August last, from severe pain in her back, and *since Christmas has had a red discharge almost continuously*. Walking brings on violent bearing-down pains. She was, on admission, in a very debilitated state, the discharge was copious, sanguineous, and fœtid. On making a vaginal examination the uterus was found to be much enlarged, the fundus was thrown forward; the os, which was patulous, being very far back.

The history of this patient's case negatived the idea of the existence of an intra-uterine polypus. I came to the conclusion that she had been pregnant, and that some portion of the ovum was retained. We introduced eight pieces of sea-tangle, for the purpose of dilating the uterus; the os being patulous and cervix relaxed, this was effected without difficulty. A very fœtid discharge escaped on withdrawing these, and before proceeding further it became necessary to syringe out the vagina and uterus with a disinfecting fluid; this brought away several large cheesy-looking masses, which, on subsequent examination, proved to be clots of blood, perfectly decolourised. On passing the finger into the uterus I detected the lower extremities of a fœtus. These were seized with the ovum forceps, and a fœtus of about the third month extracted, which, though macerated, was not in any way decomposed. Some trouble was experienced in removing the placenta from the fact of its being extremely friable, but with the aid of the ovum forceps it was all got away. Sharp hæmorrhage followed, which was checked by the injection of water. This patient made an excellent recovery.

M. C., admitted 18th September, 1876, had given birth to two children, the youngest of whom was eleven months old. She had suffered from uterine hæmorrhage almost without intermission since her last confinement, except during the months of June and July. For the last six weeks this discharge had been constant, sometimes very profuse, and she believed that she had aborted at or about the 1st August. On examination the uterus was found to be enlarged and globular, the cervix soft, and os patulous; being of opinion that some portion of the ovum must be retained, the uterus was dilated, and an ovum of about the 10th week removed.

The third case was that of M. M'M., æt. 25, admitted on the 10th September, suffering from profuse uterine hæmorrhage. She stated that three months previously, when eight weeks pregnant, she had a violent attack of hæmorrhage, and she believed then aborted. The present attack of hæmorrhage had lasted fourteen days. The hæmorrhage, on admission, was so profuse that the vagina had to be plugged; this arrested it. On making a vaginal examination the fundus of the uterus, much enlarged, was found to occupy the recto-vaginal *cul-de-sac*, the os being patulous; the uterus was dilated, and on passing the finger up to the fundus, a soft, spongy mass was detected. This was removed with the curette, and fuming nitric acid freely applied; the mass removed seemed to be a portion of placenta, much degenerated. This patient left the hospital quite well, in ten days.

Endo-metritis.—Dilatation was carried out in eight cases of endo-metritis, in which a granular condition of the intra-uterine mucous membrane existed.

Division of the Cervix Uteri.—This operation was performed five times. In each patient the prominent symptom was dysmenorrhœa; in three anteflexion was well marked, in all endo-metritis existed, and in each case where the operation was performed it was undertaken as the first step towards the cure of that affection, which was, in my opinion, the cause of the dysmenorrhœa. I believe it is seldom possible to cure chronic endo-metritis

(a) Read before the Dublin Obstetrical Society, June 16th, 1876

occurring in sterile women without having recourse to free division of the cervix.

Here is an outline of one of the cases :—

S. K., æt. 23, admitted 26th September, states that she had never been pregnant, that she began to menstruate at seventeen, without discomfort, and continued to do so till twelve months ago, when the function became painful, and the discharge very scanty, lasting but one day instead of three ; suffers at each recurrence of the period from nausea, and sometimes actually vomits ; describes the pain as "agonising."

On a vaginal and bi-manual examination the uterus was found to be acutely anteflected, the os was patulous, the passage of the sound, and specially pressure of the point against the fundus, causing great pain ; a copious glairy discharge issued from the os. Diagnosis, endo-metritis, supervening on congenital anteflexion.

28th September.—Cervix uteri divided posteriorly.

16th October.—Menstrual period over ; lasted four days. No pain.

9th November.—Has again menstruated, without pain ; flow lasted four days. Endo-metritis treated during the intra-menstrual period, by the application of carbolic acid to the interior of the uterus.

Amputation of the Cervix Uteri for epithelioma of that portion of the organ, was performed three times. In all of them the disease recurred.

Granular Ulceration of the Cervix.—Several cases of the severe form of this affection were admitted ; most of these had previously been treated in the Extern department without benefit, and in each of these, milder measures having failed, *Potassa fussa* was freely applied, in all with benefit. Our experience in the treatment of this affection is, that nitrate of silver, and even the fuming nitric acid, is insufficient for the cure of the severe forms of it, and that where the cervix uteri is soft and spongy and bleeds on being touched, it is necessary to destroy the whole vaginal aspect of the cervix to a considerable depth. Our custom is to leave in the vagina, after the application of the caustic, a pledget of cotton saturated in glycerine, which tends to lessen any pain or uneasiness which may follow the application. As a rule the slough separates in four or five days, leaving a healthy surface, which heals up in a short time. Our experience of this method of treating the affection under consideration is very favourable.

Double Vagina with Single Uterus.—A remarkable example of this rare affection was admitted in June last. The patient was a woman aged forty-three, who had been married for many years, but had never conceived ; menstruation had always been normal, and sexual intercourse neither difficult nor painful, till of late ; at the age of forty the catamenia ceased to appear, and not long after she began to suffer from pain in the left inguinal region. On examination a septum was found to run throughout the whole length of the vagina ; it extended over the cervix uteri, the os being situated in the anterior portion, and terminated just inside the labia minora ; the cervix conical, and the uterus small. The woman was suffering, on admission, from vaginitis, and it was for the relief of the sufferings due to this affection that she sought admission.

Believing that much of her sufferings were due to the existence of the septum, which, by narrowing the vagina, appeared to render intercourse painful, I divided it throughout its whole length ; the septum was dense, and, on being divided, retracted, forming a thick ridge on either wall of the vagina, laterally. Pledgets of cotton, saturated with glycerine, were then placed in the vagina, and she was discharged in a few days.

The most remarkable fact connected with this case is that for many years sexual intercourse appears to have been painless, while as life advanced, and the climacteric period approached, it became absolutely unbearable. I can only explain this by supposing that the septum became more dense as age advanced, and finally narrowed considerably the diameter of the vagina.

Fibrous Tumours of the Uterus.—The number of women the subjects of fibrous tumours presenting themselves at the dispensary or applying for admission into the auxillary hospital was very great. The great majority of these were cases not likely to be benefited by treatment, and consequently were not admitted. Nine were so, and were kept under treatment for periods varying from a week or two to several months. I have not space to enter into details of the methods employed to arrest hæmorrhage and check the growth of these tumours. I can only say at present that we practised incision of the cervix, the use of the actual cautery, as recommended by Dr. Greenhalgh, the injection of styptics into the cavity of the uterus, and the hypodermic injection of ergot, with moderate success. In none of the cases was enucleation or forcible avulsion practised.

Ovariotomy was performed twice unsuccessfully. In one case death was due to shock, the density of the adhesions rendering the removal of the cyst a matter of the greatest difficulty. In the other cirrhosis of the liver was found on a *post-mortem* examination, which, in the absence of any symptom indicating hepatic disease, was not suspected during life.

I much regret that the limits to which I must necessarily confine this report renders it impossible for me even [to touch on many interesting subjects. I trust, however, next year to make the report of this department of the hospital somewhat more full than it is on the present occasion.

HOME HOSPITALS : THEIR SCOPE, OBJECT, AND MANAGEMENT.

By Henry C. Burdett, Esq.,
Greenwich.

The scheme for establishing home hospitals for the well-to-do, as you doubtless know, has lately created much attention and criticism, and I cannot but conclude that most of you are acquainted with the object of such institutions. It has been proposed to form an association for the purpose of erecting home hospitals, to which persons who can afford to pay for their treatment may be admitted, when ill, on payment of a certain sum *per diem*, according to their means, and (to a certain extent) also according to the requirements of each case. It is not, however, intended that this sum should cover the medical expenses, but probably (these details are not finally settled) each patient will be left to make his own arrangements with his own doctor. I wish, in this paper, to lay shortly before you, as the representatives of the medical profession, the advantages and disadvantages of such a scheme, and to invite discussion upon the same ; for it can hardly be denied that the cordial co-operation of the medical profession, which has been largely secured already, is needful to render this undertaking successful. Let us first consider the advantages of the scheme.

What is the present condition of a person in the middle class of life, with a limited income, when struck down by illness? As an example, we may take a case in which the husband and father of the family is suddenly seized with, say, a bad attack of pneumonia. He is put to bed, and after a certain time, as he seems to get worse, his wife sends for the doctor. The doctor prescribes poultices to his chest, medicines at certain times, light diet of milk, beef-tea, &c. ; and also enjoins perfect rest and quiet. How are these orders carried out? The poultices are too often half cold, sloppy, pasty messes, improperly fastened, and continually slipping, perhaps also left on him till they become sour ; the medicine is forgotten or given at the wrong time, milk, perhaps, is not procurable, the beef-tea is a greasy compound of fat and dirty-looking water, whilst the perfect quiet so necessary to him is broken by the continued noises made by the children, with the mingled hubbub of the streets, adjoining houses, and neighbouring factories. The nursing, day and night, the extra cooking, the attention required by the children, and all other domestic matters, fall on the poor wife, whose temper and endurance at last give way, probably not before those of the unhappy patient.

But how are all these troubles increased when the wife herself is the victim? The husband obliged to leave for his work, some friend or relative brought in as a nurse who knows little of such duties, the troublesome children (ten times more troublesome under the control of a stranger), and, in addition, thoughts of domestic cares trouble the poor sufferer's brain.

I feel sure that cases such as these must have frequently occurred to almost all of those here present, taxing their energies also to the utmost, and making them feel that their fight with disease and death is carried on against fearful and unnecessary odds. Surely, you must all, gentlemen, have often longed to remove your cases from such surroundings to the quiet and peaceful repose of a well-regulated hospital, where they would also receive proper diet and nursing from skilled and methodical hands.

Another class which would receive most undoubted benefit from the institution of such hospitals is the lodger class. The condition of governesses and of young men—clerks, students, and such like—occupying lodgings often at a great distance from their homes, when struck down by illness, and left to the tender mercies of their landlady, is so deplorable that I feel it to be quite unnecessary for me to do more than mention it. To the above may be added clergymen, lawyers, officers in the army, navy, and civil services, men who are engaged in public and private offices, persons of education with limited means, and many others. To each and all of these the home hospital will prove an inestimable boon. And here I would say at once that it is not proposed to take people from their *comfortable* homes to hospital because they are ill, but to provide institutions for the treatment and cure of disease as in hospitals, by skilled nursing, rest, and regulated diet, under proper sanitary and hygienic conditions, with the comforts of home, for the benefit of a large class of the community who have no homes, or whose homes are ill-adapted for the successful treatment of serious illness. Further, I wish it to be known that, whereas the first object of the Home Hospital Association is not gain, but the advantage of the community and the relief of suffering, still it must be distinctly understood that it is regarded as essential to the success of these hospitals that they shall from the first be entirely self-supporting.

I have already said that it is proposed that each patient should choose his own doctor, an arrangement which it is hoped will prevent any professional ill-feeling, and also help to overcome the prejudice existing in the minds of so many against entering an hospital. Nor is this the only advantage in the medical arrangements; for it is also proposed that there shall be a resident medical man attached to each hospital who will always be at hand in case of emergency, and who will assist in carrying out the treatment of the other medical men. Speaking for myself, I am at present doubtful whether a resident medical man is or is not a *sine quâ non*. It is allowed that these hospitals must be small and scattered; there will be very little work for the resident medical officer, whilst his maintenance and salary will be an increased burden on the hospital. It might be better to appoint the nearest medical man to visit the hospital twice a day and in cases of emergency, and to give him a small salary for so doing; or to call him in, in lieu of salary, to those cases which have no choice as regards the doctor by whom they are attended. This latter plan will help to get rid of one difficulty that has been greatly felt; it is also a plan that has already been found to work exceedingly well in cottage hospital practice, and I see no reason why it should not do so when applied to home hospitals. It might be supposed theoretically that it would lead to a good deal of professional jealousy, but practically that is not found to be the case, and we may leave this arrangement with confidence, in my opinion, to the good sense and discretion of the medical profession.

Speaking of this system after several years' experience, Mr. Edmund Crossman of the Hambrook Cottage Hospital says:—"This professional intercourse is not the least valuable point in the cottage hospital system to the medical profession in the country. For the most part practising each in his own district, without much time for social intercourse, and accustomed to act upon his own judgment and responsibility, a feeling of distrust and jealousy too often springs up, which, in most cases, only requires for its removal more frequent professional communication. The neutral territory to be found in village hospitals is the starting-point for that neighbourly feeling and action which promote the interests of the profession as much as that of the public, and the consultations held over the hospital patient is often the commencement of cordial co-operation in private practice." What has proved so great a success in cottage hospitals for the poor may surely be tried with confidence in similar institutions for the well-to-do classes.

Another advantage attending the establishment of these hospitals is, that they will do away with a large amount of almost necessary fraud which is at present carried on. I refer to the abuse of hospital charity. What is the class of people who can afford to pay for their treatment to do under the present arrangements? If they go to the hospitals and beg to be taken in on payment, they are turned away. Some have consequently felt justified in resorting to what is really a system of fraud, until they have almost begun to look upon it as a right that, whenever they are taken dangerously ill, they shall be treated gratuitously in the general hospitals. By this means the charitable public is robbed and the profession deprived of its well-earned fees; but after all, however, it is hardly right to abuse this class of people too much; for what are they to do? Are they to risk their lives amidst the troubles and discomforts of home, or is it to be wondered at that they persuade themselves that a little deceit in such a case is justifiable? Gentlemen, by the establishment of home hospitals, you will, I believe, be not only meeting the bodily wants of this class, but you will also help to raise them socially from the pauper class to which, in this respect, they seem fast falling. It seems to me lamentable that, by a mischievous system of misplaced charity, their pride and self-respect should have fallen to such low depths that the artisans of this country now undoubtedly regard free medical treatment as no degradation, but as a distinct right.

Again, the great cry in these days is for nurses. We have nursing institutions springing up all over the country, and it has become quite the fashion for ladies to take to nursing as a livelihood; still there are not enough. To show how the establishment of home hospitals will partly help us to abate this difficulty, I feel that it is necessary only to quote the words of Mr. Walter, M.P., in his speech at the Mansion House on this subject. He says:—"Look at the waste of labour in the present domestic system of nursing. Supposing that in an ordinary street there are twenty cases of illness, and that each home has a nurse, what an enormous waste of power is there compared to what there would be if the invalids were all under one roof!" Thus we see how wheel turns within wheel, and how, by the establishment of these invalids' homes, instead of strengthening the present complicated hospital system, with its abuses, as our opponents assert we shall do, we shall in reality help to get rid of two of these burning questions: viz., the abuse of hospital charity in the in-patient departments, and the scarcity of nursing help at present available for those who are able and willing to pay for such comforts. I feel that it is necessary, before leaving this part of my subject, to touch briefly on two questions: 1. What are we to do with infectious cases? 2. Shall convalescent sea-side homes form a part of the scheme?

As regards the former, there seems some reason to think that, in the metropolis at least, the present accommodation for these cases is sufficient. I shall have to return to this branch of the subject again, so will merely draw attention here to the ease with which the present fever hospital could be amalgamated in this larger scheme with, in my opinion, mutual advantage, the hospital gaining patients, of which there seems a scarcity at present, and our scheme finding a hospital ready built and at hand for the experiment.

As to convalescent seaside institutions, especially for the recovery of infectious cases, the outcry for them is so great and general that I think they must perforce form part of the scheme, and a part that cannot possibly fail of success. The necessity of change of air for a convalescent, the great saving, the extra care and comfort of living in such a house as compared with the disadvantages of lodgings, and the lessened risk to the general public, are all strong points in favour of the establishment of convalescent homes for all who can afford to pay for such accommodation. So far for the advantages of our scheme. At first sight they seem great indeed, and make us wonder what can be urged against it; but, on analysing the scheme more closely, we shall find the objections not inconsiderable, and into these we must now inquire.

Objections.—The first objection to be overcome is that of prejudice. This must not be esteemed a small matter; in fact, it is really *the* great objection; it would be a sad thing to build our hospitals and then find that hardly any one would enter them; but so deep-rooted is the prejudice against hospitals in the minds of many that it is possible it will only be after some years of care and patience that we shall find the homes will be largely patronised. It seems extraordinary that persons when ill should prefer all the fearful discomforts of home to the care and quiet of a hospital, yet such is the case, and the fact is not likely to be lessened in the minds of those whom I address; for all medical men know the very rooted prejudice existing on this question. It is more extraordinary still that the lower middle class (if I may so speak) feel this prejudice more strongly than the higher middle class, though they are more likely in reality to receive benefit from it, and it is only, I believe, from the example of the latter that we can hope in time to eradicate the prejudices of the former. In the meantime, it is, therefore, our intention not to attempt too much at first, but to be content to do things gradually, and with due caution.

The next chief objection is the financial aspect. First, we require money to float the enterprise; there is little doubt but that this will be readily forthcoming. At first it was proposed to form a limited company with shares to work the homes; but, after mature consideration, the Provisional Committee selected as a financial basis the system of governorships, by which a preliminary capital fund will be formed for the purpose of founding and furnishing the first home hospitals required. This principle is that which has long been successfully adopted in founding various institutions, such as public proprietary schools. The invalids' homes or hospitals thus founded will, by virtue of a graduated but remunerative scale of payments, prove permanently self-supporting. Many persons argue that it will be impossible to make these home hospitals self-supporting, but I am at a loss to know upon what they base their argument because I find that in other countries similar institutions have not only proved so, but they have in several instances yielded a good profit over and above the working expenses. Gentlemen, on this point I can only assure you that, if we do not succeed in making these homes entirely and absolutely self-supporting, you need have no fear that we shall consent to add another to the already too extensive list of eleemosynary medical charities, for such a result will be regarded as a complete failure, and the scheme will be abandoned.

It has been asked, Why is not the present fever hospital self-supporting, and why is it so little used? The reasons for this, in my opinion, are many and obvious. It is a single building, or nearly so, of its kind, and consequently little known; whereas, if some hospitals were regularly established, they would soon become well-known and sought after. This hospital also at one time took in pauper cases, and I fear the reproach still clings to it. Being single, it often entails for removal to it a prolonged, perhaps dangerous, journey from the other end of London; whereas it is part of my scheme to have these home hospitals small but numerous, so that they are ready of access to everyone. A person admitted into this hospital is thrown suddenly amongst total strangers, without even the privilege of being attended by his own family doctor, should he so desire it; the reverse of this is a great advantage to the present scheme. The present hospital has too much the form and rules of a hospital, with perhaps too strict a discipline for the feeling of home comfort, while it is a principle in the home hospitals to combine more of the hotel character with them, thus greatly increasing the feeling of homely ease and independence. Other reasons will probably present themselves to the minds of my hearers; but I think I have sufficiently pointed out the differences in the two cases.

An opponent of this scheme stated, at the Mansion House meeting, as an argument against the establishment of home hospitals, "that it was the opinion of the great mass of medical men that it was desirable to reduce the number of hospitals for surgical cases to a minimum; for every gentleman of standing would do an amputation, or any other such case, at a private house." Now, let us grant him, for a moment, that such cases do very badly in large general hospitals; still I must maintain that the cases are not analogous. It is designed to establish numerous small hospitals in London, which would come much more under the designation of cottage hospitals, and I would refer this gentleman to my book on that subject, in which I have conclusively shown the very much lower rate of mortality in cottage hospitals after surgical operations than in large general hospitals, and this in spite often of less skilled and mature surgical experience. These results, in cottage hospital practice, could not, I believe, be surpassed in home practice, were it possible to collect such statistics. This is, to my mind, a conclusive answer to this objection.

Lastly, we have that old bugbear professional jealousy. Gentlemen, you will, I think, agree with me that it is time for this term to be dropped from our vocabulary; it is an old one that in its time has done the profession nothing but harm, and caused many a sneer from outsiders. In reality, I believe that it has been for some time only just alive; let it die. In proof that this is so, let me again bring before you that excellent movement, the cottage hospital system. This has for many years been carried on quietly and unostentatiously in your midst, on much the same principles on which it is proposed to establish these home hospitals—viz., payment by patients for their board and maintenance, attendance by a doctor of their own choice, and the supervision of the nearest medical man as house-surgeon; to these principles it is now only proposed to add one more, and that, I believe, in the right direction—viz., payment to the doctor for his services, Now this cottage hospital movement has had a very fair trial, but at first the same objections were brought forward as those of which we now hear, more especially this one—professional jealousy; but we find that in practice no such feeling has been called into being, but the movement has rather tended to draw into closer relationship and friendship our country brethren. It is necessary on all occasions to "bear and forbear;" no doubt at first cases may arise and cause for a moment some heart-burning, but with a little tact and patience they may easily be avoided, and it would be a great scandal on the medical profession if such an objection were allowed to upset a scheme with so many obvious advantages.

It will be seen that I have treated the subject of home hospitals in a general sense. My reason for doing so is that the Provisional Committee have thought it best to raise the necessary funds before deciding the exact basis upon which these homes shall be worked. That the ultimate decision will be a wise and satisfactory one is assured by the fact that amongst the members of the Management Committee who will decide these important details are the treasurers of Guy's and St. Thomas's Hospitals—Dr. Quain, Mr. John Erichsen, and Mr. Ernest Hart. The chief object I have in raising the question to-day is to afford all the members of the Association who take an interest in this scheme—which is one more step in the cause of hospital reform—an opportunity of expressing their views on the subject for our guidance and instruction. That the home hospital is calculated to supply a great and long felt professional want is proved by the fact that I have the pleasure to append to this paper a declaration signed by nearly every leading member of the medical profession in London, who have endorsed the scheme with an unanimity and a readiness seldom, if ever, equalled on any former occasion, and I leave the issue, therefore, with confidence in your hands. The scheme is the outcome of ten years' hospital experience, and it is gratifying to me to be able to state that in less than a fortnight nearly £4,000 have been subscribed by the general public.

Clinical Records.

ST. MARY'S HOSPITAL.

Case of Aortic Regurgitation with Sphygmographic Tracings. Remarks on Estimation of the Amount of Valvular Incompetency.

Under the care of Dr. HANDFIELD JONES, M.B. (Cantab), F.R.S.,
Physician to St. Mary's Hospital.

CASE—E. G., æt. 34, ad. May 5th, 1877, sailor formerly, last six years a brewer's labourer. Has been in India

and China, but never had fever or dysentery, nor rheumatic fever. Has been deaf five years. Complains of pain at upper chest, across and middle upper sternal regions. Breath short, but can walk a mile slowly. Spits now and then a little blood. No anasarca. Urine (May 7th) not albuminous. Shoulders high, neck short, dorsal spine much arched backwards, but little movement of abdomen or lower ribs in respiration, upper ribs move more. Breath sound very weak everywhere in lungs, no râles. Marked pulsation at sternal notch, the finger pressed downwards here seems just to reach the arch of aorta. Precordial region bulged, impulse evident at fifth space one inch outside vertical line, and also at epigastrium. Dulness area extends from vertical nipple line across to right edge of sternum; and from horizontal nipple line down to sixth rib. At midsternum, a weak first sound is heard, and a prolonged diastolic murmur; no second sound. At xiphoid, first sound is more distinct, and murmur is less loud. At fifth space in vertical line first sound is well marked, and the murmur is but slightly audible. Diastolic murmur is much louder at second right cartilage, than at second left. On both sides of neck a loud rough murmur is heard, systolic in time, this is much weaker at second right cartilage. Broth diet, beef-tea, milk. Liq. ferri muriatis, ℥20, + spt. chlorof. ℥x., + aq. ℥j. *ter die.* No notable change took place until he went out June 1st. Two tracings were taken, the first on May 7th, the second May 30th. The first required a much stronger pressure to develop the form than the last, otherwise there is no material difference between them. For comparison's sake a tracing is added, taken from Dr. Galabin's essay (p. 318, *J. of Anat. and Phys.*, vol. x.).

In this case there was free or copious regurgitation; while in E. G., this seems to have been much less considerable, according to the criterion laid down by Dr. Balfour, viz.: that a double murs mur heard in the carotids indicates very considerable incompetence, a systolic murmur alone comparatively trifling incompetence. E. G's. tracings indicate very positively a notable increase of arterial tension; in the other this is quite absent, or nearly so. The increased tension was not caused by senile change in the vessels, nor by renal disease, and is therefore no doubt dependent on the unduly large amount of blood injected at each systole by the hypertrophied left ventricle. *Cæteris paribus*, it may be said that the more marked the tension signs, low primary rise, flat top, early dicrotism, are in the tracing, the less is the amount of regurgitation;

No. 1.

Tracing of E. G.—Moderate aortic regurgitation.

No 2.

Tracing of free aortic regurgitation (Galabin).

and *vice versâ*, the more conspicuous their absence is, the greater the incompetency. The tracing taken with proper precautions as to pressure, will show perhaps more definitely than any other method the true condition of the arteries in respect to tension; and hence we may infer the amount of incompetency which will vary inversely as the tension. If, however, morb. Bright, or arter-capillary fibrosis lessen the outflow from the arteries into the veins, tension will of course be increased thereby, and the amount of aortic incompetency cannot be accurately determined.

The point to which I have drawn attention in the foregoing, has not escaped the attention of Dr. Mahomed, who remarks in his papers, *vide Med. Times and Gaz.*, ii. 144, that "the sphygmograph forms a good guage of the amount of regurgitation."

New Inventions.

A NEW TRACTOR OR MIDWIFERY FORCEPS.

By Dr. Roussel (Geneva), London.

The midwifery forceps should be an instrument of accommodation and of traction, a lever and a tractor. The manipulation and dexterity required at the hands of the surgeon cannot be well given when muscular strength is exercised; further, in some cases the traction requires such considerable muscular strength that the surgeon has to take a firm stand, often with his knees on the bed of the woman, and also to call in help to assist in traction of the forceps to hold the patient firm. This assistance is neither pleasant to the patient nor is it skillful. Besides the muscular strength of several men pulling together cannot be weighed or regulated, the strength being naturally intermittent, a great part of the progression obtained at each effort is lost in time of rest; thus the accommodation or the extraction being hindered, in many instances the child dies, and the mother runs the risk either of vesical fistula from prolonged compression, or of perineal rupture from too sudden and violent extraction of the child.

Dr. Chassigny, and the late lamented Prof. Joulin, are the promoters of the *méthode des tractions mecaniques continués*, and have constructed instruments adapted to this purpose.

Chassigny's apparatus consists in a steel band, to be placed before the knee of the woman, and furnished with a *roll* to draw on a string fixed on two hooks of a special forceps.

Joulin's apparatus consists of a steel band, to be placed before the upper part of the femur of the woman, and is furnished with a long screwed stem, like an *écraseur* to draw on a string passed through the opening of an ordinary forceps.

Many successful operations have been performed with Joulin's apparatus, but French practitioners have objected to it, as, by this instrument, one cannot draw exactly in each direction of the axis of the pelvis, and thus this method has made but little progress. It appears to me that the principal defect of construction in these apparatus is: That there is too great a distance between the point of resistance on the head of the fœtus and the point of tractive power.

The rectilinear band of Joulin cannot remain fixed opposite the brim, because it runs back in front of the mother's thigh. In consideration of these defects, I have constructed a tractor with a roll-screw instead of the long screw stem of Joulin, and my steel band is enlarged and fenestrated like the blade of a forceps to fit exactly the ischial prominences of the woman, and capable of slight movement, will thus remain always opposite the axis and change of pelvic position.

Stages of the Operation.—A strong cat-gut string is passed through the opening (fenestrum) of each blade of the forceps before its application, the mode of which is unchanged. The forceps being locked the steel band is placed in position, viz., against the buttock of the patient who is lying on her back with her thighs raised. The string is fixed on the roll-screw, then the surgeon manages by each turn of the screw to draw the child at every pain; during the time of rest he directs the handle of the forceps according to the successive directions of the axis of the pelvis. Mechanically this instrument offers the same advantages to the accoucheur as the patent barrel corkscrew affords to the connoisseur of fine old wine, bottles of which ought not to be shaken by a vigorous servant, but steadily opened by a cautious master. After many operations with this and many other like instruments in ten years' practice, I feel certain this method affords great help to the surgeon, and safety to the mother and child, without having any serious objections, except its novelty. It ought to be employed in those cases where the application of the forceps is necessary, and the pelvis is not contracted under two-and-three-quarter inches (0·070 millimetres), and

also continued so long as the dlyncomometer of the tractor indicates a strength under 70 kilos, under 70 millimetres of narrowing, and over 70 kilos of tractive power, the necessity of perforation presents itself. At these points perforation alone is sufficient, and can be practised by introduction of the scissors between the blades of the forceps without removing the tractor.

Finally, I wish to place myself under Dr. Barnes' scientific protection in quoting once more his own words, "I cherish a fervent hope, that the exposition of the principles and method of continuous mechanical traction, will be the means of materially enlarging the field of application of the forceps, and of supplanting in a corresponding degree the resort of hazardous turning, or of the revolting operation of craniotomy."

WEDNESDAY, AUGUST 22, 1877.

THE ADDRESS IN SURGERY: BRITISH MEDICAL ASSOCIATION.

A BETTER man could not have been invited by the British Medical Association to give their address in surgery, than he who has himself contributed so much towards the perfection of one of its most formidable operations. Nor could he, perhaps, have selected for his theme a better subject than the recent advancement and future prospects of an art, the rapid progress of which has been one of the most extraordinary features in its history.

It does not appear so very long ago when surgery was, as Mr. Wells remarks, carried on as a trade, after the fashion of country farriers of our day; when it was unlawful for surgeons to administer internal remedies, even in cases of wounds; and when "Bokes of Chirurgerie" were nothing more than collections of sayings and nostrums. Since that time, marked by the brilliant achievements of the Elizabethan era, there is no science (chemistry, perhaps, excepted) which has made so much progress; while, during the last fifty years, this progress has been more rapid than at any previous period. The advancement of surgery has been one continual triumph of art over disease. It has been a triumph of art and operative skill; for, take away the brilliant operations which have characterised its progress, and you deprive it of the strongest claims it has upon the admiration and gratitude of mankind. It is the wonderful and, to some extent, mechanical resources of surgery which so strike the attention of the public, and which make it in their eyes the successful rival of the sister art of medicine. There are thousands who are sceptical of the power of medicine over disease; there is not one to be found who has a doubt about the skill and resources of the surgeon.

Among the more formidable operations, the successful performance of which has signalised the progress of modern surgery, there is none so remarkable as the operation of ovariotomy; and, considering the great share Mr. Spencer Wells has had in establishing the claims of this operation upon the confidence of the profession and the public, it would have been false modesty on his part had he made no reference to the large number of cases which he has conducted to a successful issue. Sir James Paget has remarked that the improvements that have been made in ovariotomy constitute one of the greatest achievements of modern surgery in this century, and that the influence for good extended through every department of operative surgery. But may we not go further, and say that this influence should extend throughout the province of medicine also? Does not the progressive perfection of this formidable operation, and indeed of practical surgery in general, convey certain suggestions which might be turned to some account in the future advancement of medicine? If the determination to remove a fatal disorder from the list of incurable diseases, if reliance upon the reparative powers of Nature, if the careful selection of the cases submitted to curative treatment, and if perseverance in following out the plan marked out in spite of temporary failures, and the avoidance of everything that is likely to interfere with the success of the treatment—if these conditions have done so much for the advancement of operative surgery, they may certainly do much for the future advancement of medicine. One reason why surgery has been so successful is because it has always been a pre-eminently practical art. It has had less to do with the minutiæ of pathology and diagnosis. From the earliest period in the history of surgery the surgeon has steadily kept in view the treatment and cure of his patient, whereas the vast amount of study that has been devoted to morbid anatomy and pathology has, in conjunction with the greater difficulties to be surmounted, diverted the attention of physicians from the more practical duties of their profession, and even made them lose confidence in the efficacy of any kind of therapeutical treatment. And thus while surgeons are talking of achieving fresh triumphs in their department of the healing art, and of extirpating uterine tumours with as much success as they now perform ovariotomy, some of us

entertain far less ambitious views with respect to the advancement of therapeutics, and talk of falling back upon hygiene as the most hopeful feature to look forward to in the medicine of the future. There are some physicians however, who have in them some of the dash and *élan* of the practical surgeon, and who are not satisfied with making a refined diagnosis and leaving the rest to Nature. It was with no small amount of pleasure that we read Dr. McCall Anderson's clinical lectures on the successful treatment of what has always been regarded as the most incurable form of pulmonary phthisis : and although we are rather sceptical with regard to the correctness of his diagnosis, and the inferences he drew from a few and insufficient data, we could not but admire the thorough and systematic manner with which he grappled with his cases, and the confidence he showed in the resources of practical medicine.

It is natural for the practical surgeon to be interested in the subject of anæsthetics, and therefore we are not surprised that Mr. Wells did not wait long before he put to the test the anæsthetic properties of the bichloride of methyline or chloro-methyl. An experience of ten years of no fewer than 850 serious operations convince him that all the advantages of complete anæsthesia, with fewer drawbacks, could be obtained by the use of this compound. He speaks of it in such high terms, and the test to which he has put it is such a severe one, that the propriety of bringing it into general use should certainly receive the consideration of the profession, especially as chloroform is by no means so popular now as it was a few years back, and ether does not seem likely to take its place. We therefore cordially agree with what Mr. Spencer Wells has said on the subject. As he truly remarks, "deaths from chloroform are remarkably frequent, and yet no substitute for it has found universal or even general acceptance in this country ; and it is the duty of the Association to at once satisfy the public that all that is possible is being done to discover the means by which anæsthesia, effectual now, may be rendered safe for the future."

We were not sorry to see that Mr. Wells did not forget the recent agitation on the subject of vivisection. He regarded it as affecting the advancement of practical surgery, and spoke of it in the same contemptuous terms which we have often made use of when writing on that subject.

"A certain section of the community," he said, "led astray by thoughtless enthusiasts, or self-interested itinerant lecturers, vehemently asserts that if we are to perfect ourselves in these (surgical) or any other modes of saving human life, we must only do so by practising on the human subject. . . . . If a surgeon experimentally sacrifices half a dozen dogs or rabbits, in the hope of improving some operation which may prevent the loss of human life or lessen human suffering, he is branded as inhuman, and barely escapes the supervision of the police. Possibly some of these benevolent individuals will voluntarily offer up themselves to our Committee on Transfusion in the hope of perfecting the practice. Until they do so they will, perhaps, be a little less clamorous if a few sheep or rabbits are used in the cause of humanity." Indeed, this movement was altogether such an absurd ebullition of party feeling, that it is difficult to ridicule it as it deserves. Practical surgery, however, has more than once been advanced, and may yet be advanced, by the practice of vivisection, and therefore Mr. Wells had some temptation to notice the recent agitation, instead of treating it with indifference and contempt.

In the retrospect which Mr. Spencer Wells has taken of the progress of surgery, he has mentioned several of the surgeons to whose genius and skill we are indebted for the great improvements which have been made in that art since the foundation of the British Medical Association. We should, however, have wished that more prominence had been given to those great names which are associated with the invention of new and successful operations, or with the greater perfection of old ones. Far more credit is due to him who first suggested, and who had the ability and courage to be the first to successfully perform a new operation, than to him who rivals all his contemporaries in the skill with which he does what others have done on previous occasions, to him who has struck out new paths in the domain of practical surgery, than to him who merely keeps to those which so many have trodden before him. A surgeon may greatly distinguish himself as an operator without having made a single improvement in his art ; and perhaps we are too apt to forget the claims of those pioneers in surgical discovery who have not only lengthened human life and lessened human suffering, but have even contributed to the professional reputation and success of those who have followed in their steps. Dr. William Hunter was, we believe, the first to suggest the possibility of successfully extirpating ovarian tumours, but it was Mr. Jeaffreson, of Framlingham, who was in 1836 the first to perform the operation with success, while Mr. King, of Saxmundham, repeated the operation on another patient with an equally good result. And, considering much was said on the subject of ovariotomy it would perhaps have been as well if the orator had done more than mention the names of those who first planned and successfully performed this operation.

There is another point in this address which we cannot allow to pass unnoticed ; we allude to the high terms in which Mr. Wells acknowledged the great professional skill and ability of the late Mr. Baker Brown. Now we can look back upon an event connected with his life calmly and dispassionately, it is right not to allow former prejudices and animosities to stand in the way of giving to that surgeon due credit for the contributions he made to the advancement of practical surgery.

MEDICAL REFORM AND THE BRITISH MEDICAL ASSOCIATION.

THE presentation of the Annual Report of the Medical Reform Committee of the British Medical Association, at the recent Manchester meeting, was the occasion of an interesting and significant passage of arms, from the tenour of which may be judged the position which the Association and the English general practitioner may be assumed to have adopted for the future. This Committee, it will be recollected, was created to agitate the direct representation of the profession in the General Medical Council,

and it has since devoted itself principally to the reform of the abuses of medical qualifying, and to the encouragement of conjoint examination. A few years ago great things were expected of it, and it was the father of bills in Parliament, which came to nothing, but offered, nevertheless, good examples for future legislation ; and which, if vigorously followed up, would probably be now the law of the land. At that time the *Journal* of the Association was loud and persistent in its advocacy of these schemes for conjoint examination, and the Association itself seemed to be about to achieve some distinction as a medico-political organisation, a position which it needs all the more because of the poverty of its scientific performances. Within the last two years, however, a wasting palsy seemed to have seized upon the Committee, and an aphasia upon the *Journal*.

Direct representation, long since forgotten, had given place to nothing discernible in the way of Medical Reform, and therefore the existence of the committee has for the last year been only appreciable by its annual report. The discussion of that report to which we now refer, makes manifest the cause of this lethargy. On the motion for the adoption of the report, the editor of the Association *Journal* (whose reported utterance appears liberally garnished with Cheers ! and Hear ! hear !), said that " the profession had far greater interest in desiring to see the Medical Act amended by an alteration of the fortieth section, the section which now permitted quacks and medical pretenders to practise, and which could be very readily amended without waiting for the more elaborate amendment of the Act proposed by the Committee."

This view was supported by Dr. Gairdner, of Glasgow (who, as a representative of a cheap Scotch Corporation, naturally did not see the propriety of medico-educational reform), but was warmly resisted by Dr. Waters, of Chester, the chairman of the committee, by Dr. Husband, of York, one of its most influential members, and Dr. A. P. Stewart, who said that if the editor's proposal were carried, " some of the members of the committee would not continue to act." In the teeth of this expression of feeling the amendment was carried, the meeting ordering the committee to apply itself to the alteration of the Quack's Clause of the Medical Act, and *instanter* Dr. Waters, Husband, and Stewart, resigned their places amongst its members.

The *gravamen* of this transaction is plainly that the British Medical Association has made up its mind deliberately to descend from the triumphant car of the medical patriot, and to accept the less-distinguished position of the trades-unionist. The correction of the 40th section of the Medical Act is a truly most desirable object, and it is already likely to be achieved by Dr. Lush, acting on behalf of Dr. Carpenter, and the East London Defence Association. Their efforts have our best wishes, but after all the object in view has a closer connection with the pockets than the hearts of medical men, inasmuch as the sole effect of such an amendment of the law would be to protect doctors from the competition of quacks, and to save the public from being cheated by incompetent pretenders. If the British Medical Association lays claim to the possession of a soul for science, and are ambitious for medical purity, it ought certainly to aim higher than the crushing out of those who compete for medical fees, and it is, therefore, we say, a somewhat humiliating come-down when the organisation, at the instigation of its most public representative, decides to throw science and reform to the dogs, and devote its attention to the loaves and fishes. In the face of so pitiful a decision, Dr. Waters, Dr. Husband, and Dr. Stewart, the veteran and much-esteemed champions of medical reform, could do no less than relieve themselves of participation in the small ambition of the Association and its editor, and we hardly expect that such men as Dr. Falconer, the Rev. Dr. Haughton, Dr. De Bartolomé, and Dr. Balthazar Foster, will give themselves any trouble with the proceedings of a committee whose *raison d'être* is now defined to be simply " medical protection."

THE PRESCRIBING OF NON-OFFICINAL PREPARATIONS.

A CORRESPONDENT of a medical contemporary draws attention to the habit which many physicians have of prescribing patented and specially-prepared preparations. " It is," he remarks, " a great confession of the poverty of the Pharmacopœia, when an M.D., F.R.C.P., &c., whom I lately met in consultation, ordered for the case (not an extraordinary one by any means) no less than four advertised medicines, internally and externally."

This habit, to which many in the profession must plead guilty, is one which, although liable to abuse, cannot be very well avoided, and is not objectionable if practised in moderation. We are indebted to the skill and thoughtfulness of the pharmacist for many of our most valuable preparations, and many of those that are now in the Pharmacopœia were originally such advertised preparations as those above-mentioned, and had been put to the test of experience by the profession long before they were admitted into the Pharmacopœia.

It is a great *desideratum* in modern pharmacy to make medicines as palatable, and to put them in as small a space, as possible, as well as to contrive preparations which, answering to these conditions, are at the same time a combination of two or three active ingredients. The days of nauseous draughts and huge boluses are past. It is now thought an important part of the physician's duty to prescribe no more medicines than are actually necessary, and to prescribe them in such a form as will be most agreeable to his patient. To treat a disease as *jucunde* as possible, is quite as important a precept to bear in mind as to treat it *tuto citôque*. At the same time, some caution should be observed in carrying out this principle. It will never do to sacrifice the activity and certainty of a preparation to its palatableness or its appearance, or to run the risk of encouraging quackery, or the importation into the market of a lot of superfluous or useless remedies, or to get into the habit of ordering all kinds of fashionable and patented preparations, to the neglect of those standard Pharmacopœial preparations which would be often found more serviceable.

Before prescribing these remedies, we should be sure that the active properties of the compound have not been partially lost during their preparation, and that they

really contain the reputed quantity of ingredients; for this is one of the disadvantages attending the use of some of the more elegant officinal preparations. It is only lately that there was found in the market a large quantity of the citrate of quinine and iron, which did not contain near its proper percentage of iron. It is evident that many of the new compounds we are speaking of can never be so reliable as the corresponding compounds prescribed extemporaneously. If a mixture is ordered containing quinine, perchloride of iron, and strychnia, the patient is more certain of getting the exact quantities of these ingredients ordered than if he took some advertised pills composed of the same drugs, and if the mixture is made up by the practitioner himself all doubt is at an end. Besides, the several ingredients of these non-officinal preparations are seldom prescribed in the proportion best suited to the particular case in which their administration is indicated, and that is another reason why they should not be often prescribed.

It may be that some of the physicians who are in the habit of prescribing patent or advertised medicines have forgotten, or lose sight of, many very excellent preparations contained in our Pharmacopœia. Materia medica is, unfortunately, a very neglected part of medical education. It is often shirked by men who have otherwise distinguished themselves during their medical curriculum; they make but a sorry figure in this department of medicine when they go up to the Hall, or to any other examining body where a fair knowledge of materia medica is expected of the candidate; and what is worse, they often neglect to improve their knowledge of the subject when they get into practice. Consequently, their acquaintance with the Pharmacopœia is not so thorough as it should be; they lose sight of many valuable officinal preparations, and too readily patronise those they see advertised by the chemists in the medical journals.

It is to be hoped, therefore, that we shall not hear of medical men too freely indulging in this habit of prescribing advertised or non-officinal preparations, and that they will, as much as possible, order the crude drugs, or the more simple Pharmacopœial preparations, in such combinations as the peculiarity of the case may require.

Notes on Current Topics.

Gleanings from some Lunacy Statistics.

Some interesting facts may be gathered from the last annual report of the Glasgow Royal Asylum, Gartnavel. There were 566 patients in the asylum at the beginning of the year 1876. There have been 228 admissions, making a total of 794. Of this number there were 210 discharges and 52 deaths, so that at the close of the year the number of patients was 532. Of these 88 *recoveries*, 77 took place within a year of the patient's admission, and 57 of these within six months. This shows that the prospect of recovery lessens very rapidly after the first six months, and that early treatment is of great importance. Of the 52 *deaths* 11 were caused by general paralysis, and 13 from pulmonary phthisis, whilst the other fatal affections did not cause more than one or two deaths respectively. Of the 11 deaths from general paralysis, while 10 occurred among the men, only one occurred among the female patients.

With regard to the *causes* of insanity, as illustrated by these statistics, Table X. points (says the Report) unmistakeably to the bodily origin of insanity; for while 143 cases are assigned to physical causes, mental causes are credited with only 12 cases. Of the above 143 cases, 31 are put down to intemperance, 29 to previous attacks, 10 to epilepsy, 7 to masturbation, 31 to hereditary influences, and 4 were congenital. The majority of the cases due to moral causes arose from business or domestic anxieties, or from religious depression, and most of them (8 in number) recovered.

With regard to *intemperance* as a cause of insanity, Table XVI. gives some interesting statistics, beginning from the year 1824. From this it appears that, during the first ten years, in which the total number of admissions was small, only from 1·3 to 8·43 per cent. were due to this cause. From 1838 to 1846 the intemperance cases were more numerous, and, with one exception, amounted to from 13·42 to 26·49 per cent. From 1850 to 1876 there has been a gradual diminution in the number of cases admitted from this cause; for while for the first ten years of that period the percentage was high (ranging from 13·28 to 21·15), it was not more than half this during the next centennial period, rising a little again during the years 1871-1876. This is perhaps to be accounted for by the fact that, for the last few years, there was a decrease in the pauper patients, owing to accommodation having been found for them elsewhere.

It is generally allowed that single life is more favourable to insanity than *married life*, and this fact is borne out by Table IX. of this Report, from which it appears that out of 228 admissions 104 were single and 92 married; and moreover, while only 16 of the 52 deaths occurred among the married, 29 occurred among the single. Not less interesting is the account of the *occupations* of the patients, for we find that while all other occupations only contribute one or two cases respectively, 11 gentlemen are among the total number (116) of male patients, 24 labourers, and 14 miners. Of the 112 female patients, 17 were "ladies," and 75 engaged in domestic occupations.

With regard to the causes of insanity generally, Dr. Yellowlees well observes, that "beneath all the apparent or exciting causes of insanity, the real and efficient one is found in the unstable nervous system of the individual. This instability may be inherited or acquired—inherited, possibly, from parents who have shown no obvious insanity—acquired, perhaps, quite unconsciously by the individual; but its degree is the true measure of liability to insanity, and of the danger of mental shipwreck in the storms and turmoil of life. This explains why some minds are upset by apparently trivial causes, while others remain calm and unshaken through a lifetime of affliction and sorrow. Yet the immense significance of nervous instability in the history of the individual and of the race is ignored every day."

In glancing over the list of expenses it is clear that the non-alcoholic treatment of disease receives little support from the practice of this institution, and that, as we might

have supposed, even in the treatment of insanity alcoholic stimulants cannot be wholly dispensed with. During the year 1876, 110 gallons of spirits (including what was required for the laboratory), 1,209 firkins of beer, 573½ doz. pints of porter and ale, and 152 doz. quarts of wine were consumed, at an outlay of £598 14s. On the other hand, the expenses for drugs amounted to only £47 13s.

Vaccination in Ireland.

THE statistics of vaccination in Ireland for the past year, show a decrease of nearly 23,000 cases, in comparison to the number of cases in the previous year. The following are the figures :—

	Under One Year of Age.	Above One Year.	Other Persons.	Total.
1875	94,370	25,305	17,665	114,48 7
1876	93,061	19,428	1,998	137,340

This decrease at first sight the Local Government Report considers remarkable, but admits of explanation to a certain extent.

During the presence of small-pox in districts more or less panic exists amongst the inhabitants, who usually in large numbers avail themselves of the protective influence which the operation of vaccination affords, and thus vaccination and re-vaccination are had recourse to ; but when, as a consequence of its cessation the alarm caused by the immediate presence of the disease abates, re-vaccination is not had recourse to, and parents are not so prompt in bringing their children even for primary vaccination, and the result in general, if not invariably, is, that the year following an epidemic of small-pox there is a considerable reduction in the number of persons vaccinated.

The statistics of vaccination during the year ended September, 1875, when compared with 1876, (to which this report refers), show this very forcibly.

During 1876 the number of cases of small-pox recorded by the medical officers of all the dispensary districts is only 29, consequently there was no cause for unusual alarm, and vaccination was not so actively conducted, and re-vaccination was little resorted to.

During the year 1875, 881 cases of small-pox were reported, of which 140 occurred in Ulster, and 674 in Connaught, and it is in those two provinces that, as might be expected, there was such an augmentation in the number vaccinated during the prevalence of small-pox, and a corresponding falling off the next year, 1876, the disease having subsided.

During the prevalence of the disease in a severe form in Ulster and Connaught 21,426 persons, all upwards of one year old, were vaccinated ; this number was composed of children not previously vaccinated and of cases of re-vaccination ; and in 1,998 instances adults offered themselves anxious to undergo the operation, they being under no legal obligation to do so, and they also brought their children to be vaccinated, thus showing their confidence in the protective influence which they believed the operation would afford.

Still, having regard to the number of children annually born in Ireland, the number vaccinated when under one year of age cannot be regarded as quite satisfactory.

Unprofessional Behaviour.

IT is lamentable to see the disreputable manner in which one medical man will sometimes behave towards another. One of our correspondents, a highly respectable surgeon, writes to us to complain of the conduct of a brother practitioner. A person applied to him at his dispensary for admission into an infirmary. As she was suffering from the effects of hæmorrhage, and being in a destitute condition, he gave her the desired certificate, and there he thought the matter ended so far as he was concerned. To his great astonishment, however, he heard a few days afterwards that the patient had been transferred from the infirmary to a small-pox hospital, that this measure had been taken on the strength of the diagnosis, formed by the medical man then officiating at the infirmary, in consultation with a practitioner in the neighbourhood ; and that while in the infirmary she was submitted to a process of disinfection and otherwise treated as a patient suffering from that disease. In the meantime, the local practitioner who had been so honoured by the medical officer of the infirmary, spread a report to the effect that our correspondent was incapable of recognising a case of small-pox when he saw it, and that it was not the first time he had made the same mistake. It turned out, however, much to the discomfiture of the infirmary doctor and his friend, that the case was not one of small-pox after all. The authorities at the small-pox hospital certified that the patient was not suffering from disease on admission. "She was" they stated, "successfully vaccinated, and discharged so far as her skin eruption went, in the same condition as that in which she was admitted."

It is almost superfluous for us to make any remarks on the above statement, as the facts speak for themselves. But we may remark that the medical officer of the infirmary can scarcely be said to be free from blame in the matter. It is not quite *en règle* for a gentleman in that position to call into consultation a general practitioner living in the neighbourhood, and the great mistake they both committed, must have made the former regret the step he thought proper to take. With regard to the unprofessional conduct of which our correspondent complains, we are afraid that it is of too common occurrence in the profession. The *odium medicum* is almost as rampant as the *odium theologicum*. There are, unfortunately, many members of the profession who would gladly avail themselves of an opportunity to traduce the skill and ability, if not the character, of a brother practitioner ; and what is worse, this scandalous habit is not confined to the lowest class of practitioners, but is even prevalent among a class of medical men who ought to know better.

Hospitals : a Suggestion.

IN his recent address before the British Medical Association, Dr. Eason Wilkinson touched upon the scheme lately agitated for providing hospital accommodation for the "well-to-do" classes. Considering the size of some of our existing hospitals, and the conveniences already established in them, would it not be better, said Dr. Wilkinson, to add wards to them for the reception of paying patients, who should be attended by their own medical men. Some objections which are now put forward in regard to management, &c., might thus be got over, and all

the advantages of hospital treatment might be obtained with a minimum of expenditure. The Hopkins Hospital, in Baltimore, U.S. which is now in process of erection is arranged upon this basis; and other hospitals on the continent of Europe carry out the same idea.

This suggestion is certainly worth the consideration of those who are desirous of securing good hospital accommodation and attendance for the middle classes. The principle of not encouraging the construction of special hospitals when the general hospitals suffice to carry out the object in view is a good one, although, unfortunately for the interest of the medical student this principle is too often disregarded. If, therefore, the above suggestion is found to be practicable and free from any serious objection, it would be as well if the Home Hospital Association, whose prospectus we lately noticed, took into consideration the propriety of adopting this plan before they attempted to carry out the one which they propose. But the plan above suggested is not so practicable as some may think. There is scarcely one hospital in London where there are any wards which could be put aside for the purpose. New wards would have to be built, and this would in all probability involve such extensive alterations, and require such a large outlay, that the foundation of a new hospital would be scarcely less expensive. The scheme may be more easily carried out in the event of any of our hospitals being enlarged or of new ones being built, when the propriety of setting one or two wards apart for the accommodation of paying patients might be taken into consideration. In our opinion, the demand for these home hospitals will be in time sufficiently great to warrant both the adoption of the principle at some of the general hospitals, as well as the erection of special institutions. Were the former plan adopted, the question would still arise as to whether the patient should or should not be attended by their own medical men. The system might work well either way, but in either case there are obviously certain disadvantages which cannot be well surmounted, but would have to take their course, and be judged of by their effects upon the working of the hospital.

Decrease in Dispensary Medical Relief in Ireland.

Coincident with the decrease of more than 31,000 in the number of paupers in Ireland last year, a remarkable decrease has taken place in the amount of dispensary medical relief. The report of the Irish Local Government Board shows that in Ulster there has been a decrease of 5,941 cases at the dispensaries, and of 7,097 of those attended at their own houses.

In Munster there has been a decrease of 5,160 cases at the dispensaries, and of 227 of those attended at their own houses.

In Leinster there has been a decrease of 1,828 cases at the dispensaries, and of 768 of those attended at their own houses.

In Connaught there has been a decrease of 1,270 cases at the dispensaries, and of 1,151 of those attended at their own houses.

This shows a decrease of 23,442 cases for all Ireland, including both classes, as compared with previous year; being 14,199 dispensary cases, and 9,243 cases of persons attended at their own houses.

The Ancestors of Marshal MacMahon.

The French medical journals have been raking up some reminiscences of the ancestors of the President of the French Republic, and as he has a Celtic name, and these biographical curiosities have somewhat of a medical interest, we reproduce some of them.

The grandfather of the Marshal, Duke of Magenta, was named Jean Baptiste, and received his Doctorate at Rheims, 4th August, 1739, and settled in 1742 at Autun, where he made a rapid fortune by marriage.

In an old medical calendar of 1780, the following notice is found :—

"M. MacMahon (Jean), of Leon, Irlandais, Ex-Physician of the army of the King and Military Hospitals, Physician to the Royal Military School."

In the Dictionary of Athenists, Ancient and Modern, by Sylvian Maréchal, supplemented by Delalande, page 72, there is the following story :—

"MacMahon, Physician Military School, was at the house of M. Jefferson when the existence of Atheists was denied, whereupon this man of six foot high got up and said aloud 'c'est moi.'" We must not believe this Jean MacMahon had for his motto "Sic nos, sic sacra tuemur." He was the friend of Voltaire, and he would be very much astonished if he could now learn that one of his grandnephews was the eldest son of the church.

He had only one son named Patrick, also a doctor of medicine, and librarian to the faculty of medicine, Paris.

Those of our readers interested in genealogy, will find further particulars in an interesting notice published by Dr. Achille Chereau, on Dr. Jean MacMahon, in the July number, 1875, of the *Jour. Pract. Med. and Pharmacology.*

Atheroma.

At the sitting of the Society of Public Medicine (Paris), June 27th, M. Gubler communicated an interesting paper on arterial atheroma. He believes many influences are at work in producing this alteration; whilst the rich in their old age are often exempt from it, the working class have a great tendency to it. The *rôle* of alcohol as a cause, has been blamed too much, the rich drink as much as the poor; alimentation plays a more important part, the wealthy have a more succulent and azotised diet, whilst the workman eats such vegetables as horse-radish, apples, which contain a large quantity of calcareous salts. The frequency of atheroma amongst those who abuse vegetable diet is due to these calcareous salts, in virtue of general laws. The *algæ* retain the iodine and bromine they take up in the sea, and from analogy, he considers that mineral solutions leave their salts in the tissues. Cretification especially takes place when the tissues are not well nourished; the middle coat of the arteries belong to this class, and is supported by imbibition. M. Gubler thinks it worthy of research to compare the frequency of atheroma amongst peasants living on lime formations, and amongst the rich who adopt a vegetable diet. The rarity of atheroma in localities poor in silica has been established, whilst Dr. Leblanc has verified its presence in Orleans, a lime formation, and Dr. F. Raymond has noticed indurated arteries in many young monks of the order of Chartreux, who lived exclusively on legûmes.

The Parliamentary Subsidy of Irish Pauperism.

The following is a statement of the Parliamentary grant for medical and educational purposes, and for salaries under the Public Health (Ireland) Act, 1874, for the year ended 25th March, 1876 :—

	£	s.	d.
Medical purposes . . .	69,586	5	10
Educational purposes . .	8,915	8	4
Total for medical and educational purposes . . .	78,501	14	2
For salaries under Public Health Act . . .	12,167	0	11
	90,667	15	1

The total amount claimed and allowed under the Parliamentary grant for medical and educational purposes for the year ended 25th March, 1876, namely, £78,501, is £206 less than the amount for the previous year.

The amount for salaries under Public Health (Ireland) Act appears in this statement for the first time.

Origin of the Term Syphilis.

Dr. Lunsford P. Yandel, Professor of Therapeutics and Clinical Medicine in the University of Louisville, ventures to offer a theory on the subject which seems to him more probable than any hitherto suggested. "The town disease," "the town disorder," are terms used by the lower classes, and especially among the rustics, to indicate this affection. Syphilis, from our first knowledge of it, has been eminently a city disease. The Latin word *civilis* signifies pertaining to a city or to citizens ; and it occurs to me that *morbus civilis, i.e.*, citizens' disease, or city disease, was probably the first popular name for syphilis. Furthermore, it is perfectly natural, and in accordance with popular custom, that, for the sake of brevity, the word *morbus* should have been dropped, leaving only *civilis*. The alteration in the spelling of the word is not remarkable. Chancre was once spelled shanker, scrofula was spelled scrophula, and often we find even the meanings of words wrenched entirely from their original signification."

Ergot in Atony of the Bladder.

Prof. von Langenbeck, at a meeting of the Berlin Medical Society, stated that in atony of the bladder, associated with enlarged prostate, in elderly men, in which the organ is never completely emptied of urine, he had lately tried the hypodermic injection of ergotin with most surprising results. In three cases, the contractile power of the bladder was at once increased so as to enable the patient to discharge additional urine, and in a few days it had so augmented that very little urine was left behind. After one or two injections the improvement was considerable, and even a diminution in the size of the prostate seemed to have ensued. Dr. Israel said that he had derived the same benefit from the employment of ergotin, and referred to the case of a patient who was thus enabled to hold his water for three hours, whereas before he voided it every ten minutes.

Astley Cooper Prize.

We learn that the prize for 1877 has been awarded to the Essay bearing the motto "Facta non verba," the sealed envelope accompanying which contained the names of Drs. Eulenburg and Guttman. The subject selected for the next prize is—"The Cranial Nerves, with reference to their Anatomy and its relations to Surgical Diseases and Injuries. The Essay to be accompanied by Preparations and Drawings clearly displaying the course and distribution of the nerves, and especially their mutual connections." Essays in competition, either written in the English language, or if in a foreign language, accompanied by an English translation, must be sent to Guy's Hospital on or before January 1st, 1880, addressed to the Physicians and Surgeons of Guy's Hospital.

The New Hotel-Dieu.

This hospital, says *Le Progrès Médical* of last week, already contains a large number of patients ; surgical operations will soon be performed there if they have not been already. The moment has therefore arrived to take as carefully as possible the means necessary to establish daily statistics of the hospital which are not merely of an administrative but also of a scientific character. . . . There will be also now the opportunity for the physicians and surgeons to communicate their opinions respecting the working of the different services of the hospital. We are all acquainted with the admirable reports which are annually published by the great London hospitals. The inauguration of the new Hôtel-Dieu affords a favourable opportunity for adopting this excellent plan.

Pharmaceutic Morality.

The *Chemist and Druggist*, referring to the case of a druggist convicted last week for selling castor-oil pills which did not contain a trace of the nominal ingredient, reminds its readers that "a literal fulfilment of legal requirements will be attained by combining a little castor-oil in the pills until the public is educated out of the misnomer."

When a public journal is found thus openly advising a dishonest evasion of the law and a deliberate fraud upon the purchaser, argument is no longer necessary to prove that Parliament is amply justified in interfering to control the traffic in adulterated drugs. Even a druggist's conscience must surely feel that "castor-oil pills" in which castor-oil is the active ingredient, and that to sell to a buyer who wishes to use that particular drug, a preparation which only contains a trace of it, is not honest.

Practice of Pharmacy in Ireland.

At the last Council meeting of the Irish Pharmaceutical Society an animated debate arose upon a motion made by Sir Dominic Corrigan that the hitherto existent rule which requires from students two years' practice of pharmacy "under the instruction of a pharmaceutical chemist or apothecary should be amended so as to restrict that practice to chemists and apothecaries" keeping open shop or in the compounding department of an hospital containing not less than 100 beds. An amendment was

proposed that the resolution should stop at the word "shop," it being urged that the experience of compounding in hospitals was inadequate for the requirements of a compounding establishment, which proposal Sir D. Corrigan accepted.

Sir G. B. Owens urged that a certificate from an apothecary who dispensed his own medicines should be admitted, and proposed a resolution to that effect.

The motion of Dr. Ryan was carried.

Importation of Small-pox to Ireland by Deported Paupers.

THE Local Government Board for Ireland alludes to this subject in its recently issued report. It says that last July small-pox prevailed in London, Liverpool, and Manchester, and the Local Government Board, apprehensive lest the disease might be introduced into Ireland by means of Irish paupers returned under removal warrant to their native country, addressed a letter to the Under Secretary for Ireland.

Communications were thereafter made to the Home Office, and lengthened correspondence ensued.

No case of small-pox has as yet occurred amongst Irish paupers removed from England under warrant, but the disease has since the date of the above communication been introduced into Ireland from England.

A woman, named Elizabeth Coles, left Manchester, with her husband and child, in July, 1876, and arrived in Dublin on the following day. She was visited by one of the medical officers of the South Dublin Dispensary District, and was found to be suffering from small-pox, and was then removed to Sir Patrick Dun's Hospital.

Since this date several other cases of small-pox have been introduced into various localities in this country from England, but owing to prompt precautionary measures which were adopted, and to the efficient manner in which vaccination had hitherto been conducted in Ireland, the disease spread to a very limited extent.

However, the introduction of small-pox into Ireland from England shows how well-grounded was the apprehension on the part of the Irish Local Government Board as to the possible extension of the disease by the removal of paupers under warrant from localities in England in which the disease prevails.

A RICH JEWELLER of Paris, lately deceased, M. Moina, bequeathed £40,000 for the establishment of a hospital for aged and infirm women.

Correspondence.

ASYLUMS FOR INEBRIATES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Some remarks having appeared in the editorial column of your journal on Wednesday, July 18th, 1877, relative to my paper in the *Journal of Psychological Medicine* on "State Medicine in its Relation to Intemperance and the Inebriate," I desire to correct the error relative to my opinions which are quoted.

In my writings upon the subject of inebriety I have always endeavoured to carefully distinguish between the dipsomaniac or inebriate, who labours under an uncontrollable and intermittent impulse to take alcoholic stimulants, and the *physiological state* in which the individual merely chooses to indulge in liquor to excess. Habitual drunkenness, *per se*, I *do not* regard either as a physical disease or as a type of insanity. The result—*intemperance*—is the same in both cases, the two *states* or *conditions* widely different. When speaking of inebriates, I do not mean habitual drunkards. The great diagnostic point attending the *disease*, is the *irresistible impulse* by which the patient is impelled to gratify his morbid propensity, being, during the paroxysm, blind to all the higher emotions, and pursuing a course against which reason and conscience alike rebel. Between these paroxysms the inebriate or dipsomaniac is different from a confirmed drunkard in oftentimes disliking exceedingly all stimulants, and is then a useful member of society. As a result of the law of hereditary transmission we find three divisions in inebriety or dipsomania, which we fail to find in drunkenness as a vice. First, a predisposition or simple aptitude, the result of a defective organisation and a weakened or diseased nervous system, as a result of which the possessor is predisposed or has a tendency to seek for the relief obtained by alcoholic stimulants when labouring under physical or mental depression; second, in the latent state or germ of the disease; and third, in the actually developed disease. In both insanity and dipsomania we are dealing with abnormal cerebration; in the one case associated with mania, melancholia, dementia, and idiocy; and in the other, with a depraved alcoholic appetite,—an irresistible impulse, which the mind seems powerless to control; an *insane impulse*, just as surely as a homicidal or a suicidal impulse is an insane impulse. I think that when our cerebral pathology, which is as yet in its infancy, becomes more generally understood, it will be found equally applicable to this as to other forms of insanity. The terrible insane craving for alcoholic stimulants is often the result of a lowered vitality or abnormal organic development of the nervous system, that has descended from generation to generation, gaining in intensity until it manifests itself by the complete loss of self-control, and active inebriety in children and grandchildren after they once taste intoxicating liquors and indulge in them. The blunted moral perception which so many inebriates exhibit, and which renders them peculiarly liable to a relapse after they leave an asylum, is to be regarded in the same light, I think, as the perverted moral sense in moral insanity. In every institution for the insane we find inmates who exhibit no obvious intellectual aberration or impairment, the *moral* faculties being deranged, while the *intellectual* faculties remain apparently in their normal condition. The manifestation of moral insanity may be a simple perversion of some sentiment or propensity, under certain exciting causes, and I think this exactly comprehends cases of inebriety or dipsomania with loss of self-control and perversion of moral nature. The person of course, is aware that the act is wrong in both instances, but the control which the intellect exercises over the moral sense is overborne by the superior force derived from disease. I have been told many times, by both insane patients and inebriates, that the feeling on the one hand to commit some insane deed and on the other to give way to alcoholic appetite was contemplated in both instances with horror and disgust, and at first successfully resisted, until at last, having steadily increased in strength, it bore down all opposition. What can be a more powerful argument in favour of the disease theory of inebriety? That inebriety or dipsomania is both a physical disease and a type of insanity is proved by cerebral pathology, the fundamental principle of which is, that healthy mental function is dependent upon the proper nutrition, stimulation and repose of the brain, and upon the processes of waste and reparation being regularly and properly maintained. We know that the cerebral cells are nourished by the proper and due supply of nutritive plasma from the blood, and that this is essential to healthy function; and, indeed, the ultimate condition of mind with which we are now acquainted, consists in the due nutrition, growth and renovation of the brain cells. If now, we take into the system an amount of alcohol that causes the blood-plasma to convey to the brain-cells a noxious and poisonous, in place of a nutritive substance, stimulating the cells so as to hasten the process of decay and waste, beyond the power of reparation and renovation and impressing a pathological state on them, we must inevitably have resulting a change of healthy function and disease induced. We have a change in the chemical composition of the cerebral cells from the standard of health, which is the foundation of organic disease, as it interrupts healthy function. The sym-

ptoms of cerebral irritation manifested in inebriates are due to increased excitability of the nerve-filaments and ganglion cells of the brain, while the symptoms of exhaustion and depression occurring at a later stage are due to lost excitability of the nerve-filaments and ganglion-cells of the brain. With regard to my views respecting the compulsory detention of inebriates which are criticised as a measure which the profession would never think of recommending, and a measure to which the public would always entertain the greatest aversion," I beg to reply, that some of the highest professional gentlemen in this country have publicly commended them, and that they are supported by such men as Dr. Alexander Peddie, Dr. Austin Flint, sen., Dr. Millard Parker, and Dr. Thomas B. Christie, and that if the public do not appreciate the necessity of sending their friends or relatives where they may be cured, by compulsion, if necessary, while in an early and curable stage of inebriety, they do not understand their own interests. The question of the compulsory control of habitual drunkards I leave entirely out of the question. I am dealing with a *disease* and would never allow the wards of an inebriate hospital to be cumbered up with confirmed sots. I am dealing with a class of patients who I do not propose to treat as "lunatics," except so far as the fact of retaining them until their broken down nervous system and shattered constitutions are restored and built up, and sufficient mental and physical stamina are given, and will-power enough to resist the force of morbid impulses; and I speak from personal experience when I say that such places can be rendered attractive and homelike, so that both ladies and gentlemen will be equally as happy and contented as when in their own homes. Please favour me by giving this a place in your valuable journal, and oblige Yours respectfully,

EDWARD C. MANN, M.D.

New York City, July 31, 1877.

THE USE OF ARTIFICIAL SALINE WATERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the April number of the *Practitioner*, Dr. Wade, "On the Use of Weak Solutions of Saline Drugs," remarks that "if we give two scruples each of sulphate of soda and sulphate of magnesia, we put them into an ounce, or an ounce-and-a-half of water. Nature at Friedrichshall puts them into 16 ounces." Here there is a very material difference between artificial and natural prescriptions, and there is no doubt if we study the composition and action of mineral waters, we may not only get many wrinkles on prescribing, and make pretty exact imitations, but also in some measure, simplify and improve on nature by the addition or omission of some ingredients as circumstances would require. For instance, at my instigation, some of my medical friends have used the following mixture where the bitter saline purgative waters of Friedrichshall and Hunyadi Janos were indicated with equal, if not more satisfactory, results in abdominal diseases, hepatic congestion, even attended with hæmorrhoids, plethora, &c. :—

℞ Sulphatis sodæ;
Sulphatis potassæ, āā ℥iij.;
Sulphatis magnesiæ, ℥iv.;
Bicarb. sodæ, ℥j.;
Bicarb. potassæ, ℈j.;
Aquæ fontanæ, ℥xx.

Solve et adde acid muriatic diluti, ℥j. Signatur.—The bottle to be kept well corked and in a cool place.

A wine-glassful the first thing every morning in a tumbler of cold water. The addition of the muriatic acid answers a two-fold purpose, it saturates the mixture with carbonic acid gas, making it more palatable, and the small quantities chlorides it generates adds to its efficacy in a surprising way. Sulphate of potass is the best cholagogue in the saline shape, and invariably enters largely into all the natural waters of use in hepatic congestion. But all the natural waters contain, more or less, sulphate of lime (in common *parlance* plaster of Paris), which adds nothing to their efficacy and is objectionable.

Again, in gouty and rheumatic diatheses where an iodized alkaline aperient is indicated, the following may be prescribed, and will be found far more efficacious than any of the natural waters :—

℞ Sodæ sulph. sicc., ℥iij.;
Potassæ sulph. sicc., ℥vj.;
Potassæ bicarb., ℥ijss;
Carb. lithiæ;
Iodidi potassii, āā., ℥ss.

℔. Et fiat pulvis. Capiat cochleare parvum summo mane ex aquæ tepidæ Oss.

If the patient prefer cold to tepid water, plain cold or aërated may be used.

In renal affections, where a course of the warm alkaline waters of Vichy or Carlsbad, or the cold ones of Vals, Jachingen, and Marienbad is desired, we may use (as Dr. Wade suggests) dilute solutions of potass and soda bicarbonate with citrate of lithia. Sir H. Page has found soft or distilled water of great service in the palliative treatment of renal affections, and either the one or the other should always be used in the preparation of the solutions. They may be taken warm, or surcharged with carbonic acid.

By adopting such measures as these, we can confer, in some measure, the boon of mineral waters on the poor patient, which is now only enjoyed by the wealthy.

I am, sir, yours, &c.,

J. H. W.

NEWSPAPER MEDICAL RIVALRY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your Special Correspondent has omitted the discussion on Dr. Haddon's motion at the British Medical Association, but I may tell you there was a very strong feeling against the *Journal* being used for the personal quarrels of the editor, and I think the editor has received a hint for the future which he will not forget.

I must thank you for your editorial, and for your long notice of the whole proceedings.

Yours faithfully,

Manchester, Aug. 17. A MEMBER.

"THE HOMŒOPATHIC SCHISM."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your last number you say—"Dr. Wyld resorts to the *frequent* use of aperients." The expression I used in my letter to Dr. Richardson was—We *occasionally* used aperients. As this is an indefinite term, I may now add that I do not perhaps prescribe aperients more than ten times in a year. I have not myself taken an aperient for 31 years, and not one of my six children, the eldest being 23, has ever enjoyed that privilege! This is a marvellous change from the usages of my childhood when periodic aperients were considered essential to the salvation of man.

You say Dr. Wyld's well-meaning proposition (for mutual tolerance) is chimerical as shown by Dr. Bayes' inimical letter in the *Homœopathic Review*.

The fact would appear to be that Dr. Bayes represents sectarian homœopathy, and I represent broad and progressive homœopathy, and if I may judge by recent voting at our society, progressive homœopathy would appear to be in the ascendant.

The following form of resolution has recently been signed by nearly all our leading men—indeed, all have signed it to whom I have applied personally—and several of the leading men on your side have said to me—"Nothing could possibly be better than your form of motion, and if it represents the views of the homœopathic body we see no reason why a perfectly free interchange of professional courtesies should not at once be established."

This is all I desire, and as you have ventured on a prophecy, perhaps you will permit me also to prophesy. That within three years of this date the profession at Birmingham, Manchester and Liverpool will declare their willingness to meet any medical men, irrespective of theories, and that London will follow the free trade example of the North within five years of this date.

Form of Resolution meant to be signed by both parties.

"We, the undersigned, believing that medicine is a progressive art and science, hold that any qualified medical man is at liberty to adopt any theory or practice which seems to

him best for his patients. Therefore the adoption of any theory or practice should not exclude any qualified medical man from the freest professional intercourse, provided he does not trade on a distinctiv ename nor unprofessionally advertise his mode of practice."

These are abstract propositions which all could sign, and yet they involve the entire question. If agreed to at a a forthcoming conference, homœopathy, *as a schism*, is extinguished.

GEORGE WYLD, M.D.

12 Great Cumberland Place, Hyde Park.
10th August, 1877.

SCIENTIFIC GRANTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—The awards made by the Scientific Grant Committee of the British Medical Association amount only to the small sum of £300, and this certainly seems to me a very small contribution out of the large income of the society.

It was said by Dr. Bartholomé that the profession does not receive much encouragement from the outer world, but it also seems that its scientific exertions receive only a small modicum of support from within.

If the *Journal* absorbs £7,000 it is a great waste of money, for I should imagine from the advertisements it ought to be like other journals—self-supporting.

It is well we have such thoroughly earnest workers as Drs. Vacher and Braidwood, for their remuneration is sadly too little for the work they have done.

Yours truly,

August 17, 1877. INQUIRY.

DR. STOKES ON THE FUTURE OF THE BRITISH MEDICAL ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—From the tone of your leader you differ with Dr. Stokes on the proper work of this Association, and as his remarks have a bearing on internal medical reform, I think they are worth reviving.

In his valedictory address at Oxford, 1868, he said in reference to the Association. "Its durability and usefulness will depend on its being made the instrument for the public good, rather than the machinery to advance the immediate worldly interests of the profession. The man among us who by his unselfish labour adds one useful fact to the storehouse of medical knowledge, does more to advance its material interests, than if he had spent a life in the pursuit of medical politics."

"Far be it from me to say there are not great wrongs to be redressed. But these evils being admitted, how are they to be lessened, if not removed? Is it by public agitation and remonstrance addressed to deafened or unwilling ears? or is it by the demand for class legislation? or is it by the efforts of one and all to place medicine in the hierarchy of the sciences, in the vanguard of human progress; eliminating every influence that can lower it; every day more and more developing the professional principle, while we foster all things that relate to its moral, literary, or scientific character. When this becomes our rule of practice, then begins the real reform of all those things, at which we fret and chafe. Then will medicine have its due weight in the council of the country. When medicine is in a position to command respect, be sure that its rewards will be proportionally increased, and its status elevated."

These words are worth pondering on, and as you have done so much to enforce professional honour, you may deem them worthy of insertion, even though not in accordance with some of your views.

Yours truly,

HIBERNICUS.

August 19th, 1877.

DURING the week ending the 13th August, 5,357 births and 3,204 deaths were registered in London and twenty-two of the large towns of the United Kingdom.

Literature.

LECTURES ON SURGICAL PATHOLOGY AND THERAPEUTICS. (a)

WHEN a course of lectures treating on the subject of surgical pathology and therapeutics reaches its eighth edition there is good reason to believe such lectures have been well appreciated, particularly when it is known that they were delivered by a surgeon whose skill and practical experience as a lecturer and hospital teacher affords sufficient guarantee that the principles laid down can be thoroughly trusted.

In the first volume we find the various subjects treated were delivered in twenty-three lectures; these, again, are divided in twelve chapters, 438 pages in all, and are illustrated with something over seventy woodcuts, which we think might be a little clearer. However, the work has been exceedingly well and freely translated, the style is simple and most intelligible, and we give the translator every credit for the manner in which he has accomplished his task. We have carefully read through the work, and we cannot say we see anything particularly new, but we find that Billroth seems to be *au courant* with the surgery of all countries; he may omit certain matters found in other works, but makes up for it by slight introductions of his own, and fully acknowledges the labours of fellow-workers in the sister countries.

In Lecture I. he speaks of the relation medicine has to surgery, and believes that it is hard to separate them. At page 3 he says, however, "One thing alone is required of the pure surgeon more than of the pure physician—the art of operating," He then gives a very full historical sketch of the rise and progress of medicine and surgery from the earliest times down to the present. He also enlarges on the method of study pursued at the various German universities, and concludes his first lecture by urging on his class the value of perseverance, continued industry, and, above all, note-taking.

Lecture II. commences with the consideration of "Simple Incised Wounds of the Soft Parts." As regards the means he uses to produce anæsthesia in surgical operations, he mentions that he is aware that ether has been greatly used lately in preference to chloroform, owing to the great number of deaths that have occurred within the last ten years. Billroth says, however, "at present I use exclusively, as an anæsthetic, a mixture of three parts of chloroform with one part of sulphuric ether and one part of absolute alcohol, and I have an impression that the narcotism produced is less dangerous than that from chloroform alone." In the latter observation we perfectly agree, but feel that ether alone is a still better and safer anæsthetic.

At page 58, when speaking of wounds of the hairy scalp, he mentions, in such a situation we are told never to apply sutures; this is a good rule, he intimates, but in some exceptional cases he thinks you might apply them, and says, "There are articles of faith of this kind handed down from teacher to pupil, from one handbook to another; many of them are a sort of Hippocratic tradition full of practical truth; these I willingly respect; others are based on undetermined observation and prejudices founded thereupon, and among these latter I class the prohibition to apply sutures to wounds of the head."

In the seventh lecture we have a remarkably clear description of ulceration, granulation, and cicatrisation, in fact, clearer than we have seen in most books. As regards the dressing of wounds, Billroth does not appear to be an enthusiastic admirer of the antiseptic method of Lister in its integrity, although he approves of it; at the same time he mentions his experience in this method is not great, but

(a) "Lectures on Surgical Pathology and Therapeutics. A Handbook for Students and Practitioners." By Dr. Theodor Billroth, Professor of Surgery to the University of Vienna. Translated from the Eighth Edition. Vol. I. Published by the New Sydenham Society. 1877.

from what he knows of it, he feels bound to recommend it, feeling, at the same time, that cleanliness is the great point in favour of the antiseptic method. When talking of unreduced dislocation, Billroth mentions that half-an-hour should be the maximum time observed for an attempt of any one method at reduction in such cases. When speaking of gangrene of the extremities, he recommends the propriety of waiting for a line of demarcation before operating.

In conclusion, we recommend this volume to the careful consideration of senior students and young practitioners, feeling sure the perusal of such a work will add pleasure and profit to the reader.

DISEASES OF THE HEART. (a)

This system of medicine is so well known, and has been so favourably received by the profession, that the appearauce of this fourth volume will be very acceptable. It has long been expected, and the delay in its appearance has been chafing to many readers. They will, however, find in this volume much that will gratify them, especially if interested in pericarditis. The papers of the late Dr. Sibson on the "Position of the Heart," "On Pericarditis and Endocarditis," are the most exhaustive articles we ever remember seeing, and are really monographs on the subjects. The thorough and painstaking method of working adopted by Dr. Sibson is well known, and specially so by those who were familiar with him in the wards of St. Mary's Hospital. His bright genial presence used to inspire in others the enthusiasm which he himself felt in his work; and these articles of his will form to many a memorial, and a fitting one, of their old teacher.

The other articles are all of great merit, and are by eminent writers. The first on "The Size and Weight of the Heart," is from the pen of Dr. Peacock, who also contributes the articles on "Lateral or Partial Aneurism of the heart and Adventitious Products in the Heart." They are accurate, concise, and brief, but full of information. Osseous degeneration he describes as being associated with the development of connective tissue either under the pericardium or in the muscular structure of the heart. "Such formations are not, however, to be regarded as truly bony, though they may be very hard, thick, and of large size. They consist, indeed, only of granules of calcareous matter deposited in the altered tissue, without any of the elements of bone structure." The ossification of the heart, so much spoken of by older writers, seems less familiar to the present generation. They recognise the fact that the valves, and especially the aortic valves, when undergoing chronic inflammatory change, are often the seat of a deposit of lime salts, and that a calcification of the valves is thus brought about. They also are aware that a similar deposit of lime salts may take place in the indurated tissues under a thickened pericardium, but they do not find, as Burns did, "the ventricles perfectly ossified, so as to resemble the bones of the cranium," nor in the present state of our knowlege is such a state of matters conceivable.

Dr. Sibson devotes 95 pages to the normal position and form of the heart and great vessels, and leaves nothing more to be said on the subject, at present at least. His material for the essay on pericarditis is derived from the cases which came under his care during fifteen years at St. Mary's Hospital, and is, as might be expected, so large as to be embarrassing, even to Dr. Sibson himself. The elaborate pains which he has bestowed upon it fails to arrange it in such a form and order as makes it readily intelligible to the casual reader; but this article will ever remain a storehouse of facts for future writers on this subject, the lengthy article on pericarditis extending over 240 pages. This article contains long tables, in which, for the sake of brevity, symbols are used profusely, which makes them hard reading. One symbol resembles a coffin, but it evidently is not intended to indicate that the patient died, for it is found under circumstances which preclude that interpretation. What it means we have not yet succeeded in discovering. Endocarditis does not occupy so many pages, and is a good article.

Hydropericardium and pneumopericardium are by the late lamented Warburton Begbie, and though brief are excellent.

The article on angina pectoris and allied states, including certain kinds of sudden death, is by W. T. Gairdner, of Glasgow. It is learned, accurate, and interesting, and contains the most recent views on this malady, as well as a *résumé* of older views. Most readers will read this essay with pleasure and profit.

Dr. Hilton Fagge contributes the article on the "Diseases of the Valves of the Heart." Dr. Fagge is a pathologist of repute, and is known to have devoted much attention to the diseases of the heart, as this piece of solid work testifies amply. In speaking of the prognosis of these affections, he says, "There is no doubt that thirty years ago the most practised auscultators of the day condemned, as the victims of organic valvular disease that would soon destroy them, children who have since grown up to be men and women, and who, to all appearance, enjoy excellent health." This statement is made when considering the point of how far inflamed valves can recover their normal structure and function. He agrees with Jaksch that when one flap or cusp of a valve becomes diseased compensatory enlargement of the other cusps or flaps may take place, but such change is confined to young subjects. The remarks on treatment are sound and judicious.

The affections of the walls of the heart are by Dr. W. R. Gowers, a very rising physician, and ought to enhance his reputation very decidedly. Atrophy, hypertrophy, dilatation, fatty diseases, and fibroid disease of the heart are all from his pen. Here the reader will find all that is yet known on these interesting topics put in good array and order. Dr. Gowers is well read in the literature of these maladies, and has also evidently observed closely.

We must conclude this notice by saying that these last articles are quite worthy of the whole work; and further, that this volume is quite equal to its predecessors.

CLINICAL STUDIES ILLUSTRATED BY CASES OBSERVED IN HOSPITAL AND PRIVATE PRACTICE. (a)

These two volumes contain the different essays and articles Sir John Rose Cormack has contributed to the literature of his profession from time to time. Some of the earlier writings, such as his inauguration thesis for the University of Edinburgh on "The Presence of Air in the Organs of the Circulation," have a permanent value. But the essay on "The Epidemic Fever in Edinburgh in 1843," will, at this lapse of time, have little interest, except for those who are writing on the history of our views on fever. Many of the essays are interesting and instructive to the general reader, while his views on croup and its relation to diphtheria are specially interesting. Diphtheria is a disease, croup is a symptom of various laryngeal affections, he states. The different papers are on very various subjects, but they all indicate that the writer has not allowed his extensive and unusual opportunities for observation to escape him, but that he

has availed himself of them. Some of the papers are worthy of careful perusal, and furnish information on subjects not generally known, and which, indeed, could only be so written upon by one who has had the peculiar experience of the writer.

LIST OF HOSPITALS AND ASYLUMS FOR IDIOTS AND IMBECILES IN GREAT BRITAIN, AUSTRALIA, CANADA, AMERICA, GERMANY, FRANCE, BELGIUM, AUSTRIA, SWEDEN, DENMARK, AND RUSSIA.

The following figures of M. Ireland, translated from *Le Progrés Medical*, will prove interesting to the statistician who may desire to compare the relative number of afflicted persons in different countries, and the accommodation provided for their comfort and treatment. Of late years, the efforts of philanthropists have been directed to the amelioration of the condition especially of idiots, and experiments have proved that they are capable of receiving instruction, and of developing their faculties.

Vaselin.

H. A. Du Bois, M.D., San Rafael, Cal., expresses himself strongly in favour of vaselin as a topical application, either alone or in combination with other remedies, in a great variety of affections. According to Dr. Du Bois, its range of usefulness—both as a remedy by itself, and as a base capable of entering into combination with other substances—is very wide indeed. In ulcerations of the septum of the nose he has experienced great benefit in treating such cases locally, with an ointment composed of five grains of salicylic acid, added to an ounce of vaselin; the one-hundredth to one-fiftieth of a grain of corrosive sublimate, with some preparation of iron, being at the same time administered internally twice daily.

After a few months, this plan of treatment is usually effective in securing a complete cure.

In cases of scrofulous enlargements of the glands of the neck, vaselin, with from ten to twenty grains of iodine and the same quantity of iodide of potassium makes an excellent ointment. In hæmorrhoids, vaselin, with five to ten drops of tar to the ounce, makes a very soothing application to the inflamed piles. Ten to twenty grains of the subnitrate of bismuth may be substituted in some cases for the tar with advantage; the portal system must at the same time be kept unobstructed.

In granular lids, he has found that vaselin alone, introduced into the eye, soothes the parts and has obtained very good results. Alum, sulphate of zinc, or liq. ferri perchloridi may be added, if desired.

In purulent ophthalmia, vaselin, with one-half to three grains of salicylic acid to the ounce, has proved useful.

In otorrhœa in scrofulous children, the vaselin, with varying proportions of salicylic acid, checks the discharge and relieves all excoriations caused by it.

Dr. Du Bois found it exceedingly useful as an application to the whole surface of the body, in the case of a child suffering from small-pox, who was naturally of a very irritable disposition, but in whom it entirely relieved the itching—so much so, that not a single pustule was broken by scratching, nor a mark left after convalescence. The secondary fever attendant upon the maturation of the pustules was also absent. It should be applied daily, or oftener.

It is more useful than carron oil in the treatment of burns, it stimulates the granulations to a healthy action, and, in combination with astringents, is useful in all stages of the treatment of an extensive burn.

He recommends it also as a dressing in the treatment of chancroids.

In cases of baldness or loss of hair after fevers, vaselin, with twenty grains of quinine and thirty drops of tincture of cantharides, makes an excellent pomatum. It may be used with very good effect as an external application, instead of cod-liver oil, in diseases of malassimilation. It is a useful and soothing application in dressing blisters; added to poultices, it keeps them moist and (if a little salicylic acid be added) sweet for a length of time. It is a good vehicle for active medicine when used by the rectum. The vaselin should be slightly warmed, and the nozzle of the syringe large. If introduced in the melted state into the urethra, in cases of difficult strictures, it enables the catheter to enter with facility.

It answers well, either alone or in combination with tannic acid, as an application to bed-sores. In fact, he has found it useful under a great variety of circumstances.—*New York Medical Record*, April 21st, p. 244.

Small-pox and Diphtheria in Persia.

Late foreign exchanges say that diphtheria has existed for two years in Persia, and has lately shown itself in unexpected severity; in Shiraz the disease has become almost endemic. With slight variations in intensity it has prevailed the whole year through, and has already cut off nearly all the children. The devastation caused by small-pox in Persia is terrible; vaccination is almost unknown, and is considered a sin. In Ispahan, since December last, 760 persons have been attacked, of whom only thirty recovered, and none of them have escaped without blindness or the loss of one or other of their limbs. In Astrabad, on the Caspian Sea, fifty persons are at the present time dying daily, of small-pox.

Treatment of Migraine.

According to M. Hervez, of Chégoin, migraine is an arterial neurosis which takes its origin in the great sympathetic nerve, and its seat is in the nervous filaments which accompany the arteries, whilst it manifests itself in the dilatation of these vessels and in the compression of the brain and other organs it produces. The treatment of migraine consists in combating the tendency to periodicity, the pain and the arterial dilatation. M. Hervez finds the following prescription of essential value in fulfilling those indications. He gives every day one pill containing about one grain of sulphate of quinine, one grain of tannic acid, and a seventy-fifth of a grain of aconitina. The dose may easily be increased to three or four such pills daily.

On Suicide.

At the last meeting of the Association of Superintendents of Asylums for the Insane, an interesting paper on "Suicides" was read by Dr. Gray, of the Utica (N. Y.) Asylum, in which he took the ground that while suicide is an unnatural act, it is not necessarily an evidence of insanity.

Dr. Vincent Richards, of Bengal, states that the testimony of medical officers in India goes to show that high temperature has great influence in determining the number of suicides in any given year. The majority of suicides are, he says, committed "during a state of mental excitement—in fact, impulsively—when the nerves are, so to speak, strung to the highest pitch of irritability; even those of the most phlegmatic temperament must have experienced the comparatively irritating effect of the hot weather months."

Flower Barometer.

The latest novelty in the French capital is a simple artificial flower in fine cotton imitating a rose, daisy, hyacinth, or other flower, the petals of which are impregnated with a chemical solution which has sensitive properties, and changes colour as the weather is fair or otherwise. In fine weather the flower is blue, in changing weather lilac, and in bad weather pink. This interesting novelty is the invention of a leading scientific man in France, who attached no commercial value whatever to it, and communicated the discovery to a speculator for £20, who afterwards sold it for £120, and it was again transferred to the parties who are actually making a fortune out of it for the sum of £200. These flowers are mounted up in pretty little vases with a suitable surrounding of artificial leaves, moss, &c., and are sold readily at from two to three francs each.

In the year 1876 there were 5,467 suicides in France, of which 109 were by poisoning. The poison used was generally laudanum.

Stone Butter.

The quarrymen and miners of parts of Germany are in the habit of spreading on their bread a fine unctuous clay found in the crevices of the rocks, which they call "stone butter," and eat with apparent relish.

A New Anti-epileptic.

Professor Xavier Landerer, of Athens, states in the *Pharmaceutical Journal* that he has been able to recognise in a substance that has locally acquired some reputation as a remedy against epilepsy, the root of the *Clematis cirrhosa* or *sylvestris*. In two cases of epilepsy treated with a decoction of this root, which is strongly diuretic, there has been a cessation of the attacks for more than three months. The bruised fresh leaves of the plant act as a rubefacient, and sometimes even as a vesicant when applied to tender parts of the skin.

An Error in Diagnosis.—The following excerpt taken from the *Australian Medical Journal*, into which it was copied from the *Maryborough and Dunolly Advertiser*,

"Si non e vero e ben trovato"

It reads however very doubtfully as to the truth of the facts recorded :—

"It was reported to the physician of one of our Melbourne hospitals the other day, that there was a man lying in one of the wards in a comatose condition. The nurse declared that he had been insensible for twenty-four hours, and she had tried in vain to rouse him. The doctor said that it was probable that the patient was under the influence of some powerful narcotic; perhaps he had taken a large dose of laudanum. He said it was imperatively necessary that the unfortunate man should be resuscitated at once by some powerful stimulant. Accordingly he directed two of his assistants to take a strong galvanic battery, while the nurse stopped for a few moments in the laundry. When they reached the man's bedside, they placed the battery on the floor, and, baring the patient's ankle, they wrapped the wire around it. When everything was ready they turned on the current full head. A second later the prostrate form

of the patient bounded about four feet in the air, and as it came down upon the bed, a second shock sent it up again, the patient meantime exclaiming, 'Oh, murder, murder-r-r-r-r! Grashus! Let up on that. Another one of them'll kill me! O merciful Moses! Dont do that again." When he came down the fourth time the doctors turned off the current, with the remark that they thought that would be about enough. Then one of them asked the patient how he felt, and attempted to feel his pulse. But the patient, furious with rage, said, 'You diabolical scoundrel, what d'ye mean by hitching that thing to me in that manner, say?' 'Now, be calm,' said the doctor, 'it's all right, you'll be better directly.' 'But it isn't all right. I've a mind to knock your head off for blowing me up with that infernal machine. What d'you do it for, anyway?' 'My friend, don't excite yourself,' said the doctor, 'you've been in a very bad way, and we ran the current through you to bring you back to life.' 'Bring me back to life! Why, you must be crazy. Back to life! I was no more dead than you were.' 'Now, keep cool. You have been unconscious for twenty-four hours. Narcotic poisoning, no doubt. We have saved you from an early grave. It was the closest shave. It was, upon my honour.' 'Well, well, if this don't beat all the——. You took me for the man in ward 3. Why, I'm one of the new wardsmen, and I lay down on this bed for a nap. The fellow you're after is over yonder. An early grave! Well, now I have heard foolishness in my life, but this takes the rag right off. And I give you warnin' that if you come about yer with that apparatus again, trying experiments on me, I'll wrench your brain-pan for you.' Then the doctor moved off in search of the right man, while the keeper went out to hunt a dog to kick in order to relieve his feelings."

NOTICES TO CORRESPONDENTS.

Notice to Subscribers.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in London, Dublin, or Edinburgh.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Dr. O. F.,—We cannot insert discussions on religious questions.

Dr. J. Griffith.—The clinical record of a "Case of Puerperal Mania" will be inserted probably next week.

Dr. Drysdale.—We cannot insert further correspondence on the subject of the "Fruits of Philosophy."

X. Y.—The guardians are not bound to pay the substitute of a sick dispensary doctor unless they have made a contract with the said substitute to do the work, but they *must* pay him if the doctor sticks to the strict letter of the law. According to Article 22 of the Dispensary Regulations "If a medical officer of a dispensary district be temporarily incapacitated, by illness or other cause, from performing his duties, he shall immediately, if practicable, communicate with the chairman or honorary secretary of the committee, and shall recommend to the committee a medical practitioner qualified as hereinbefore provided, to perform his duties during such temporary incapacity. And on the fact of the medical officer's incapacity becoming known, a special meeting of the committee shall be at once called, in accordance with Article 13 of this order, for the purpose of appointing a temporary substitute for the medical officer; and the committee shall report the circumstances of the case to the Board of Guardians, who shall, subject to the approval of the Commissioners, determine the amount of remuneration, if any, to be paid to the temporary substitute." Under this rule the medical officer is perfectly protected, and he is rightly served if he finds himself obliged to pay the substitute himself. His simple course is to notify his incapacity for duty to the hon. sec. of his committee, sending, if he sees fit, his medical certificate and nominating a fit person, no matter who, to do the duty. He should, at the same time, inform his nominee that he had recommended his appointment as *locum tenens*, but would not be responsible for any payment. The committee may or may not appoint such nominee, but if they do so, and he be fool enough to act without a distinct understanding as to fees, they need not pay him at all. The course before the medical officer is perfectly simple, and, under such circumstances, it disgusts us to read an abject letter addressed to the Gorey Guardians by a medical officer last week. The officer says, "It is now many years since I put the board to any expense in consequence of ill-health. I would now *take it as a great favour* if the board would sanction the usual payment to Dr. —— for an additional week; I have been ordered salt-water baths, and wish to go to Courtown for the purpose." This was the second begging petition of the doctor, the former one having been rejected.

Epitaph written upon the tomb-stone of an old cat belonging to the family of a first-course medical student:—

Here lies, in her bed longitudinous,
The mother of kits multitudinous.
Her life—a perspicous history:
Her death—an insuperable mystery,
With causes profound and specific
To puzzle the unscientific.
If her rustic physicians—odd rot 'em!—
Had given poor puss a post-mortem.
Who knows but the innocent cusses
Might have found that she died of pertussis;
Or haply of intussusception,
The result of too frequent conception;
Or a uterine subinvolution,
Of abortion the fitting conclusion?
It may have been struma or phthisis,
Or coma, asphyxia, emesis;
Or mayhap a stone in her bladder was
The agent that made her cadaverous.
But enough for her fatal pathology,
She made a success of biology;
And if she was weak in psychology,
We stop not to offer apology,
But resign her cold clay to geology.
Sleep, mother of kits multitudinous,
In peace in thy bed longitudinous.
We joy in thy prolific history;
We mourn thy cadaverous mystery.

—*Louisville Med. News.*

VACANCIES.

Killala Union Workhouse.—Medical Officer. Salary, £50. Election, Sept. 1.

Killala Union, Killala Dispensary.—Medical Officer. Salary, £80. Election, Sept. 1.

Queenstown Dispensary.—Resident Apothecary. Salary, £70 per annum, with perquisites amounting to £45. Election, Aug. 29.

Waterford Union, Ullid Dispensary.—Medical Officer. Salary, £120 per annum. Election, Aug. 30,

APPOINTMENTS.

Barlow, T., M.D., M.R.C.P.L., an Assistant Physician to the London Hospital.

Carruthers, W., M.R.C.S.E., L.S.A.L., reappointed Medical Officer of Health for the Halton Sub-District of the Runcorn Rural Sanitary District.

Fox, A. E. W., M.B., C.M., Medical Officer to St. Catherine's and Bellott's Hospitals.

George, W. H., L.R.C.P.Ed., L.F.P.S.G., Junior Assistant Medical Officer to the Metropolitan Asylum District Asylum for Imbeciles, Leavesden.

Kempe, J. A., L.R.C.P.L., M.R.C.S.E., Senior House Surgeon to the Hospital for Sick Children, Great Ormond Street.

Morgan, T. C., late Surgeon to the Royal Eye Hospital, Manchester, has been appointed Hon. Surgeon to the Sydney Infirmary.

O'Meara, T., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer of Health for the Newbold and Dunston Urban Sanitary District, Derbyshire.

Ridley, J. H. W., M.R.C.S.E., Medical Superintendent of the Dunston Lodge Lunatic Asylum, near Gateshead-on-Tyne.

Weaver, F. P., M.D., M.R.C.S.E., L.S.A.L., reappointed Medical Officer of Health for the Frodsham Sub-District of the Runcorn Rural Sanitary District.

Willett, J., M.R.C.S.E., L.S.A.L., reappointed Medical Officer of Health for the Budworth Sub-District of the Runcorn Rural Sanitary District.

Births.

Fitzgibbon.—Aug. 16, the wife of Henry Fitzgibbon, M.D., of a son.
Magee.—Aug. 13, at Kilkenny, the wife of Dr. Magee, of a son.

Marriage.

Spencer—Savory.—Aug. 15, at St. Mary's, Wendover, Edward Richard Spencer, of Albion Road, Stoke Newington (son of the late Thomas B. Spencer, of Keyston, Hunts), to Isabella, youngest daughter of the late Joseph Thomas Savory, Surgeon, Wendover, Bucks.

Deaths.

Bowie.—On Aug. 8, found dead in bed at Jarrat Street, York, Robert Bowie, M.R.C.S.E., aged 43.

Copland.—On Aug. 18, at 87 Ladbroke Grove, Notting Hill, Maria Annie, the eldest daughter of James Charlesworth Copland, Surgeon, aged 13.

Hamilton.—On Aug. 11, at St. George's House, Chorley, Lancaster, Edward Palmer Hamilton, M.D., L.R.C.S.I.

Hill.—On Aug. 12, at Barton House, Openshaw, Philip Hulme Hill, L.F.P.S.G., aged 44.

Macdougall.—On Aug. 9, at Birkenhead, William James Macdougall, M.R.C.S.E., aged 56.

Ridsdale.—On Aug. 6, at Vane Street, York, William Everard Ridsdale, M.R.C.S.E., aged 39.

Tapp.—On Aug. 3, at Cheltenham, William Denning Tapp, F.R.C.S.E., aged 80.

NORTH-EASTERN HOSPITAL for CHILDREN, HACKNEY ROAD, E.

The post of PHYSICIAN to this Hospital is vacant (consequent upon the lamented decease of Dr. Woodman).

The applications of Candidates (who must be either Fellows or Members of the Royal College of Physicians in London) accompanied by Qualifications and Testimonials, are to be addressed to the undersigned (who will also give full particulars as to the nature and duties of the appointment) on or before the 11th proximo.

ALFRED NIXON, Secretary.

City Office, 27 Clements Lane, E.C.
22nd August, 1877.

UNIVERSITY COLLEGE, LONDON.—The SESSION of the FACULTY of MEDICINE will commence on MONDAY, OCTOBER 1st, 1877. Introductory Lecture at 3 P.M., by JOHN WILLIAMS, M.D.

LECTURES IN WINTER SESSION.

Medicine—Professor J. Russell Reynolds, M.D., F.R.S.
Human Physiology (including Practical Physiology and Histology)—Professor Burdon-Sanderson, M.D., F.R.S. (Jodrell Professor); Assistant Professor, Mr. Edwd. A. Schäfer.
Chemistry—Professor Williamson, F.R.S.; Assistant Professor, Professor C. Graham, D.Sc.
Anatomy—Professor G. D. Thane
Comparative Anatomy—Professor E. B. Lankester, M.A., F.R.S.
Surgery—Professor Marshall, F.R.S.
Practical Surgery—Professor Berkeley Hill, M.B., F.R.C.S.; Mr. Marcus Beck, M.S., M.B., F.R.C.S.; Mr. A. E. Barker, F.R.C.S.
Dental Surgery—Mr. Ibbetson, F.R.C.S.

LECTURES IN SUMMER SESSION.

Botany—Professor Oliver F.R.S., F.L.S.
Midwifery—Professor Grailly Hewitt M.D.
Medical Jurisprudence—Professor Maudsley, M.D.
Practical Chemistry—Professor Williamson, F.R.S.
Mental Diseases—Lecturer, W. H. O. Sankey, M.D.
Hygiene and Public Health—Professor Corfield, M.A., M.D.
Materia Medica and Therapeutics—Professor Ringer, M.D.
Zoology—Professor E. R. Lankester, M.A., F.R.S.
Operative Surgery—Mr. Marcus Beck, M.S., M.B., F.R.C.S.
Pathological Anatomy—Professor H. Charlton Bastian, M.A., M.D., F.R.S.
Ophthalmic Medicine and Surgery—Professor T. W. Jones, F.R.S.
Analytical Chemistry—Professor Williamson, throughout the Session.

UNIVERSITY COLLEGE HOSPITAL.

Consulting Physician—Walter H. Walshe, M.D., F.R.C.P.
Physicians—Sir W. Jenner, Bart., K.C.B., M.D., F.R.S.; Dr. Reynolds, F.R.S.; Dr. Wilson Fox, F.R.S.; Dr. Ringer; Dr. H. Charlton Bastian, F.R.S.
Obstetric Physician—Dr. Grailly Hewitt.
Physician to the Skin Infirmary—Dr Tilbury Fox
Assistant-Physicians—Dr F. T. Roberts, B.Sc.; Dr W. R. Gowers; Dr G. V. Poore, B.S.
Assistant Obstetric Physician—Dr John Williams
Consulting Surgeons—Mr Richard Quain, F.R.S., Surgeon Extraordinary to the Queen; Mr J. Eric Erichsen, F.R.S., Surgeon Extraordinary to the Queen; Sir Henry Thompson, M.B., Surgeon Extraordinary to the King of the Belgians.
Surgeons—Mr Marshall, F.R.S; Mr Berkeley Hill; Mr Christopher Heath
Assistant-Surgeons—Mr Marcus Beck; Mr A. E. Barker; Mr R. J. Godlee, M.S., M.B., B.A. (temporary)
Ophthalmic Surgeons—Mr Wharton Jones, F.R.S.; Mr J. F. Streatfeild
Dental Surgeon—Mr Ibbetson, F.R.C.S.
Surgical Registrar—Mr A. J. Pepper, M.B., B.S., F.R.C.S.
Assistant Medical Officer in the Skin Department—Dr H. R. Crocker, B.S.
Resident Medical Officer—Mr L. S. Jameson, M.B., B.S.

CLINICAL INSTRUCTION.

Medical Clinical Lectures by Prof. Sir Wm. Jenner, Prof. Reynolds, Prof Grailly Hewitt, and Prof Ringer; also by Dr Wilson Fox, Holme Professor of Clinical Medicine, whose special duty it is to train the Pupils in the practical study of Disease. Dr Roberts and Dr Gowers, the Assistant Professors of Clinical Medicine, also give special instruction in the methods of Physical Diagnosis and of Clinical Observation.

Surgical Clinical Lectures by Mr Heath, Holme Professor of Clinical Surgery, Professor Erichsen, Professor Marshall, Sir Henry Thompson, and Professor B. Hill.

Professor Heath holds weekly Clinical Examinations of the Senior Students; and Messrs. Beck and Barker, the Assistant Teachers of Clinical Surgery, give special instruction to those preparing for examination.

Clinical Lectures on Ophthalmic Cases by Mr. Wharton Jones and Mr. Streatfeild.

Clinical Lectures on Diseases of the Skin by Dr Tilbury Fox.

SCHOLARSHIPS, EXHIBITIONS, AND PRIZES.

Three Entrance Exhibitions, of the respective values of £30, £20, and £10 per annum, tenable for two years.

An Atkinson Morley Scholarship for the promotion of the study of Surgery, £45 a year, tenable for three years.

Sharpey Physiological Scholarship, about £70 a year, tenable for three years.

Filliter Exhibition for proficiency in Pathological Anatomy, £30.

Liston Gold Medal for Clinical Surgery.

Dr. Fellows' Medals for Clinical Medicine, two Gold and two Silver.

Alexander Bruce Gold Medal for Pathology and Surgery.

Cluff Memorial Prize, awarded every other year for proficiency in Anatomy, Physiology, and Chemistry.

The next Examination for the Entrance Exhibitions will be held at the College on the 27th and 28th of September.

Prospectuses and the regulations concerning the Exhibitions and Scholarships may be obtained on application, either personally or by letter at the Office of the College.

GRAILLY HEWITT, M.D., Dean of the Faculty.
TALFOURD ELY, M.A., Secretary.

THE LONDON HOSPITAL and MEDICAL COLLEGE, MILE END, E.

The Session for 1877-78 will commence on MONDAY, OCT. 1st, 1877, when a Conversazione will be held at 8 p.m.

Two Entrance Science Scholarships, value £60 and £40, and Two Buxton Scholarships, value £30 and £20, will be offered for competition at the end of September to new Students. Entries on or before September 20th.

Fee to Lectures and Hospital Practice, 90 guineas in one payment, 100 guineas in three instalments.

All resident and other Hospital Appointments are free.

The resident Appointments consist of Five House Physiciancies, Four House Surgeoncies, One Accoucheurship, also Two Dresserships, and Two Maternity Assistantships.

The London Hospital is now in direct communication by rail and tram with all parts of the Metropolis.

R. KERSHAW, Secretary.

ROYAL FREE HOSPITAL, GRAY'S INN ROAD.—The General Committee of this Hospital have decided that the Honorary Medical Staff shall in future consist of two Physicians, two Surgeons, one Assistant Physician, and one Assistant Surgeon. The present number of beds in the Hospital is over 100: this number will shortly be increased to over 150. The Committee announce that they are ready to receive applications from gentlemen who may be desirous of filling the offices of Assistant Physician and Assistant Surgeon. Five beds each will be allotted to them, and their special duties will be to attend the Out-Patients of the Hospital two days each in every week, when the new buildings are completed. The Assistant Physician must be a Member of the College of Physicians of London, and the Assistant Surgeon a Fellow of the Royal College of Surgeons of England. The election rests solely with the General Committee.

Further particulars may be obtained of Mr. BLYTH, Secretary, at the Hospital.

Candidates are requested to send in their testimonials before the 1st September next. JAMES S. BLYTH, Secretary.

LONDON SCHOOL of HOMŒOPATHY, 52 GREAT ORMOND STREET, RUSSELL SQUARE, W.C.

PRESIDENT.—The Right Hon. Lord Ebury.
BANKERS.—Union Bank of London, Argyll Place.

The WINTER SESSION will open on TUESDAY, OCTOBER 2nd, with an Introductory address at 5 p.m., by Dr. R. HUGHES.

Lectures on Materia Medica and Therapeutics, Dr. RICHARD HUGHES.

On Principles and Practices of Medicine, Dr. D. DYCE BROWN.

Clinical lectures (within the wards of the hospital) by Dr. J. GALLEY BLACKLEY and Dr. D. DYCE BROWN.

Clinical lectures on Surgery, by Dr. JAMES JONES.

Clinical lectures on Diseases of the Ear, by Dr. COOPER.

The hospital contains 65 beds.

Contributions are requested in aid of the funds of the hospital, and for the general purposes of the School.

For further information as to fees, free admission, &c., apply to Dr. Bayes, Hon. Sec., or to

FRED. MAYCOCK, Secretary.

ROYAL COLLEGE of SCIENCE for IRELAND, STEPHEN'S GREEN, DUBLIN.

SCIENTIFIC AND TECHNICAL EDUCATION.

This College supplies a complete course of Instruction in Science, applicable to the Industrial Arts, especially those which may be classed broadly under the heads of CHEMICAL MANUFACTURES, MINING, and ENGINEERING.

A Diploma of Associate of the College is granted at the end of the Three Years' Course.

There are Four Royal Scholarships of the value of £50 each yearly, with free education, including Laboratory Instruction, tenable for two years. Two become vacant each year. They are given to students who have been a year in the College.

The Fees are £2 for each Course, or £10 for all the Courses of each year, with the exception of Laboratory Practice.

Chemistry (Theoretical and Practical), Metallurgy, &c.—Professor GALLOWAY, F.C.S.

Mathematics, Mechanics, and Mechanism—Professor HENNESSY, F.R.S.

Descriptive Geometry, Drawing, Engineering, and Surveying.—Professor PIGOTT, C.E., M.R.I.A.

Experimental Physics (Theoretical and Practical).—Professor BARRETT, F.R.S.E., F.C.S.

Mining and Mineralogy.—Professor O'REILLY, C.E., M.R.I.A.

Botany.—Professor MCNAB, M.D., F.L.S.

Zoology.—Professor LEITH ADAMS, M.B., F.R.S.

Geology.—Professor HULL, M.A., F.R.S.

Palæontology.—Mr. BAILY, F.G.S.

The Chemical and Physical Laboratories and Drawing School are now open daily for Practical Instruction.

The SESSION COMMENCES on MONDAY, OCTOBER 1st.

Programmes may be obtained on application to the Secretary, Royal College of Science, Stephen's Green, Dublin.

FREDERICK J. SIDNEY, LL.D., Secretary.

MEDICAL ALLIANCE ASSOCIATION (late East London Medical Defence Association).

This Association, in its efforts to suppress the practice of Medicine by unqualified persons, has instituted numerous prosecutions in various parts of London, and at the present time is engaged in further prosecutions. It has been decided to extend its operations to beyond the Metropolitan district. The subscription is 10s. 6d. a year, and the year commences from the date that Gentlemen join the Association, and they are now invited to do so.

Further information will be given by

R. H. S. CARPENTER, Honorary Secretary,
533 Commercial Road, E.; or
J. T. HAZELDINE, Esq., Solicitor to the Association,
58 Cheapside, London, E.C.

IRISH POOR-LAW INTELLIGENCE.

ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD FOR IRELAND.

ABSTRACT

THE Board submits a summary of weekly returns of persons relieved in the workhouse and out of the workhouse for fifty-two weeks, to the week ended 10th February, 1877. It appears that supervening on the decrease noticed in the last year's Report, there has been a further decrease in the number of workhouse inmates, accompanied by a small increase in the number receiving out-door relief.

ORPHANS AND DESERTED CHILDREN.

The number of orphans and deserted children put out to nurse from the workhouses in Ireland has fluctuated very little during the two years 1874-5 and 1875-6, having been usually about 1,450 daily; but since the recent Act, 39 & 40 Vic., c. 38, extending the legal age from 10 years to 13 years, the number has sensibly increased, as was to be expected, and on the 10th February last was 1,566.

An Order was issued under seal, as required by the Act, to provide due security for the maintenance, the education, and supervision of children boarded out by the Guardians.

OUT-DOOR RELIEF.

The next table exhibits the fluctuation for twenty-one years past of the number on out-door relief.

On the last Saturday of February the total number of persons receiving relief out of the workhouse under the 1st section has increased from 31,496 to 32,420, a difference of 933; there is an increase of 411 in the class of "permanently disabled;" of 265 in the class of "widows with two or more legitimate children;" and of 257 in the class of "persons disabled by severe sickness or serious accident."

CASUALS.

The great reduction in the number of casuals or night lodgers noticed in our last annual Report has been maintained, subject to some slight fluctuation at about the same average as in last year.

DEATHS.

The total number of deaths in the workhouses in the fifty-two weeks comprised in the table has been 10,129. In the corresponding table in the last Annual Report the total number of deaths was 11,333; so that there has been a decrease of 1,204 deaths, as compared with the number last year.

Deaths by fever were 612, as against 703; by lung disease, 1,633, as against 2,045; and deaths by small-pox only 2, against 41 in last year.

TOTAL NUMBER ADMITTED.

A decrease of 2,436 has taken place in the total number admitted in sickness during the year; a decrease of 26,112 in the number admitted who were not sick; a decrease of 1,439 in the number suffering from fever and other dangerous contagious diseases, and a decrease of 31,045 in the total number relieved;—the numbers relieved during the year were less than the numbers relieved in any year since 1860.

UNION EXPENDITURE.

We now proceed to the statistics arising out of the accounts of the unions for the year ended 29th September, 1876.

We deal in the first place with that part of the Union expenditure which relates exclusively to the relief of the poor.

There has been a decrease of £17,075 in the cost of "in-maintenance and clothing," but an increase of £2,628 in "out door relief," of £450 in cost of "deaf, dumb and blind," £3,048 in "salaries and rations of officers," and of £2,551 in "all other expenses," resulting in a net decrease of £8,398, while the decrease in the total number relieved has been 31,261.

PARLIAMENTARY GRANT.

The following is a statement of the Parliamentary Grant for Medical and Educational purposes, and for Salaries under the "Public Health (Ireland) Act, 1874," for the year ended 25th March, 1876:—

	£	s.	d.
Medical purposes, . . .	69,586	5	10
Educational purposes, . .	8915	8	4
Total for medical and educational purposes, . . .	78,501	14	2
For salaries under Public Health Act, . . .	12,167	0	11
Total, . . .	90,668	15	1

The total amount claimed and allowed under the Parliamentary Grant for Medical and Educational purposes for the year ended 25th March, 1876, namely, £78,501 is £206 less than the amount for the previous year.

SALARIES UNDER PUBLIC HEALTH.

The amount for Salaries under Public Health (Ireland) Act appears for the first time.

The total expenditure of poor-rates for all purposes, viz., relief, medical relief, burial grounds, registration of births, deaths, and marriages, sanitary measures, and expenses under Superannuation Acts was in 1875 £975,044, making a poundage of 1s. 5¼d. on the valuation. In 1876 the expenditure for all purposes was £1,045,505, being 1s. 6½d., an increase of £70,461, which increase is composed of £59,482 payments under National School Teachers Act, a newly created source of expenditure, and of an increase of £11,070 under Cattle Plague Act, less by a net decrease of £91, on other accounts.

In the Session of Parliament of 1876 an important alteration was made in the law by which the electoral divisions of unions in Ireland are separately charged with the cost of maintenance of their respective paupers.

By this alteration the charge for in-door relief was

limited to a certain amount of poundage on the electoral division, the residue being charged to the union at large, while the out-door relief continued to be charged on the electoral division in full as before.

The object of this change was to lessen the pressure on over-charged electoral divisions, chiefly town divisions, and in some instances that object has been attained in a considerable degree. For example, the New Ross Electoral Division, on which the entire expenditure charge for the year ended 29th September, 1876, was 4s. 1¼d. in the pound, was in the account for the second half year relieved by the operation of the new law to the extent of 8¼d. in the pound (which on the whole year would be 1s. 4½d.), that amount being charged on the union at large, including the New Ross Electoral Division.

DECREASE OF MEDICAL RELIEF.

In Ulster there has been a decrease of 5,941 cases at the Dispensaries, and of 7,097 of those attended at their own houses.

In Munster there has been a decrease of 5,160 cases at the Dispensaries, and of 227 of those attended at their own houses.

In Leinster there has been a decrease of 1,828 cases at the Dispensaries, and of 768 of those attended at their own houses.

And in Connaught there has been a decrease of 1,270 cases at the Dispensaries, and of 1,151 of those attended at their own houses.

This shows a decrease of 23,442 cases for all Ireland, including both classes, as compared with previous year; being 14,199 Dispensary cases, and 9,243 cases of persons attended at their own houses.

VACCINATION.

The following table contains a summary of the total number of cases of vaccination during the year ending 30th September, 1876, in each of the four provinces, the cases being classified under the heading, "under one year old when vaccinated," "above one year old," and "other persons,"

Provinces.	Children Born since 1st January, 1864.		Other Persons.	Total.
	Under one year old when Vaccinated.	Above one year old when Vaccinated.		
Ulster, . .	33,674	3,656	590	37,920
Munster, . .	25,555	6,327	850	32,732
Leinster, . .	20,897	3,827	215	24,939
Connaught, .	12,935	5,618	343	18,896
Total Ireland,	93,061	19,428	1,998	114,487

The following are the totals under each of the above headings for the previous year ended 30th September, 1875:—

94,370 25,305 17,665 137,340

It will be observed that there is a decrease in the total number of cases vaccinated and re-vaccinated in all Ireland of 22,853 cases.

This decrease at first sight appears remarkable, but admits of explanation to a certain extent.

During the presence of small-pox in districts more or less panic exists amongst the inhabitants, who usually in large numbers avail themselves of the protective influence which the operation of vaccination affords, and thus vaccination and re-vaccination are had recourse to, but when as a consequence of its cessation the alarm caused by the immediate presence of the disease abates, re-vaccination is not had recourse to, and parents are not so prompt in bringing their children even for primary vaccination, and the result in general, if not invariably, is, that the year following an epidemic of small-pox there is a considerable reduction in the number of persons vaccinated.

The statistics of vaccination during the year ended September 1875, when compared with September 1876 (to which this report refers), show this very forcibly.

SMALL-POX.

During 1876 the number of cases of small-pox recorded by the Medical Officers of all the Dispensary Districts is only 29, consequently there was no cause for unusual alarm, and vaccination was not so actively conducted, and re-vaccination was little resorted to.

During the year 1875, 881 cases of small-pox were reported, of which 140 occurred in Ulster, and 674 in Connaught, and it is in those two provinces that, as might be expected, there was such an augmentation in the number vaccinated during the prevalence of small-pox, and a corresponding falling off the next year, 1876, the disease having subsided.

During the prevalence of the disease in a severe form in Ulster and Connaught 21,426 persons, all upwards of one year old, were vaccinated; this number was composed of children not previously vaccinated and of cases of re-vaccination; and in 1,998 instances adults offered themselves anxious to undergo the operation, they being under no legal obligation to do so, and they also brought their children to be vaccinated, thus showing their confidence in the protective influence which they believed the operation would afford.

Still, having regard to the number of children annually born in Ireland, the number vaccinated when under one year of age cannot be regarded as quite satisfactory.

Last July small-pox prevailed in London, Liverpool, and Manchester, and the Local Government Board, apprehensive lest the disease might be introduced into Ireland by means of Irish paupers returned under removal warrant to their native country, addressed a letter to the Under Secretary for Ireland.

Communications were thereafter made to the Home Office, and lengthened correspondence ensued.

No case of small-pox has as yet occurred amongst Irish paupers removed from England under warrant, but the disease has since the date of the above communication been introduced into Ireland from England.

A woman, named Elizabeth Coles, left Manchester, with her husband and child, in July, 1876, and arrived in Dublin on the following day. She was visited by one of the Medical Officers of the South Dublin Dispensary District, and was found to be suffering from small-pox, and was then removed to Sir Patrick Dun's Hospital.

Since this date several other cases of small-pox have been introduced into various localities in this country from England, but owing to the prompt precautionary measures which were adopted, and to the efficient manner in which vaccination had hitherto been conducted in Ireland, the disease spread to a very limited extent.

However, the introduction of small-pox into this country from England shows how well-grounded was the apprehension on the part of the Local Government Board as to the possible extension of the disease to Ireland by the removal of paupers under warrant from localities in England in which the disease prevails.

Although the preceding statistics only refer to the year ended the 30th September, 1876, it may be of interest to observe that during the quarter ended the 31st December, 1876, only 9 cases of small-pox were attended by the Medical Officers of the Dispensary Districts.

IRISH NATIONAL COW-POCK INSTITUTION.

Representation having been made in Parliament that the annual grant of £400 to the Irish National Cow-pock Institution was insufficient, the Government consented to increase the grant to £1,200, provided that the supply of vaccine lymph, which hitherto had been paid for by the Poor-law Unions, be in future gratuitous, and that the institution be placed under the management of the Local Government Board.

The Governors of the Cow-pock Institution willingly assented to the proposal of the Government, and from the 1st of April, 1877, the collection and distribution of lymph will be directed and controlled by the Vaccine Department of the Local Government Board.

Under this arrangement a circular has already been issued in relation to the future supply of lymph to each Board of Guardians and to each Dispensary Committee, a copy of which will be found in the Appendix.

COLLECTION OF LYMPH.

On reference to this circular it will be found that a very material change has been made in the mode of collecting lymph, which heretofore has been collected by the Dublin Cow-pock Institution almost entirely on ivory points. It will hereafter be collected exclusively in capillary tubes, and submitted to microscopic examination and approval, as is done in England, before distribution, and proper registers will be kept by the collectors so as to enable the source of the supply to be ascertained in every case in which inquiry may be found to be necessary on the occasion of complaint or otherwise.

ENNIS UNION.

A RESIDENT MEDICAL OFFICER.

MR. HALPIN proceeded next to bring forward for discussion his notice of motion respecting the appointment of a resident medical officer in the house. He said that from the complaints against the doctors, and the fact that one man is competent to discharge the duties of both officers, he would move that a resident medical officer be appointed, who would always be available in cases of urgency.

Mr. P. J. Coffee—Is that a written resolution?

Mr. Halpin—No, but I'll write it.

The Chairman—Does anyone second it? It would be against my principles to vote for it, and besides I think it it is direct antagonism with the late decrease in salaries. If it went before the Local Government Board it would look very bad indeed.

Mr. Coffee—It is unfair for any man to traduce the character of others.

The Chairman—I don't think Mr. Halpin has done so. He has said before the doctors' faces more than what he said to-day.

Mr. Halpin—I did, and I was not afraid to do so. The doctors are afraid to come here themselves, and they put forward a man to defend them.

The resolution was withdrawn.

A SANITARY BOARD "SCENE."

AT a meeting of the Limerick Sanitary Board, a rather lively scene took place, consequent on an application from Dr. Robert Barry, consulting medical officer, to have his present salary of £15 per annum, increased.

Mr. Cronin moved—That the corporation be recommended to increase Dr. Barry's salary to £30 a year, and the proposition was about being put from the chair, when

Alderman Myles objected on a point of order. He wished to know whether, the council having in the first instance fixed the salary, the application for an increase should be made to them, and not to the Sanitary Board.

Mr. Cronin—I am more than astonished to hear Alderman Myles raise such a point as this, sir. I know matters of this sort to have been settled after the manner just proposed hundreds of times.

Alderman Myles—Well, sir, I can bear out Mr. Cronin in that. I know things to have been done wrong hundreds of times in the corporation. Things have been done illegally hundreds of times at No. 2 Committee, and Mr. Cronin himself has been one of the greatest delinquents.

Mr. Cronin (warmly)—I could never take half the credit for being so monstrous a jobber as Alderman Myles himself.

Alderman Myles (rising)—This is an expression that ought not to be used, and if it is allowed to go unchallenged I will contradict it in the plainest manner possible by calling it a lie.

Mr. Cronin—I say it is not a lie, and if you contradict I will repeat that you have no right to perpetrate a job.

The Chairman—I think gentlemen, for your own respect and for that of the meeting, you ought to withdraw the words you have used.

Mr. Cronin—Let Alderman Myles withdraw his first.

The Chairman—No matter what Alderman Myles does you ought to withdraw.

Some cross-firing ensued, but finally, several members having appealed, Mr. Cronin consented to withdraw the words he had used.

The resolution in a modified form was unanimously adopted, after a prolonged discussion.

DUNGARVAN UNION.

THE MEDICAL OFFICER'S OPINION.

A NOTE was read from the secretary of a Dublin hospital requesting payment of £16 18s. for treatment and maintenance of a patient named Cronin.

The Chairman asked was it not against the consent of the medical officer that Cronin was sent to the institution. There were several parties sent to Dublin from the union against the opinion of the medical officer, and they had to be sent home without deriving the slightest benefit, having, however, caused great expense to the ratepayers.

Several guardians concurred. The account was ordered to be paid.

Dr. Hartland applied for two weeks' leave of absence. He had procured the services of a substitute to act during his absence. The majority of the board were for having Dr. Hartland pay his substitute, and not the ratepayers. —Granted.

ATHY UNION.

LUNACY CERTIFICATE FEES.

"Local Government Board, Dublin,
11th August, 1877.

"SIR,—The Local Government Board for Ireland forward to be laid before the guardians of the Athy Union the accompanying copy of a letter which they have received from Dr. Hobson, medical officer of the Ballylinan dispensary district, relating to his application for payment of a fee of one guinea for his services in examining a person alleged to be a lunatic, together with a copy of the Board's reply.—By order of the Board.

"B. BANKS, Secretary.

"The Clerk, Athy Union."

The following is the correspondence referred to :—

"Ballylinan, Athy,
August 4, 1877.

"Sir,—The guardians of the Athy Union have refused to pay an order for £1 1s., signed by two magistrates for my professional attendance and examination of an alleged lunatic, named Lewis Moore, of Shanganamore, on the 30th of June, 1877. After a lengthened examination I gave my opinion to the magistrates that Lewis Moore was not a lunatic. Under these circumstances I wish to be informed if I am entitled to be paid by the guardians, whose answer to my application I beg to enclose.—I am, &c., "ABRAHAM HOBSON.

"To B. Banks, Esq., Secretary to the Local Government Board, Dublin."

"Local Government Board, Dublin,
11th August, 1877.

"Sir,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 4th inst., and of

its enclosure, relating to the refusal of the board of guardians of the Athy Union to pay you a fee of one guinea, as ordered by the justices under the provisions of the 28th and 29th Vic. c. 67, for your services in the examination of a person alleged to be a lunatic, and in reply to your inquiry the Local Government Board desire to state that they are of opinion the guardians are bound to comply with the order of the justices. The circumstance that the father of the alleged lunatic is in a position to pay the fee does not affect the question in the opinion of the Board.—By order of the Board.

"B. Banks, Secretary.

"A. Hobson, M.D., Ballylinan."

The following is the order of the guardians with respect to the doctor's application :—"Application refused, as the guardians consider the father of the alleged lunatic should pay the fee.

"F. M. Carroll, Chairman."

The Chairman considered the guardians had no alternative but to pay the money.

An order was made in accordance with the Chairman's opinion.

SUPERVISION OF SALE OF MILK.

The Society of Public Hygiene of Berlin has appointed a special commission to overlook the milk, in such establishments as may accept their control. The state of health of children nourished by the milk of these establishments is to be inquired into, while a veterinary surgeon oversees the purchase, health, stabling, and condition generally of the animals. The proprietors are to inform the Commission when any animal is taken sick, and not to use the milk of any animal pronounced unfit by the veterinary surgeon. The Commission have the right of examining the milk at any time.

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING AUG. 11, 1877.

Total registered deaths in Dublin and suburbs*	...	138
Ten years average of same week	...	127
Excess of mortality above average	...	11
10 weeks mortality, suburb of Rathmines	17·5 per	1,000
„ „ „ „ Donnybrook†	14·7 „	
„ „ „ „ Blackrock	18·0 „	
„ „ „ „ Kingstown	17·7 „	
„ „ Entire Dublin District	22·8 „	
Comparative Ratios—London ...	19·1 „	
„ „ Glasgow ...	21·0 „	
„ „ Edinburgh ...	19·3 „	

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

The number of deaths from zymotic diseases registered during the week is 22; average number for the corresponding week of the previous ten years 32·2. The deaths from these diseases include 6 from measles—being 5under the number in the preceding week, and 8 less than in the week ended 28th July—6 from fever (all of the typhoid character), 4 from diarrhœa, 2 from influenza, 1 each from diphtheria, croup, whooping-cough, &c.

The deaths of 7 children were ascribed to convulsions.

Bronchitis was the cause of 14 deaths, pneumonia and pleurisy of 2 each, laryngitis of 1, and lung disease unspecified of 3.

Heart disease caused 9 deaths, aneurism 1, apoplexy 1, brain disease unspecified 4, and kidney disease 1.

Twenty-three persons died from phthisis, 2 from mesenteric disease, and 1 each from scrofula, and hydrocephalus or water on the brain.

Seven accidental deaths were registered, viz., 4 from fractures and contusions, 2 from drowning, and 1 from "accidental injuries."

Two deaths from measles, 2 from fever, 3 from diarrhœa, and 1 from whooping-cough were registered in Belfast during the week.

Table *showing for* Eight Large Towns, &c., *the* Area, *in Statute Acres; the* Population *in* 1871; *the* Annual Rate of Mortality *per* 1,000 *Inhabitants represented by the Number of Deaths registered during the Week ending Saturday, August* 11*th*, 1877; *the Total Number of* Births and Deaths *registered during the Week with the Number of* Deaths *at certain Ages, and from* Several Causes, &c.

ON SYPHILIS AS IT AFFECTS THE BRAIN AND NERVOUS SYSTEM.

By Thomas Stretch Dowse, M.D., F.R.C.P. Edin.

Late Physician-Superintendent to the Central London Sick Asylum, Highgate; Physician to the North London Hospital for Consumption and Diseases of the Chest.

Chapter I.—History.

There can be no doubt, although syphilis (*a*) was not recognised as an especial and characteristic disease until the end of the 15th century, it existed at a much earlier period. (*b*)

We first find French writers (*c*) directing attention to this malady about the year 1490, and from this time until the present it has presented a constant theme for discussion and argument amongst the most learned members of the medical profession.

The first treatise written in the English language upon "Lues Venerea" was by Wm. Clowes, one of her Majesty's chirurgeons (1596), who mentions that he had known divers persons infected who were free from any disease of the organs of generation, and there can scarcely be found a writer of note in European medical literature who has not advanced some theory concerning its nature.

At the end of the last century we find amongst others who have specially signalised themselves for investigating this disease the names of Bartholin, Zacchias, Th. Bonet, Tissot, Morgagni, Astruc, Lazerme, Sauvages, Lieutaud, Cyrillo, Piso, Cardona, Raïken, Pelargus, &c., &c.; whilst the most eminent writers of the modern period are Ricord, Diday, Lagneau, Lancereaux, Fournier, Bazin, Virchow, Wegner, Dittrick, Von Barensprung, Zeisl, Bergh, Boeck, Bidenkap, and Bumstead; and in our own country Murchison, Moxon, Weber, Payne, Lane, Lee, De Meric, Hill, Gascoyen, Jonathan Hutchinson, and Wilks.

With especial reference to the action of syphilis upon the nervous system and nervous centres, nothing much appears to have been known even by such distinguished authorities as John Hunter and Sir Astley Cooper.

Yet it is evident from the works of Fernel and Fracastor, who speak of the cure of venereal algæ (*a*) that the effect of this poison upon the nerves could not have been altogether unknown to them, and Paracelsus (*b*) states that the Lues Gallica is at times complicated by paralysis and disease of the heart.

Nicholas Massa also speaks of several specific neuralgias. (*c*) Baillou writes of specific neuralgias, and mentions the case of a patient who, after suffering from a complicated cephalalgia with loss of several senses, died through a venereal tumour compressing the optic and olfactory nerves. (*d*)

Riviere mentions (*e*) a cephalée of the same nature.

(*a*) As to the etymology of the word "Syphilis" we are indebted to Fracastor, who was the first to make use of it; and has its origin in the following mythical story, "Syphilis," who was King Alcithoo's shepherd, having insulted Heaven by vaunting the riches of his master, the Creator corrupted by "humours" those who raised altars to the monarch, and covered them with "pustules and ulcers," the pain of which deprived them of all sleep. The people ever after called this plague by the name of the impious wretch who provoked it.

(*b*) M. Littré mentions having found allusion to syphilis in a writer of the 13th century, and a correspondent in the *Brit. Med. Journal* of January 23, 1875, suggests that reference is made to this disease in the 38th Psalm of David.

(*c*) It is said of Rabelais, that as he was kneeling once at church before the statue of King Charles, a monk came and said to him that doubtless he mistook the King's statue for that of some saint; but Rabelais immediately replied "I am not so much a blockhead monk (swearing) as thou thinkest me, nor yet so blind as not to know that I kneel before the representation of King Charles, for whose soul I am praying, because he brought the pox out of Naples into this kingdom, by which means I and other physicians have been the gainers."

(*a*) "Cura doloris an a lue venerea," "Universa Medica," lib. vii, consilium lxxii.

(*b*) "Livre de Chirurgie, De morbo Gallico."

(*c*) *Ibid.*

(*d*) "Liber Paradigmatum," No. 7.

(*e*) "Centurie" II, observ. xci.

Baglivi (*a*) mentions the case of a Venetian who was struck with paralysis in one of his limbs in consequence of a venereal infection.

In 1813 Pariset (*b*) stated that sometimes there is found arising from syphilis accidents of a varied character, such as epilepsy. Bard (*c*) also affirms that the syphilitic virus has the power to irritate the nerves and to disturb their tranquillity, without any alteration being perceived in the parts, also to cause pains in the head, articular pains, tremblings, and epilepsy.

The true recognition of pathological changes in the nervous system appear to take their standpoints in the works of Dr. Zambaco (*d*) and M. Lanceraux. (*e*)

From this time, year by year, day by day, additions have been made by pathologists of all countries with lengthy strides towards a solution of what is the exact nature of these syphilitic changes. Their nature does not seem to be so doubtful as their exact seat of origin and mode of progression.

I believe it is due to Dr. Reid, of Belfast, to state that he was the first of our countrymen to draw attention to syphilitic disease of the nervous system. He was, however, soon followed by Broadbent, Hughlings Jackson, Buzzard, and many other observers.

Nature and Pathology.

Thus far we have a slight sketch of the history of syphilis, and now proceed to notice very briefly some essential points in reference to its nature and pathology as evidenced by the more recent investigations.

Admitting that in this disease we have a series of variable phenomena which for some time induced many observers to conclude that we have two or even three kinds of syphilitic poison, which idea gave rise to the pluralistic doctrine of Carmichael, and however much we may be led away by the varying features assumed by syphilis, I am certainly inclined to believe that the weight of material clinical fact rests with the assertion of Mr. Hutchinson (*f*) and Sir James Paget that we have in syphilis but one malady and one virus. The various ways in which the poison affects the constitution has never, to my mind, proved the dualistic theory, but rather shown that certain conditions of the blood, or constitutional state, the diathesis, or even the mental state, can and does essentially influence its action, its course and elimination, as well as of necessity the organic changes which it produces in the vital economy.

Hunter prefaces his work on venereal diseases by the statement that in the action of the syphilitic virus there are four morbid processes at work, which he calls :—

1. The adhesive inflammation.
2. The suppurative inflammation.
3. Ulceration.
4. Mortification.

This remark is worthy of the great master who wrote it, but time brings with it modifications.

Histology shows us that there is no very essential difference in structure between an indurated chancre, a secondary tubercle, and a tertiary gumma, and it is well to note here that in the low forms of inflammations engendered by this virus, they are all more or less distinguishable as fibro-plastic, consisting of small nuclei, fatty granules and amorphous material. Yet it cannot be affirmed that all gumma are of precisely the same nature, any more than it can be stated that the products of the more common inflammations are essentially of the same kind. Sir James Paget, (*g*) in speaking of the relation which syphilis bears to other diseases, says :—"I think that one of the things which we have most to study both in the pathology and treatment of syphilis is the modifications which it undergoes in persons of different constitutions in whom it may be inserted." "I think we should look for facts which would indicate that out of the constitution of each person into whom the syphilitic virus is inserted, there may come a different—not essentially different, but a modified result."

In my own practice for the past seven years at the Central London Sick Asylum, where I have had over 10,000 patients under my care, of whom I have no hesitation in saying that three-fourths were more or less the subjects of acquired and hereditary syphilis, I have often been puzzled how to arrive at a definite conclusion as to the exact type of disease with which I have had to deal.

In the scrofulous, the gouty, the rheumatic, and even the cancerous diathesis, syphilis has been so masked, that the functional troubles, as manifested by objective signs and symptoms, have produced a condition so hybrid in character that the most patient and careful investigations have failed for some time to lead me to a correct diagnosis, and I presume that my experience in this respect has not been altogether different from that of other observers. It is in the sequelæ or tertiary stage that these complications are more apt to arise, and especially in middle and advanced life, and in no class of cases is the diagnosis more puzzling than in the many and varied forms of what are called functional neuroses or nervous diseases. If we are guided by our patients' own statements as to their history, if we expect to find an account of the incubation period, the primary and secondary stages, the earthy complexion, nodular or atrophied testes, &c., we shall in many cases fall short of the truth and be led into error. Yet in all such, if due care be taken and the field of clinical research is thoroughly explored, some, although slight, sign reveals itself, which throws a flood of light to illumine what was before a darkened camera. This might be a patch upon the choroid, an optic irregular neuritis, a faint interstitial keratitis, an unequal thickening of the vocal cords, with cicatrices of old ulceration, and last, but not least—and especially where syphilis is associated in a gouty habit of body—psoriasis upon the sides of the tongue, as well as an indurated irregular thickening of the lower bowel. So much do I believe in this latter condition existing that I feel sure, if it was looked for, it would be found to occur with no less frequency than a psoriasis upon the palms of the hands or soles of the feet. How frequently do we not find, on the other hand, well-marked signs of syphilis in its acquired form where all evidence of primary infection is absent?

I do not think that this can be as well maintained of the secondary stage, and in such instances it is well to remember that inoculation must arise from contact, and that the sore, to produce its trail of sequence, need not (as was at one time supposed) be of necessity a hard Hunterian chancre. I have seen the most severe secondary symptoms to follow an abrasion which healed in a few days by the use of lead lotion, where no induration could be detected ; and yet in this very case, when the patient became weakened physically by continuous mental anxiety, five years later, a hard indurated nodule appeared on the spot of the primary abraded surface at the same time that gummata showed themselves on other parts of the body, and it was proved beyond question that he was not in any other way infected.

If this case stood alone, it could not be accepted as proof that the blood and tissues might become syphilised by any other process than that promulgated by a hard indurated sore ; but it is now the accepted doctrine that a syphilitic exanthem can result from any kind of sore with which the virus has come into contact.

This fact was completely substantiated in the evidence taken by the Medical Commission appointed by the Admiralty so far back as 1865, presided over by Mr. Skey, to investigate the whole question of venereal disease, with

a view to its prevention. The committee, in their report, stated that twenty-nine experienced witnesses gave evidence that sores, both soft and hard, may be followed by every variety of syphilitic eruption.

Dr. Wilks, who has studied the subject of visceral syphilis, has made the statement—which is borne out by my own experience—"that in those cases where the primary and secondary manifestations of syphilis are least marked, the viscera and nervous system are affected in an inverse ratio." From many *post-mortem* examinations which I have made of syphilitic disease of the nervous system, where the meninges (as well as the substance of the brain and spinal cord) have been involved, I am bound to admit that I have not found similar changes in the liver, spleen, heart, and lungs, as a rule; and, on the other hand, where gummata and syphilitic products have been found freely distributed through these viscera, the nervous system has usually been found free. I might note also that a similar condition, of equal comparative value, exists between the nervous system and the more objective syphilitic factors and signs, which have been described; so that diagnosis of syphilitic lesions of the spinal cord, as apart from their other degenerative connective tissue-changes, is a matter of no small difficulty, and of very questionable certainty. Let it be remembered that I am here referring to the nervous system *per se*, and not to pressure upon it by changes in the osseous system.

This appears to be a point of so much clinical importance that it ought not to be passed over lightly. Often have I had patients totally ignorant of having at any time acquired or experienced the signs or symptoms of syphilis in its primary and secondary stages, yet the sequelæ have been made manifest in many ways, particularly in many of the obscure diseases of the nervous system, where there are none of the common forms of objective paralysis, of gross lesion of brain and spinal cord; yet there is good evidence in proof of functional derangements, the result of albuminoid changes in the vaso-motor and sympathetic centres.

In reference to the syphilitic virus, in producing constitutional changes we have, as it has been seen, considerable difficulty, not only in making ourselves acquainted with the precise stage of the disease, or periodicity of the stage in question, or the time that the poison has been lying dormant in the blood, previous to the secondary rash having made its appearance; and here we find it, in practice, not an easy matter to map out, with Mr. Hutchinson's geometrical precision, the stages of the definition of specific fever. But this by no means detracts from the fact, or invalidates the comparative relationship. For we have many causes to alter the typical course of syphilitic agency in precisely the same way that we find other specific fevers to vary in their manifestations, course, and sequelæ; and however much I am willing to admit the doctrine of the death of the duality or plurality of the syphilitic virus, I think it is impossible to discard altogether the idea of its being so modified—I do not mean merely diluted—that its action might be unable to produce the stage of exanthem, yet its sequelæ become the more striking, although perhaps not of such definite character. That the stages of the syphilitic fever can be completely upset (leaving diathesis or temperament out of the question altogether) by the mode of life in the person infected is, to my mind and in my own experience, quite a recognised fact.

In the lower class of prostitutes, who live to drink and rarely eat, who are exposed to vicissitudes of atmospheric influence, the change from the secondary to the tertiary periods is so rapid and so wanting in definition that I have seen many cases where gummata and rupial masses have co-existed with the roseola maculata of two weeks' duration. I have also had cases, which will be detailed, showing that, in addition to the gummata and roseola co-existent, there has been pulmonary hæmorrhage and albuminofibroid changes going on in the viscera, the urine loaded with albumen, retinal extravasations, localised cerebral thrombosis and eclampsia. These patients have got rapidly well by treatment, but not necessarily by iodide of potassium or mercury. Again, in some cases which I have published on basic cerebro-spinal meningitis, I found this form of disease associated with syphilitic roseola; and, in fact, in most all my cases of this basic form of inflammation occurring in young people, there has been a marked history of syphilis (see cases recorded), and in its secondary stage. This is interesting, and has not been noted by other observers—in fact, I believe it is usually admitted that the nervous system is rarely, if ever, influenced by the syphilitic poison whilst in the secondary stage. We shall, I hope, clearly disprove this idea. So far, I repeat, it is difficult sometimes to define the stages of syphilis with accuracy, and for this reason the one-virus theory might still be open to some doubt.

The same might be said, again, of visceral syphilis becoming manifest during the secondary stage—I mean the active period. The liver and spleen may become enlarged, but I do not think these glands are so much influenced as the lungs. If at this time we have pulmonary hæmorrhages and pneumonia—not so uncommon—I think we are justified in assuming that the "origo mali" is syphilis, the more especially as mercury rapidly cures it. Here we find the pathological condition of the lung very different to that where we have chronic syphilitic changes. In the former, the air-cells are centrally and primarily involved, as well as the endothecium of the small vessels; whilst in the latter we find perivascular and peri-bronchial cell and fibre proliferation; and I would here remark that in my experience the poison of syphilis does not influence the tubercular diathesis or the tendency to gout or scrofula, but rather keeps their respective actions dormant, or in a state of subjection, whilst it is running an active course. I have very many cases to prove this (see recorded cases), so that if in the second stage of syphilis we had an active pneumonia, I should unhesitatingly characterise this as syphilitic, much more than I should a fibroid lung in advanced syphilis with caries of the bones, nodes, &c.

The syphilitic picture at present exists in bare outline, and it requires the master hand of some skilled workman to complete its detail and give it true colouring. We see in the background a dark chaotic mass shaded here and there by vague tints of an uncertain hue, which are being gradually developed, however, with a rapidity which bids fair soon to present us with a consummate masterpiece of medical art. In the more important phases of this disease we find an infinite variety of opinion. 1. There are some who deny that it bears any resemblance to a specific fever. 2. That its stages, if any exist, are so indefinite and variable that the comparison is of little practical value. 3. That in the tertiary form it continues to be a blood disease. 4. That there is not in symmetry any especial distinguishing characteristic between the exanthem and gummatous periods.

Others, again, make these divisions their standpoints, and no one has yet brought forward any evidence to upset the careful and philosophical reasonings of Mr. Jonathan Hutchinson.

There is something subtle and uncertain about syphilis which puzzles the histologist, pathologist, and clinicist alike, and it is probably this which gives to it so much scientific interest. Yet there is a profundity of research open in the study of this disease which rises even above scientific investigation; I allude to its heredity, diagnosis, and treatment. It takes a range far wider than any other in the whole field of pathology. Once let a man become infected with syphilis, we then have reason to anticipate that not only he, but his children, will in some measure become the subject of syphilis.

MATICO IN POST-PARTEM HÆMORRHAGE.

By E. Marlett Boddy, F.R.C.S., &c.

The use of matico in post-partem hæmorrhage is doubtless of uncertain efficacy, and its operation therein akin to empirical, but nevertheless in one case of obstinate flooding I found it of some utility. I had no idea at the time that this astringent would have been beneficial, and I only used it, I may say, at a venture, as I had no ergot by me at the time.

The preparation I used being the *tincture*, is not recognised by the "British Pharmacopœia," nor is there any mention of it either in Garrod's "Materia Medica," or Ringer's "Handbook of Therapeutics," consequently it is not considered a therapeutic agent. I mention this fact in case some may be tempted to refer to those books, and not finding any notice of this preparation, conclude I am in error.

It was the usual parallel case of post-partem hæmorrhage which one now and then meets with in general practice, so to give a concise account of it would be puerile; let it suffice when I tell my readers that I gave this tincture of matico instead of ergot, and the hæmorrhage decreased from the time I administered it. I will not attempt to discuss the *modus operandi*, for it is not very plain.

Naturally, this being an isolated case, one cannot affirm with any degree of certainty that there is any real efficacy of matico in post-partem hæmorrhage, or that its action therein is on a par with ergot, because one single case is not sufficient for one to arrive at such a conclusion, besides it would be an absurdity; however, it is deserving of some consideration.

It seems possible, nevertheless, that if matico is useful in staying bleeding on free surfaces, it might be used with advantage in uterine hæmorrhage; most decidedly it would not cause those painful contractions of the uterus as ergot usually does.

One very useful hint may be learnt from this case, however, and that is, an injection of a liquid preparation of matico, such as the infusion, would be quite as advantageous and not so dangerous as the perchloride of iron injection, which has been known to cause a fatal termination.

Therefore, as nothing of a pernicious nature could possibly ensue from an injection of the infusion of matico, it is much preferable to an injection of the perchloride of iron.

NOTES UPON CHLORAL IN INFANTILE CONVULSIONS.

By John W. Martin, M.D.,
Dronfield, near Sheffield.

During the past year I have been called upon to treat about forty cases of infantile convulsions, many of them presenting symptoms of a most alarming nature; and in four or five instances the appearances being almost hopeless, I at first tried free purgation, bathing the feet in mustard and hot water, and the administration of five-grain doses of bromide of potassium to children over nine months of age. Not being satisfied with the rapidity of results obtained, I began to combine chloral hydrate in two-grain doses with the bromide mixture, and found the combination to act with the happiest results. I am glad to find myself confirmed in the beneficial results to be obtained by this treatment, by the following extract from the *Canada Medical Record*:—

"Löwenstamm (*Medicinish-Chirurgisches Centralblatt*), speaks of numerous instances in which he has tested the efficacy of this drug in convulsions; and he gives one case in detail. The patient was the third child of a highly nervous woman, who had lost her first and second children from this affection at about the same age as that at which this one was attacked. At the thirteenth day, twitchings of the eyelids and of the angles of the mouth were first observed; these rapidly developed into more general convulsions, which were repeated, later, every ten minutes. The infant was first seen on the sixteenth day of life. He showed then strong twitchings of the face, trismus, clonic spasms of the limbs, spastic contractions of the thumbs, and contracted pupils; the fit terminated, at the end of five minutes, in profuse perspiration. Two grains of chloral hydrate were given every hour. The convulsions diminished in frequency and intensity, and on the following day he was free from them. As the case was considered to depend upon dyspepsia, an antacid in the form of *magnesia usta* was then given, and no recurrence took place."—*London Med. Record.—Amer. Jour. Med. Sciences.*

Clinical Records.

ST. MARY'S HOSPITAL. W.

(Under the care of Mr. Norton.)

Reported by J. B. Coumbe, House Surgeon.

Comminuted Fracture of Thigh and Pelvis, &c. Recovery.

R. H., a van boy, age 15 years. Admtted May 2. This patient was walking along the street, accompanying an engine of which the fly-wheel, 2½ tons weight, fell off, knocking the boy down, and ultimately the edge of the wheel rested on his neck. He remained unconscious half an hour. Condition on admission apparently hopeless. Cold, pale, clammy, almost unconscious, pulse very weak and irregular. His thigh fractured in two places—at the upper third and just above the knee—which was comminuted, and felt like a doughy mass; the iliac bones more moveable than normal; a severe ecchymosis situated over the left lumbar region, and a contusion on the neck. On passing a catheter his urine was drawn off, mingled with blood. On examining him per rectum the left ischium sloped differently from the right, being most perpendicular.

His leg was placed between sand-bags, opium administered, hot bottles to surface generally. Next morning he had somewhat recovered from shock. Urine less bloody.

I could not pass the catheter in the evening as I had previously. Mr. Norton, on trying to pass the instrument, found that the urethra was pressed on by the now displaced pelvic bones, the rami of the pubes and ischium being broken across, the bones on the right side displaced downwards and in front of the left. The pelvic bones generally immoveable. After much trouble, under chloroform, an instrument was introduced and tied in, but it produced so much pain that the patient withdrew it in the morning. Temp. 102·4. The introduction of the catheter again caused as much trouble on the evening of the 4th. Temp. 103. He managed to keep the instrument in three days, though he complained bitterly of the pain; his urine becoming offensive the catheter was withdrawn, and he could pass sufficient urine by straining to keep his bladder from being excessively distended, which gradually improved. His temperature became normal and remained so, and he took his food and slept much better than could be expected. He was kept perfectly still in bed for seven weeks, with a seven-pound weight hung to his foot, sand-bags preventing lateral displacement of thigh.

Result.—He walked well, without a crutch or stick, in ten weeks, though the left limb measured as a whole one inch shorter than the right; normal curve of femur on injured side, perfect movement at hip and knee joints. Pelvic bones remained displaced, which could not be replaced. The anterior superior spine on the right side being an inch nearer the central line than left, gluteal fold half an inch lower on injured side, urethra adapted to new position.

Remarks.—This is one of those cases of severe injury terminating in recovery which we can only expect in the class of patients such as this was—a strong, careless, wanton boy, with a happy disposition, being able to bear mutilation to almost any extent compatible with life, as much more depending on the character of the patient as on the extent of injuries received.

FRACTURE OF THE ODONTOID PROCESS.

S. O. Vanderpoel, Jr., M.D., reports the following interesting case of fracture of the odontoid process, prolongation of life for six-and-a-half months, in the *Archives of Clinical Surgery*, June 15, 1877 :—

Frank Tinervian, æt. 21, single, United States, admitted October 12th, 1876.

Two weeks before admission patient fell from a waggon, striking heavily on the back of his head. Since that time he has been unable to bend his neck or turn his head, but keeps it all the time in an exceedingly erect position. Examination disclosed a peculiar deformity of the back of the neck, making it appear as if several vertebræ were displaced forwards. A closer examination caused the visiting surgeon to decide that only one vertebra was affected, the fourth cervical, which he supposed to be fractured through the right lamina, the fragment being dislocated to the right.

The patient was advised of the necessity of keeping very quiet and avoiding all sudden motions, and as he seemed inclined to take proper care of himself, he was allowed to sit up all day.

Oct. 21st.—Patient complains of a great deal of pain in the muscles of the neck, from his constrained position, he was ordered unguent belladonna.

26th.—His neck is still very painful, but less so than before the application of the belladonna ointment.

Dec. 4th.—All motion of the neck is painful. He has neuralgic pains about the shoulder and neck. Collodion vesicant was applied.

6th.—Pain has not been very much relieved.

Jan. 3rd.—Patient has had two or three falls and jars, but they have not caused any harm to his neck.

April 12th.—He has been quite comfortable for the last two months. The pain he had in his neck on the 6th of December, was relieved by the continued use of belladonna ointment, and since then he has not complained He has been doing general work in the ward until to-day, when he complained of great pain in his back and arm, and was put to bed.

13th.—It seems that the pain in the neck has been coming on for four days, gradually increasing in severity. 9 a.m.—Is complaining of intense pain, paroxysmal in character in his neck. There is hemiplegia of the right side with general anæsthesia of the right arm, which is congested and œdematous. 1 p.m.—There is now dysphagia, and diaphragmatic respiration, the thoracic respiration being suspended. Any movement of the body is referred with great pain to the neck. Patient assumes the left decubitus. The bladder and rectum act normally. Treatment, eight leeches, and a blister to the neck, with hypodermics of morphia. Pulse 52 and irregular, respiration 32.

14th, 6 a.m.—There is complete paralysis with general anæsthesia. The patient is cyanotic, and there are no respiratory movements of chest or abdomen. At 7.45 a.m., he died of apnœa.

Autopsy.—Twelve hours after death. Thorax, abdomen and brain not examined. The cervical vertebræ were all removed, when it was found that there was a fracture of the odontoid process, transverse in direction, below the articular facet which articulates with the avis. The transverse ligament was intact, and the upper fragment of the odontoid was held in place by it, and thus prevented from pressing against the cord. No dislocation or other fracture was found. The cause of death was meningitis of the cord, produced by caries of the axis. The deformity of the neck was due to muscular contraction, holding the odontoid away from the cord.

Remarks.—This case is one of more than ordinary interest on account of the extreme rarity of the accident, and the length of time that the patient survived after it. Prof. Willard Parker reported a similar case in the *New York Journal of Medicine* for March, 1853, the patient living for five months after the receipt of the injury, and during all that time, still continuing to follow an active occupation. In the same interesting paper, four other instances are mentioned, and two of the cases given in full. These cases go to prove that fracture of the odontoid process is not necessarily immediately fatal, as it is commonly supposed to be.

PROBABLE OVARIAN TUMOUR TAKING ON INFLAMMATORY ACTION.

The following abstract of a very interesting case, the notes of which were published by B. F. Hamilton, is taken from the *Philadelphia Reporter* :—

Mrs. B., æt. 34 years, always healthy, the mother of four children, the youngest five years of age. First noticed an enlargement in the right iliac region in the spring of 1876, which gradually increased, extending upwards into the abdomen. Health continued good, and menstruation remained regular until July 1st, when after walking several miles and becoming overheated, she was attacked with violent chills, headache, and abdominal pain.

Dr. Hamilton first saw her Sept. 20th. Found her much emaciated, with a very sallow, cachectic appearance, constant diarrhœa, and total loss of appetite. She was unable to leave her bed. There was no evidence of disease of the heart, lungs, liver, or kidneys. The abdomen was larger than that of a woman at full term of pregnancy, of a conical shape, with the apex just below the umbilicus, where there was some pouching and tenderness, resonance over the epigastric region, dulness, and distinct fluctuation everywhere below; changing the position of the body made no change in these respects. Examination per vaginam showed the os uteri pushed down to the vulva so firmly, that it could not be replaced ; any effort to do so caused intense suffering ; the sound passed two and one-half inches ; menstruation had ceased nearly three months before. In consultation with his partner, Dr. Moore, on analysing the symptoms carefully they excluded pregnancy, ascites, uterine fibroid, and malignant disease of the pelvic or abdominal organs.

Thier un ited opinion was to the effect that the tumour was one of ovarian cyst, which had taken an inflammatory action, and gone on to suppuration. The woman's strength was failing rapidly. Fearing further delay might lead to a fatal issue, they punctured with a large trocar at the most prominent point, giving support to the abdomen by means of a many-tailed bandage, and drew off two gallons of a greenish yellow and very offensive pus : on symptoms of weakness appearing, the canula was withdrawn, and the opening secured by a pad and bandage. Next morning another gallon of pus escaped. When the sac was nearly empty there was for a moment a flow of pure serum, indicating, in Dr. Hamilton's opinion, the rupture of a small cyst, which had resisted the inflammatory process. Under stimulating tonics, and a generous diet, she improved steadily. A drainage tube was inserted into the womb, which continued to discharge for five months. The woman made a capital recovery, regaining perfect health.

Typhoid fever has broken out at Bedale, Yorkshire, and is spreading rapidly. The market is now held at Crakehall, some distance out of the town. The Richmond Agricultural Society have decided to postpone their show in consequence of this terrible visitation.

Literature.

CARPENTER'S PRINCIPLES OF MENTAL PHYSIOLOGY.

THIS is the fourth edition of a work already favourably known to the profession as the production of one of the first physiologists of the age, but owing to the antecedents of its publication it has come before the public, and, indeed, to a great extent, before the profession, as a new book, and as such, therefore, we shall treat it. Its *raison d'être* in the present edition is obviously the agitation that has arisen in men's minds in consequence of the promulgation of certain doctrines by Professor Huxley, in which he has sought to prove that animals are automata, and, by inference, that man is an automaton also. We might pause to take exception to the word automaton as used in the discussion, which, as signifying a self-moved thing, is very suitable as applied to a certain construction of doll-figure, but undoubtedly thus signifies the very opposite of what Huxley intends us to understand. He means to teach the doctrine that man is a machine moved by external forces or stimuli; Dr. Carpenter, girding all his strength to attack this doctrine, urges that man is a self-moved being, or, properly speaking, an automaton. This doctrine of Huxley's forms the subject of the Preface to this edition, and Dr. Carpenter's handling of it affords the principal matter for analysis in his book. We cannot but think, however, that in opposing this doctrine Dr. Carpenter has confounded with it another, and a very different one, namely, whether man's actions are performed in obedience to motives or no. Our author asserts that many of them are performed without motives, in obedience to the self-determining power of the will; and, strange to say, seems throughout to think that in thus opposing the view that man's actions are invariably determined by motives he is opposing Huxley's doctrine of human automatism; not only so, but he actually thinks he has succeeded in proving that man's actions are, or may be, independent of motive, because he adduces instances or cases in which man voluntarily chooses his own path or course of action. This confusion of idea runs through a great deal of the book, and we think very much mars its philosophical value, and detracts much from the pre-eminent authority which it would undoubtedly have achieved if its author had confined himself to the scientific aspect of mental physiology. The true answer to Huxley, as it seems to us, and one which at once struck us while listening to his very able address at the Belfast meeting of the British Association, at which he publicly propounded his views, is this—that we can judge of mind and volition in animals only by an analysis of both as we find them in ourselves, and by a comparison of volitional actions of our own with similar actions performed by animals under circumstances similar to those which evoke them in ourselves. If an analysis of our mental states in relation to such actions leads us to the belief that we are possessed of minds which govern our volitional actions, we are bound by all analogy to infer that similar actions in animals, performed under similar circumstances, are so performed because that animals also are in possession of what is called mind, and that these actions of theirs are determined by mental states in them analogous to those determining the corresponding actions in ourselves.

It is contrary to all true principles of inductive science first to remove, as Huxley does, the animal body from connection with the organ which all physiological research teaches us is the organ of thought in man, and then, having produced certain automatic movements by the agency of another organ assigned to that purpose, to assert that all animal movements are independent of the first organ. Why, the self-same result would follow in the human system also. All observation teaches us that man no less than beast performs many movements, in fact, all those which we call instinctive, by the agency of his spinal cord, and continues to perform them without a brain, as in the acephalous infant, which, nevertheless, sucks the breasts; yet self-consciousness teaches us that others of our actions are volitional, and we are forced, therefore, to infer that corresponding actions are volitional in animals. Huxley's argument inverts true inductive processes; in such a case as this we are bound to argue from man to animals—from the better known to the less known—and not in the inverse direction, from animals to man. Dr Carpenter thoroughly investigates automatic movements from the scientific point of view, and his *resumé* of the present state of our scientific knowledge of these subjects (chap. ii., sec. 3.) is worthy of his fame; but we think his philosophical line of argument (p. 74, &c.) weak where he endeavours to prove that animals are not automata by showing exactly how far they are so—that is to say, in all actions dependent on the reflex activity of the spinal cord.

But, sharing thus thoroughly in Dr. Carpenter's opposition to Huxley's doctrine of automatism, whether human or animal, we are yet compelled to differ from our author as regards his second doctrine—that human actions may be independent of motive. We call it his second doctrine, or thesis; and disagreeing with him as regards this, while we agree with him as regards the other, we utterly fail to see how he has come to suppose that he has been discussing but one thesis all the while.

The sum total of our author's arguments on this point, viz., the volitional determination of man's actions apart from motive, may be summed up in a single quotation he makes (Preface, p. xx.) from Mr. Sedgwick—"No amount of experience of the sway of motives even tends to make me distrust my intuitive consciousness that, in resolving after deliberation, I exercise free choice as to which of the motives acting on me shall prevail." Certainly the adage must be true, "Quot homines tot sententiæ." For ourselves, after the most careful mental self-analysis, it is exactly to this consciousness that we appeal in proof of the assertion that never, under any circumstances, do we perform any action whatsoever of a volitional character without the presence of a determining motive; nay, more, that, to our mind, at least, the contrary is unthinkable. We have carefully analysed every instance Dr. Carpenter gives of what he considers to be action determined without motive, and in every instance have found the underlying motive at once recognisable. Take, for instance, his illustrative example (Preface, p. xxxiv.)—"Those most successfully engaged in the education of the young . . . . . watch for the dawn of this power of reflection and deliberation in the child, endeavour to strengthen his feeble resolution by judicious encouragement, lead him to reflect upon the consequences of his misdoing to himself or to others, and give additional force to his sense of duty by earnest appeals to it . . . . . and make him feel that it rests with himself by habitually fixing his attention upon what his reason and moral sense tell him he *ought* to do to be able to *will* to do it against his inclination." That is to say, in one word, they supply him with motives. Our whole judicial system of rewards and punishments is nothing else than appeal to motives, and a supplying of new motives, such as the fear of punishment, of shame, &c., when old ones, and better ones, have proved insufficient.

So when Dr. Carpenter says (Preface, p. xxxi.) that a confirmation is afforded to his view by the existence in language of the common expression "'I have no choice' in cases in which we feel it to be a necessity (whether physical or moral) that we should take a particular line of action," it is surely self-evident that if the necessity is moral the expression means nothing more than that the motives are overwhelming. The whole section on the Influence of the Will on Conduct is permeated by this, as it seems to us, erroneous philosophy; thus, he speaks (p. 413) of the will "modifying the relative force of motives" by contemplating some more persistently, and refusing to regard others; very true, so it does, but undoubtedly in obedience to motive. In the worthy man the motive will be the wish to act rightly, which will lead him to contemplate principally those motives which he knows tend to lead him in the right path, in opposition to certain other motives, such as the love of pleasure, ease, wealth, power, revenge, &c., &c., which may tend to lead him wrong; and, indeed, we think that much of what we consider erroneous in Dr. Carpenter's reiterated views on this point arises from his having strangely failed to see that the wish to act rightly is a motive, and in well-constituted and virtuous minds a very powerful one; and even habit itself becomes a motive in so far as it determines a certain *set* of cerebral organisation which demands activity or action in a certain direction as a discharge for what we may, for want of a better term, call its polarity.

It seems to us that while we are warranted in saying that man is free to carry out his choice, we are also bound by that

universal induction of our personal experience, no less than by a rigid self-analysis, to assert that this choice is invariably determined by motive.

Nor does this view seem to us in the least degree to militate against our responsibility for our actions, as Dr. Carpenter fears it will; for our part, the same self-consciousness that asserts our subordination to motive asserts also our responsibility for our actions, and we are as little inclined to question its dicta in one case as in the other. We think that a man is responsible for the weight with which motives, good or bad, present themselves to him; above all for his possession or non-possession of that supreme motive, which interweaves itself as a governing element with all other motives—the wish to act rightly. The presence or absence of this motive, with its weighty results, both direct and, by its leading us to admit or reject other motives, indirect, is, we think, the essential element by which a worthy character is distinguished from an unworthy; and for the presence or absence of this motive we think a man is responsible. Nay, more, our receptivity to motive, our subjective capacity for the appreciation of motive, is very much under our own control, and under the influence of this supreme motive, the wish to act rightly, this receptivity will become adapted to the appreciation of worthy motive, and insensible to unworthy; and for this training of our subjective receptivity, in obedience to this supreme motive, man is undoubtedly responsible. But would not the expression, "freedom of power," be philosophically more correct than the expression, "freedom of will?" "I can do it *if I choose*" is our correct expression of freedom, and the absence of the supreme motive, a *wish* to do right, is our severest ground for censure of an utterly worthless character.

We have been led into this train of analysis of Dr. Carpenter's views, which may perhaps seem even somewhat out of place in a medical journal, in consequence of the great extent to which we find this theory permeating the whole of Dr. Carpenter's book, and perpetually recurring in its otherwise truly philosophical and, we need hardly say, scientific pages.

Dr. Carpenter next attacks the materialistic philosophy which makes the mind altogether a function of the brain, and immediately afterwards discusses the spiritualistic hypothesis, which makes the mind a separate, independent, immaterial existence, and gives us the soundest reasons, of which, indeed, his whole book is an expansion, against this latter view or, at any rate, against the idea of the independence of mind of the body. Probably no man of fair scientific education thinks in these days that the mind is independent of the body; but many of Dr. Carpenter's most interesting facts and observations go far to prove, or, at least, lead one to suspect that the mind and body are more truly controvertible terms than we have been hitherto taught. It is true that such a view would necessitate a total remodelling of our ideas as to the nature of matter, and would require us to attribute to it a certain capacity for consciousness; but this is indeed what Tyndall's school assert of it, and physical science has already conducted us to the very verge of the conclusion which the celebrated Boscovitch long since reached from the metaphysical side—that material atoms are after all only localised expressions, so to speak, of a portion of the great aggregate of force in the universe. And what is mind? Can we offer a better definition of it than conscious force? But how become possessed of consciousness? That mystery rests with the Infinite author alike of force and mind; we have to deal with phenomena only, phenomena mental and physical alike. Dr. Carpenter has gone a long way (p. 11, *et seq.*) towards these views, and, we think, suggests, if he nowhere distinctly formulates, the idea that, after all, the conversion of mental volition into material motion, or the production of the latter as a result of the former, is no less mysterious than the conversion of molecular motion into sensation and consciousness, whence it would seem to follow that the latter doctrine is no more impossible, and no more to be dreaded, than the former. The truth is, all this discussion is about the *mode* of our existence, physical or mental, not about the *fact* of it; nor has it any bearing upon the great moral truths and responsibilities which underlie that existence, and are self-asserted by its self-consciousness.

In the remainder of the first book Dr. Carpenter treats of the General Philosophy of the nervous system in its relation to the mind and mental perceptions, instincts, and emotions. In these strictly scientific matters we have only to say that Dr. Carpenter is, of course, our standard authority, to be carefully studied by all who wish to make themselves masters of the subject, and that he who should undertake to criticise Dr. Carpenter's writings on such a subject would need first to have reached Dr. Carpenter's level as a physiologist. For ourselves, we have perused these chapters carefully as a matter of study, not of criticism, and we strongly recommend our readers to do the same, in which we can promise them a treat, as well from the graceful elegance of style as from the abundance of thoroughly digested and arranged material.

In this part, and throughout the remainder of his book, Dr. Carpenter's thesis is the extension upward of the reflex action of the spinal cord, first discovered, we believe, by Marshall Hall, in the first place to the sensory ganglia at the base of the brain, in which the nerves of the special senses have their central terminations, and with these to the corpora striata and optic thalami; and, secondly, to the cerebral lobes themselves. By a large induction he thoroughly establishes these two theories, showing that, as the spinal cord is the centre for excito-motor reflex action, produced without sensation by the checking at any point of an excitor impression in its upward course to the cerebrum, whence results something analogous to the explosion caused by the interruption of an electrical discharge in its onward path, so the sensory ganglia at the base of the brain are the centres of sensori-motor reflexion produced when the impression has been allowed to proceed on to the sensorium, and so awaken sensations, but has not yet reached the cerebrum, and accordingly has given rise to no ideas; and so, further, that the cerebrum itself is the centre of emotional and ideo-motor reflexion, excited by its automatic response to impressions when from any cause the will is in abeyance and its governing and directing power over the muscular system, or over the thoughts and feelings, can no longer be exerted. Further, he shows that ideas are only generated when the impressions transmitted upwards to the cerebrum, or the molecular changes arising therein, are reflected downwards again to the sensorium, so as themselves to became the objects of our consciousness, a result by no means necessarily following on the occurrence of cerebral molecular change, whence arises the singular phenomenon of mental activity without our consciousness of it, known by the name of unconscious cerebration. The investigation of these various states occupies a large portion of this charming book, and is illustrated by innumerable cases of spontaneous, or even of artificial, production of the various phenomena, some of them of a strangeness almost surpassing belief. Dr. Carpenter adduces (p. 113) the phenomena of memory as the principal basis on which rests this theory of the reflex action of the cerebrum. For since it is clear that our conception of a remembered object is very nearly the same as our perception of it when an object of sensation, it is impossible to suppose that two states so closely related as these can be due to the instrumentality of two different seats of consciousness, whence the inference is irresistible that the same sensorial condition or changes that are due in the one case to the presentation of objects of sensation are present also in the other, where their origin can only be due to molecular changes within the cerebral lobes or organs of thought. The interesting case of Sir John Herschel is introduced as an illustration of this theory, with the keen speculations thereon of the scientific subject of the impressions.

The next step in the process is found in the natural inference (p. 157). "But if cerebral (ideational) states can *reproduce* sensations they can also *produce* them." And this thesis Dr. Carpenter proceeds to develope by a vast induction and a train of close and well-reasoned argument, shewing that the phenomena of mesmerism, electro-biology, and somnambulism are all due to the production of such ideational states, and that dreams, ecstasies, visions, apparitions, &c., are one and all subjective phenomena merely, due to an excited condition of the cerebral lobes, the consequent molecular changes in which, being reflected downwards to the sensorium, give rise to subjective sensations only too readily referred by the subject of them, and even by others, to real or objective causes.

Here and there we would, of course, differ from our author on a matter of opinion, as when he maintains (p. 190) that the sense of distance, though acquired by the human infant, is intuitive in some of the lower animals. We cannot believe that this sense is arrived at by the two beings by a different route, though one may reach it more rapidly than the other. Professor Abbott, of the University of Dublin, rightly, we

think, inferred, after careful observation, which most of us have probably had opportunity to verify, "that there is an independent visual perception of distance and magnitude in the earliest infancy prior to any association with touch or locomotion." True it is that distance cannot be seen directly, but Dr. Carpenter states (p. 199), as we have long thought, that a certain muscular sense in the motor muscles of the eye-ball, particularly in the internal recti, or converging muscles, is the origin of the sense of distance as regards near objects, while comparison of size, illumination, &c., gives a relative estimate of that of more remote objects. This conclusion may be verified by observing how completely we lose the sense of distance of near objects on shutting one eye. But undoubtedly the appreciation of distance must be due in the chick to some similar muscular sense caused by the act of focussing the eye by the peculiar muscle possessed for this purpose by birds.

Our author again states (p. 190) that "there can be little doubt that, in the earlier stages of its existence it (the infant) is incapable of distinguishing between a picture and the solid object which it represents." We doubt this; our own careful observation has convinced us that an infant is long before it sees in a picture any resemblance whatsoever to the object represented thereby.

Again, Dr. Carpenter (p. 228) seems strongly inclined to accept the view of J. S. Mill, as modified by Herbert Spencer, regarding the origin of our primary beliefs, viz., that "the intellectual and moral intuitions of any one generation are the embodiments in its mental constitution of the experience of the race." We can hardly accept this; we accept to a very considerable extent the doctrine of inherited race experience; but we fear that the authority or arguments of Mill, Spencer, and Carpenter, all together, will hardly persuade us to the view that, *e.g.*, our belief in our own present existence, given on p. 226 as the first of these primary beliefs, is due to an embodiment in our mental constitution of the past experience of our ancestors, or that, in fact, we do not arrive at it by a far shorter as well as more satisfactory route, viz., our own present experience, which is open, we presume, to us now as much as it formerly was to them. Similarly, as regards numerical intuitions, our own belief that 2 + 2 = 4 is due, we consider, to our power of appreciating this statement of a necessary objective truth; the statement itself carries with it the conviction of its truth—nay, of its necessary truth, though not of our necessary capacity to comprehend it; when stated and understood it is an experience, no doubt, but a necessary experience, *i.e.*, we recognise the fact that it could not be otherwise, and hence such an experience is different from one which might have been otherwise.

Geometrical truths afford a rigid test of the truth of our view, for if race-experience means anything real it must mean the experience of an individual's personal ancestors, not of the ancestors of his neighbours, which obviously cannot affect his intuitions; yet geometrical truths—say, that the three internal angles of a triangle are equal to two right angles, are apprehended as necessarily true the moment they are intelligibly presented, even by, say, an intelligent peasant, not one of whose ancestors, as far back, if you will, as Mr. Darwin's ape, ever had the faintest glimmering of geometrical truth previously.

Again, we do not think that (p. 243) "Conscience, or the moral sense, has been usually considered by moralists and theologians as the faculty which unmistakably declares *what is right*." We certainly cannot answer for the theologians, but Butler makes the essence of conscience consist in its self-assertion of authority, independent of the question whether, being well-informed or ill-informed, its dicta are absolutely right or wrong in themselves.

Chap. IX., on the Will, is very valuable, though it presents throughout the evidences of the unphilosophical idea of the author, as we hold it to be, that the will can act independently of motives, as where he asks (p. 392), evidently intimating that this is his own view, "Is it a power which, being completely independent of these conditions (physical antecedents), is capable of acting *against* the preponderance of motives." He thinks it is, because a man can modify the relative force of motives by the mode in which he contemplates them (p. 413). So he can, but he must have a motive for so doing. And he says that, even "in the discussion of a question of intellectual truth, the will has the power of keeping some considerations out of view, and thereby diminishing their force." Perhaps it can, but not without conscious dishonesty, and certainly not without some strong motive to such dishonesty; and this motive we have generally found to be the fear lest if the point in question were proved it might be found to involve the demonstration of some further point to the proof of which we entertain a very strong objection, based, of course, on some further motive, and usually one not difficult to assign. We have not space farther to discuss this question, and can only hope that Dr. Carpenter will reconsider his views on this point, with a determination more rigorously to track motives to their hiding-places. His section on Our Responsibiliiy for our Beliefs, showing clearly that we are responsible for that habitual attitude of our minds on which our acceptance or rejection of truths depends, is, we thank, a most valuable one, and one that puts in a true light a difficult point. Reliance on authority and passive acquiescence in what we may have been taught are shown to be the leading habits of mind on one side, which thus prevent our arriving at the truth, and for which we are undoubtedly responsible, while antagonism to such habits may lead us too far on the other.

The writer has elucidated a valuable idea in his proposition that self-discipline in our reasoning processes is an element of much importance to the well-being of our posterity, since it "acts *downwards* in improving the mechanism that evolves the 'self-evident' material of our reasoning processes, as well as upwards in more highly elaborating their product, so that the race, like the individual, emancipates itself from early prejudices, gets rid of worn-out beliefs, and learns to look at things as they are, rather than as they have been traditionally represented" (p. 484).

The sections on unconscious cerebration are of the highest value as elucidating this subject, which is one not yet sufficiently recognised even by the profession, while to the public it is almost utterly unknown.

The analysis of the influence of suggestion in the production of the phenomena of electro-biology is also valuable, though we think that some of the phenomena adduced in this chapter require further investigation; there are some residual phenomena unaccounted for by suggestion. The cure of opacity of the cornea by Mr. Braid, when the subject of it was being treated by him only for pain in the shoulder (p. 609), will hardly be accounted for by suggestion of ideas.

We think our author has rightly distinguished (p. 692, &c.), between the laws of Nature as expressions of phenomenal uniformities, and efficient causation as the necessary result and outcome of our conception of force; the laws of Nature only formulate sequences, but the scientific investigator cannot rest here without tracing the relation between cause and consequence as arising in the transmission of force or energy, under the same or a different form, from one point of the cosmos to another. But we think our author has failed to perceive that there are other laws of Nature than those positive laws, as we should call them, that formulate sequences; that there are necessary laws, negative laws, as we should call them, such as Newton's first law that a body at rest will remain at rest for ever, and a body in motion will move for ever unless some counter-force be applied to it. Our recognition of the truth of such a law is independent of experience; the law could be predicated *à priori*, since it merely denies the power of a body to move itself, independent of force, and this is involved in our very idea of matter.

In conclusion, we can only say we have read this book with intense interest, and commend it to our readers no less for the valuable light it throws on all the subjects of which it treats than for the mental exercise which a perusal of it will afford. Mental physiology is a subject which ought to be more widely studied by our profession than it has yet been, and no better work on the subject than this could be selected to aid the study of it.

A.

NOTES FROM A DENTIST'S CASE-BOOK. (*a*)

THIS pamphlet consists of a series of papers originally printed in a dental contemporary. They are composed mainly of narratives of interesting cases, with a running commentary on their pathology and treatment. Nearly every topic in the domain of dental surgery is brought

(*a*) "Notes from a Dentist's Case-Book." By Felix Weiss, L.D.S,R.C.S., M.O.S., &c. London: J. and A. Churchill.

more or less into discussion; and as the author has enjoyed great and varied experience, and possesses the power, not only of profiting himself by this experience, but of communicating his knowledge easily to others, the materials he has here compiled may be studied with interest and advantage both by the medical and dental reader.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

The Medical Press and Circular

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 29, 1877.

THE DEGENERATION OF HUMAN TEETH.—I.

WE have often been surprised that the causes which have led to the present degeneration of human teeth have not attracted the serious attention of dentists, and other members of the medical profession. It may be that the former class of practitioners are so occupied with meeting the demands made upon them for the extraction of decayed and the insertion of artificial teeth, as to have little time for inquiring into the subject. Now, however, that the majority of dentists are well educated men, and are well qualified to turn their attention to something more than the mere mechanical departments of their profession, it is to be hoped that some advancement will be made in our knowledge of the causes and true pathology of a disease from the ravages of which there is scarcely a family in the kingdom exempt. What these ravages are, and the alarming extent to which they have reached, are so generally known that any particular reference to them is unnecessary. They have indeed become so common, that our very familiarity with them has made us indifferent to the fact and the evils that may result from it. This premature decay of teeth is not confined to any one class, for the rich and the poor appear to suffer alike. Youths who have not yet stepped into manhood with half their teeth nearly gone, and girls scarcely out of their teens applying to the dentist for a new set! Nor is this general prevalence of dental caries confined to this country. The Americans, and most of the Continental nations, are not more fortunate than ourselves. A distinguished dentist in Philadelphia remarks that from the great grandparents to their children, and their children's children, there is a general continuous deterioration in the quality of their teeth through the successive generations.

"All the facts of professional experience which have been gathered, all the improved modes of practice which the best heads and hearts have thus far developed, have not sufficed to stem the tide which seems destined to render the human race edentulous."

"Surely," says Mr. Carter in the current number of the *British Journal of Dental Science*, "some law of God and Nature has been outraged to bring upon our children so dire an affliction." Unfortunately, this decay of teeth is only part of the evil we have to contend with, for independently of the disfigurement, and other inconveniences resulting from it, we have to take into consideration its injurious effects upon the digestion and assimilation of food, and consequently upon the general health of the individual.

To what causes, then, are we to attribute this general degeneration of the teeth among civilised nations? As no one has taken the trouble to seriously inquire into these causes, we must not wonder that a number of hypotheses have been hastily advanced in explanation of one of the most remarkable features in the *physique* of a large portion of mankind. It has often been asserted that the large amount of sugar now eaten by the public compared with what was consumed by our ancestors, has much to do with the evil of which we are speaking. It is doubtful, however, whether this practice does anything more than accelerate the progress of the caries that has originated in other ways. Neither are people who take much sugar particularly subject to, nor those who take little or none, particularly exempt from this affection; and it is well known that no people have better teeth than the negroes at work in the sugar plantations, who consume a large amount of this substance. Nor can we conceive that Nature would have made sugar an important ingredient of the nourishment she has provided for the new-born infant, if she did not intend it to be always an essential article of food for the future man. A more rational argument is that which refers the degenerating condition of human teeth to those injurious influences which are at work in all our great centres of population, such as overcrowding, impure air, insufficient food, &c. But this explanation is by no means a satisfactory one, for the disease is just as rampant among the middle and wealthier classes, who are little exposed to these conditions, as amongst the most destitute section of the community, and as prevalent in the village as in the city slums.

No people, remarks the writer above-mentioned, live in more crowded and unwholesome cities than the Chinese. They spend their lives in conditions the most repugnant to health, without drainage or ventilation, feeding, in many instances, upon the most obscene food, giving rise to leprosy, gangrene, necrosis, ophthalmia, and terrible forms of skin diseases, and yet their teeth remain good.

On the other hand, the rural populations of Germany and France now suffer to such an extent that a sound set of teeth is a rarity among them; and almost the same may be said of our own farmers and their families. Indeed, Dr. James A. Salter, the eminent dental pathologist, states that in this country the labouring classes in purely agricultural districts are afflicted with caries of their teeth beyond all others.

Nor can this great and growing evil be traced to the prevalence of any particular disease or class of diseases; although there are several constitutional affections, the operations of which should not be lost sight of in discussing this subject. Among the local and constitutional diseases, says Mr. Sewill, which favour the onset and progress of caries, "may be mentioned all the varieties of stomatitis among the former, and among the latter, scrofula, syphilis, phthisis, chlorosis, and chronic alcoholism." But the great question before us is not whether a few cases of dental caries may not be traced to the baneful influence of one or other of those affections, but whether they are accountable for the enormous number of cases that are constantly coming under the notice of the dentist or general practitioner. If this were really the case, then it follows that the general health of the community must be in a very deplorable state. If every one who runs to the dentist with half his teeth gone, or fast going, is to be considered as the victim of some of those constitutional maladies to which dental caries has been attributed, then must we admit that we have all along been labouring under a delusion with respect to the reputed improvement in the health of the public, and that these maladies are fast undermining the constitution of all classes of society.

Fortunately for the future prospects of the next generation, we cannot accept this argument either; for it is well known that all these constitutional affections are most prevalent in crowded cities and among the poor, whereas the disease now under consideration is just as rife in the country as it is in the town, and among the rich as among the poor. Besides, in a large proportion of cases, caries of the teeth cannot be traced to the existence of any constitutional disorder whatever.

But the most remarkable and significant fact in connection with this question is, that the improvement in the general health of the public, and the degeneration of their teeth, seem to have advanced in an inverse ratio. The most eminent authorities in hygiene and sanitary statistics agree that a very great improvement has, within the last fifty years, taken place in the sanitary condition of the people. The general mortality or death-rate has diminished to a considerable extent; disease is neither so prevalent nor so fatal as it was formerly; the average duration of human life has been remarkably increased. We live more by rule, drink purer water, breathe purer air, and are less exposed to the ravages of epidemic disease than our ancestors were; and yet, *pari passu*, with all this improvement in the health and average longevity of the public, we find that the degeneration of their teeth has been steadily increasing, and to such an extent as to suggest the propriety of making a systematic investigation into the causes which have led to it.

SANITATION AT GREAT MASSINGHAM.

Whatever progress sanitation may have made in our great cities, it has not made much way in many of our rural districts. At least, it would appear so if we may judge from the report which has been made by Dr. Thorne, the Local Government Inspector, to the Local Government Board, with respect to the extensive diffusion of scarlet fever in Great Massingham, and other villages in the Freebridge Lynn rural sanitary district. It is difficult to say which is the most deplorable, the sanitary condition of the district, or the parsimonious negligence of the rural sanitary authority. The Great Massingham district is just one of those districts which afford a wide field for sanitary improvement. The houses are scattered round numerous open spaces. These spaces are to a great extent occupied by shallow sheets of water, which, besides causing a nuisance, owing to the sewage they receive, greatly increase the natural dampness of the soil. The drinking water is partly derived from shallow wells in the sand and gravel which are so situated that they must be often fouled by surface soakage, while one of them which is much used, is situated close to one of the pools of water which is a receptacle for sewage. In many instances there is no proper drainage, and the slops, liquid, filth, &c., find their way into privy pits, waste places, the ground round the house, or the pools just mentioned. There are only common privies, and so few of them that from three to six cottages have but one between them. Some are also in such a filthy and dilapidated condition as to be unapproachable; and from this cause several households have been compelled to do without any closet whatever. The very primitive state of the village is also shown by the fact that until 1875 the causes of death were but rarely certified. Such was the condition of this district when in 1874 scarlet-fever became epidemic in it. In the year previously, the rural sanitary authority of the Freebridge Lynn Union appointed a medical officer of health for their entire district, as well as an inspector of nuisances. Both appointments were made for one year, and with so much success as regards the sanitary administration of the district, that the authority above-mentioned thought they might the following year dispense with the services of both the medical officer and inspector. At all events, in 1874 they did not renew their appointment. The medical officer was only to act when "specially called in," for which he was to receive a special fee, while the two relieving officers were appointed to act as inspectors of nuisances. From this moment, says Dr. Thorne, the sanitary condition of the union became characterised by neglect of the gravest description. Not until the first epidemic of scarlet fever had broken out several months was the medical officer of health requested to visit Massingham. He very properly pointed out to the sanitary authority the uselessness of such a visit, adding that "the way to stop preventible disease is to attack the first case, and not to wait till the whole village is ravaged before steps are taken to arrest it." Other circumstances indicative of great negligence on the part of the sanitary authority might be mentioned. Suffice it to say that nothing appears to have been done with respect to this wide-spread epidemic until May, 1877, when the rector of Great Massingham took the matter up, the medical officer

for the third time visited the place, and reported that upwards of 100 cases of scarlet fever had occurred in the village, that other villages were infected, and that the district was a source of contagion to the whole of the western division of the county. Be it observed also that these three visits of the medical officer to Great Massingham was the whole of his work for the Freebridge Lynn sanitary district for nearly three years.

As a contrast to the above, Dr. Thorne draws attention to the sanitary administration of King's Lynn with regard to infectious diseases. Here there was an arrangement whereby the poor-law medical officers received a fee each time they reported a case of infectious disease to the medical officer of health, and by this and other means the sanitary authorities were informed of all the cases of scarlet fever which appeared in King's Lynn. Precautions were then taken to limit the epidemic, and with the result that no spread of the disease occurred beyond the house first affected, and nearly every case was a slight one. "It is impossible," remarks Dr. Thorne, "not to connect the course taken with the notable restrictions of the disease in King's Lynn as compared with its wide-spread prevalance in the Freebridge Lynn sanitary district, where no similar course was taken." The above facts are so significant of the imperfection that still exists in the sanitation of our rural districts that comment is almost unnecessary. It is quite evident from these disclosures, as well as from others to which we have had, on former occasions, to draw the attention of the reader, that the machinery of our sanitary system is not only faulty in its construction, but in many respects in bad working order. That an epidemic should go on raging in a district for two or three years with little or no notice being taken of it is scarcely conceivable in these days of sanitary legislation. It is also evident that the appointment of medical officers of health must not on any account rest with the rural sanitary authority, and that before long a more centralised system of sanitation will have to be adopted. It is to be hoped that the day is not far distant when, as Dr. Richardson suggests, we shall have a Minister of Health, or when at least, the sanitary welfare of the nation will, under medical guidance be, as Mr. Well's remarked the other day, provided for by Parliament in such a manner as to prevent the occurrence of such a scandal as that which has been brought to light by the Report of the Local Government Inspector.

CITIZENSHIP IN SANITARY WORK.

There is an awakening interest at the present time in sanitary work, which is evinced by the number of sanitary exhibitions and new patents; by the lay press in reporting the proceedings of medical meetings, and by the formation in many towns of societies for the distribution of tracts on subjects affecting the public health. Medical practitioners can materially help on this movement, and there is one subject on which the public and especially the lower strata of it, require education, which might be taken up with advantage by our brethren, that is, to impress the duties of citizenship in the prevention of diseases of an infectious or contagious nature.

How may this be done? The influence of the medical mind upon our national manners is very much greater than is generally believed, and every medical man has the power of influencing a certain circle, so that with the aggregate of circles we obtain an influence over the whole mass of the community, and thus, if each medical man availed himself of the opportunities within his own sphere of action we should have a combined effort in this direction.

What is the theme? It is a very wide one, and of interest, and in special cases, where there is time and talent for the work, it might be embraced in popular lectures. Using the language of commonplace, we know that health is the greatest of all blessings—the principal source of enjoyment and happiness, but its value is relative, according as it affects different classes of society, and as Dr. Guy says—"To the rich, who need not work, and to the poor who must, health is equally the source of comfort and enjoyment; but to the man who must labour that he may live, health is this and something more—it is the means by which he earns his living." Disease, and especially such maladies as fever, small-pox, dry up the source of his subsistence, exhaust his savings, plunge him into debt, threaten him and his with destitution and the poorhouse. If he recovers his health he may have lost his occupation, and will have to spend his convalescence in a wearisome and perhaps a fruitless search after work. If disease attacks his family but spares himself, it is still the greatest calamity that can befall him and them. The minor household virtues have no worse foe, education no deadlier enemy, intemperance no surer ally, than sickness when it invades the humble dwellings of the poor.

Here is a theme capable of expansion. It does not require eloquent lanquage to illustrate its truths, and should any of our readers feel inclined to devote themselves to this meritorious work weoffer a few suggestions as to the method. In the plainest words, and avoiding all expressions of a medical or technical nature, the public should be told that the prevention of infectious or contagious disease is a duty they owe both to themselves and their neighbours—to themselves to save their own lives and the lives of their families, and to their neighbours in discharge of the command of God that "we should love our neighbours as ourselves"—that we should strive to save our fellow-citizens from suffering, from pecuniary loss, by adopting those precautions which have proved successful in arresting the spread of infectious or contagious diseases. It will then be necessary to explain what is meant by those terms, to tell them it applies to those affections which may be communicated from one to another, either by actual contact, as touch, or by means of what are termed poison germs, or small invisible, odourless particles, which set up in the body an action somewhat similar to that of yeast. Everyone knows that a small quantity of yeast will rapidly develop into a large bulk, and thus, by a similar process, a small bit of matter absorbed into the system will cover the body with nasty hard sores or pimples, as may be seen in small-pox, or may show istelf in a general red rash, so that the patient looks like a boiled lobster, as may be seen in scarlet fever.

By a natural transition from small-pox we are led to

vaccination, and from vaccination to the various preventive measures, a few of which we may mention.

1. That the services of a properly qualified medical man should be procured, and his instructions faithfully carried out.

2. That sympathising neighbours should not be allowed to fill the sick chamber.

3. That isolation should be carried out, and in many cases the patient removed to a public hospital.

4. That disinfectants be used.

5. That in cases of scarlatina other children should not be sent to school.

There are many other points which may be filled up by each individual at will, but we are only giving an outline to show the scope and wide field open to him. Much might also be done in reference to infant mortality, and in impressing the necessity of saving infant life. By death, and by the early death of the young growing population, capital is wasted in the shape of prospective labour, and thus this becomes almost a State question.

We have said enough to direct attention to this important channel for medical philanthropy. It has been suggested lately to enforce the registration of such diseases by penal enactments, so as to assist medical officers of health in the discharge of their duties; but we are not in favour of repressive legislation, for though in other countries such a system may be necessary, and may suit their social requirements, still in England it is opposed to our traditions, and penal clauses pressing on the domestic circle are looked on with suspicion. It is a theorem of English life that an Englishman's home is his castle, and we hope the idea will always exist. We would prefer to trust to education to induce the public to look upon medical officers of health as their best friends, to teach society, especially its lower formations, that disease, and especially preventive disease means premature death, destitution, misery, the workhouse; that it paralyses labour and wastes capital; that their own interests are best consulted by facilitating the working of the Public Health Act, and in rendering every assistance in their power in the eradication of those diseases we have mentioned.

Notes on Current Topics.

Medical Reform and the British Medical Association.

We last week remarked upon the fact that the British Association, at the instance of the Editor of its journal, has thrown overboard the committee who desired to follow up its previous efforts in favour of direct representation of the profession in the Medical Council and reformed medical education, and has declared the protection of the profession against the competition of quacks to be of greater importance than these objects. As our readers are aware, the most influential section of the committee resigned on the spot, and the medico-political functions of the Association may be said to be suspended until a new committee can be got together, who will devote themselves, with due ardour, to the protection of general practitioners from prescribing druggists. The following paragraphs from the rejected report will serve to show the ex-committee had a superior ambition to this. They say they have deemed it advisable to refrain from pressing forward the Medical Act (1858) Amendment Bill, introduced in April, 1873:—

That Bill provided for the admission to the General Medical Council of direct representatives of the profession in the proportion of one-fourth of the members of the Council, and would give to the Council, thus modified, more important and greater powers than it at present possesses. It would enable the universities and corporations to form conjoint examining boards for each division of the kingdom, but in case of failure to do so in either division of the kingdom, the General Medical Council would then be empowered to form a conjoint examination board for such division of the kingdom.

It provided that the conjoint boards should be formed on the principle of equal fees and equal examinations, so as to avoid the scandal of men rejected by one examining body gaining admission to the profession, without further study, through the less stringent requirements of another. Above all, it enjoined a practical as well as a theoretical examination, and a sound preliminary general education in all candidates for the medical profession. The provisions of the Bill were settled in the interest of the public equally with the profession, both interests being indissolubly connected; it aimed at securing those afflicted by illness from the inefficient treatment of incompetent men, and protecting them from the designing craftiness of charlatans, while it tended to elevate the profession socially, and to increase its influence by the weight of extended general and professional attainments.

Your committee, being aware that the English medical authorities were both active and earnest in their efforts to combine, have, in consequence, studiously refrained from embarrassing their proceedings by separate parliamentary action, notwithstanding the distinct declaration in debate by an eminent member of the House of Commons in favour of the general measure of the Association in preference to the piecemeal legislation by little isolated Bills required by various corporations to enable them to combine in a conjoint scheme.

Your committee are happy in the knowledge that their forbearance has borne good fruit, for they have to congratulate the Association on the success which has at last crowned the efforts of the universities and licensing corporations of England in establishing a conjoint board of examination for their division of the kingdom. A great advance has been thus effected; the separate licences of the English corporations will no longer be attainable, and, as regards English qualifications, the possession of a licence in one branch of the profession will no longer enable the owner to practise all its branches. For the future, if the scheme be carried out, every practitioner will be fairly examined in England in all departments of professional knowledge.

Your committee regard this as a most important, though partial, recognition of one of the objects for which the Association has so long contended. Unfortunately, it does not apply to Scotland, where the temptation to secure separate qualifications will now have greater force—nor yet to Ireland, where the Apothecaries' Society may still grant its separate licence for the modest sum of half-a-guinea, and so qualify its fortunate possessor to be placed on the *Medical Register*, enable him to practise all branches of the profession, and that in every division of the kingdom.

Your committee feel that, as long as this state of things endures, and they have little hope that the example of the English medical authorities will be voluntarily followed either in Scotland or in Ireland, so long the Medical Reform Committee must represent the influence of the Association, and continue its labours until, through pressure,

conjoint boards of examination, framed on the principle of equal fees and equal examinations, are established in each division of the kingdom.

Your committee again desire to submit to the Association whether the principle of direct representation is one for which they are still to contend. The Apothecaries' Society of Dublin, which comprises a very small number of shareholders—some of them women, and some, it is said, with more than one share, granting its licence for half-a-guinea—nominates a representative, and will always do so under the present Act, on the General Medical Council. The representative has the special interests of his own corporation to watch over and maintain. The great body of the medical profession, with no private interests to serve, including the important provincial medical schools of Manchester, Liverpool, Birmingham, Bristol, and Leeds, have no voice, no representative in the General Medical Council. In the matter of medical reform, it is for the Association to decide whether the struggle for this bare meed of justice is still to be continued; if so, there is no cause to despair: the Association struggled for 26 years before the Medical Act of 1858 was obtained.

To have abandoned these principles in favour of a mere fee-saving policy is a melancholy decadence for the Association, and we certainly hope that some means may be found in the Council of the Association to modify a hasty and ill-judged resolution arrived at by a petty vote of uninfluential members at the Manchester meeting. Even if the Association should succeed in extinguishing the counter-prescribers, and if all its present ambition should be thus satisfied, it will gain no "honour," but will stand before the public and Parliament rather as a doctors' trades union than as an organisation anxious for the purity of medical education and the raising of the scientific status of the profession.

Aconitia in Tic Douloreux.

THE remarks which Prof. Gubler recently made on this subject at a meeting of the Société de Thérapeutique (*Gaz. Hebd.*, Feb., 1877), have attracted some attention. Although Prof. Gubler thinks this medicine should not be given to persons suffering from disease of the heart, on account of the cardiac disturbances it is apt to produce, yet, in his opinion, too much distrust is often shown with regard to a drug which is by no means a dangerous one when used prudently. It should, however, be prescribed in solution, as if given in the form of pills or granules, absorption may not so readily take place, and then encouraged for some time by the nullity of their effects, the medical attendant may be thus led to give a mischievous dose. The aconitia of Hottot and Liégeois is excellent, and that of Dequesnel possesses great power, so that a quarter of a milligramme may suffice as a dose. Of the value of this nervic remedy Prof. Gubler speaks in the highest terms, and states that he has never known a neuralgia of the fifth pair, even tic douloureux, resist aconitia. Some years ago he saw a patient who had long been the victim of obstinate trifacial neuralgia, for the relief of which Nélaton excised all the nerves affected. The operation only gave temporary relief, and the patient declared she would commit suicide, when, by the advice of Debout, Hottot's aconitia was tried, and after five milligrammes had been taken the patient suffered no more. In another patient, who had suffered agonies night and day for three months, six milligrammes completely dissipated the pains. It is not, however, so successful in other forms of neuralgia, and it seems to be more beneficial in the congestive forms of the trifacial variety. Although the disease may be owing to organic lesions which pursue their course, Prof. Gubler is of opinion that if we succeed in relieving for a long time the functional disturbances a cure may be effected. Many diseases which, at least present organic changes, are at first of trifling importance; the neurosis in them engenders the lesion. Locomotor ataxy, for example, is at first a neurosis, and it is only at a later period that atrophy of the nervous tissue takes place. Nutrition is at first affected, the tissues being only secondary. It is on the section of a motor nerve that muscular atrophy supervenes, cellular tissue filling up the vacuities. M. Moutard-Martin agreed in the opinion that the progress of lesions may be arrested by acting on the pain. In this way he has definitely cured cases of tic douloureux by repeated injections of morphia.

These remarks of Professor Gubler, which are quoted more at length by the *Practitioner* and *Medical Times and Gazette*, are very interesting, both from a therapeutical and pathological point of view. The efficacy of this drug in some cases of neuralgia has been long acknowledged. Murray, Fleming, and Hufeland regarded it as a remedy of the highest value. Professor Gubler's experience with regard to aconite being more useful in the congestive form of trifacial neuralgia corresponds with that of Fleming, for this physician found that its internal employment is more likely to be beneficial when the affection depended upon inflammation, either in the painful part of the nerve, or higher up in its course. Perhaps, therefore, the thermometer may enable us to decide whether aconite should be given for this disease or not. Sydney Ringer insists strongly upon this point with regard to the aconite treatment of inflammations generally, but he says little or nothing about the utility of aconite in the treatment of neuralgia.

The influence of pain as a factor in originating or in aggravating organic disease is a contingency which is too often lost sight of. But how far pain may actually generate disease it is difficult to say. Perhaps Prof. Gubler has over-estimated this influence, for we must bear in mind that as we do not have the opportunity of examining such lesions as locomotor ataxy in their earliest stages, it is impossible to be sure whether the pain preceded the lesion, or the lesion the pain. That however severe and continuous pain will react, as it were, upon the nutrition of the tissues supplied by the affected nerve, and originate or aggravate organic affections, is so probable, that the alleviation or removal of this symptom, independently of the causes which may have originated it, should be always an important indication in the treatment of disease.

Hospital Mortality.

MR. LAWSON TAIT, F.R.C.S., of Birmingham, who has interested himself very much on the subject, read a paper before the Science Section of the British Association for the Advancement of Science, held last week at Plymouth. He said, in order to obtain a proper estimate of the quality of the work done in any general hospital it is necessary to obtain exact information concerning

three factors; and it was very much to be regretted that the method of keeping hospital records was generally so careless and inefficient that it was a very difficult matter to obtain correct data. After a great deal of trouble, however, he had been able to extract trustworthy figures from the records of 179 hospitals for a period of six years. The three factors required were the average daily population of each hospital, the actual number of admissions from the 1st January to the 31st December, and the total deaths occurring within the walls of the building. By dividing the admissions by the average population, a figure was obtained which might be termed the "activity" of the hospital, that is, the number of cases treated per annum in each bed, and dividing 365 by the result, gives the mean residence. The death-rate is to be calculated as a per-centage on the admissions. Splitting the hospital up into four groups, according to size, he found that the activity diminished and the mortality increased just as did the size of the hospital. Selecting amputation below the knee for injury as the best instance for contrasting results, the author produced the following remarkable results, and the figures showed conclusively that the causes of the increment of mortality are intrinsic to the large hospitals, and therefore entirely, or almost entirely, avoidable:—

Hospitals.	Activity.	Gen. Mort.	Leg Amp. Mort.
Under 20 beds . . .	15·2	5·17	23·52
20 to 100 beds . . .	10·86	6·6	28·3
200 and over . . .	12·04	7·98	42·37
Leeds Infirmary . . .	14·21	6·78	20·75
Birmingham General Hospital	13·08	8·07	42·32
St. Thomas's Hospital, London	9·03	12·13	47·05

In the discussion which followed, Dr. Farr of the Registrar General's Department said they were much indebted to Mr. Lawson Tait for his able paper, who had condensed into his paper the results of an immense inquiry, which had required a great expenditure of labour. Those who looked into the matter as Mr. Tait had, must come to the same conclusion as he had. He (Dr. Farr) was the first person, he believed, to call attention to the effect of large hospitals upon mortality, and now that the inquiry had been extended by Mr Tait, the conclusions that he had come to could not be disputed by anyone. It had been conclusively proved that surgical patients suffered from being kept together, and he hoped this would affect the whole medical and surgical policy. Hospitals in some shape or other were necessary, but he thought it would be better if a great number of the poor were treated at their own homes as far as possible. The next step would be to have small hospitals to meet necessary cases, and then of course the large hospitals could be utilised by increasing the area, and having fewer patients in some spaces. Small-pox patients were taken to hospitals in order to prevent a spread of the infection, and this was no doubt desirable. But it was only fair that if they were taken there for the good of the community every precaution should be taken that their mortality should not be increased by aggregation in hospitals.

Mr. W. F. Collier said the paper was especially valuable at Plymouth just now, when they had before them a scheme either for building a new hospital or altering the present one. Sir James Simpson had pointed out the great mortality in hospitals in comparison to the mortality outside, and what they had heard that day was rather a proof that Sir James Simpson was right, although some of the medical profession had challenged his conclusions. Managers of hospitals found great difficulty in doing their duty, owing to the relation of the medical profession with those hospitals and the practice within them.

Mr. Tait, in reply, concurred in the remarks of Dr. Farr as to the unwisdom of putting surgical patients together, and suggested that a mixture of the medical and surgical cases would prevent any of the evils which now arose from the classification of the same kind of cases. In reference to what Mr. Collier had said about the relations of medical men to hospitals, he hoped in the new hospital which it was proposed to build a more accurate method of keeping the statistics would be introduced. He was bound to say the particulars sent up by the South Devon and East Cornwall Hospital lacked accuracy and completeness in the record. He knew that the medical staff of hospitals were often very obstructive, and he believed this arose chiefly from the fact that they were honorary officers, elected for life. He believed that men should be paid honestly for the work they had to do, and then they would do it well. He would not have honorary and life appointments, the holders of which might consider they were conferring a benefit on the public, although they were glad to spend a great deal of money to get the positions. There was no check upon the work which these officers did. He suggested that a small committee of recognised men should elect an officer who should hold office for a period of years not exceeding twenty, and be paid for his work, so that he should be subjected to the same discipline as any one regularly employed. He was the honorary surgeon of a hospital, but he felt that he would be much more comfortable and do his work better if he were regularly employed at a salary.

Typhoid Fever.

In commenting on the recent outbreak of typhoid fever at Marlborough House, the War Offices, and the Admiralty, the *Builder* questions whether medical men are not themselves somewhat to blame for the prevalence of this preventible disease. It is to be expected, says our contemporary, that if called in to a typhoid case, the doctor will make some inquiry; just as, if he were called in to a case of consumption, he would inquire as to the dry or wet condition of the subsoil, and the state of the ventilation. But we mean something more than this. What we wish to become the universal practice is, that when a medical man is consulted on any occasion, at his own house, or on visiting a patient, whatever be the illness, whatever the symptoms, he should make minute and searching inquiry as to the possible escape of sewer-gas, or the contamination of water; and, if he visit the patient, should not only inquire, but see for himself, what the state of things is. If one or two of the most eminent men would set the example it would be universally followed. Those men who failed to take the trouble would by and by be stigmatised as heedless and unreliable practitioners.

It must be admitted that medical men do not as a rule

make very searching inquiries into the origin of the cases of infectious disease which come under their care. They can, however, plead some very good excuses for not doing so. In the first place, if a medical man has a large practice, and several cases of typhoid come under his notice he could not possibly find the time to make such a thorough investigation into their causes as the *Builder* would have him make. And why should he? Our contemporary forgets that there are medical officers of health and inspectors of nuisances who are paid to do this very work, and one reason why the State has provided the country with these sanitary authorities is that public hygiene should be superintended by a class of men whose education and freedom from other pursuits would enable them to give all their attention to, and effectually fulfil, the duties imposed upon them. The principle of division of labour on which the sanitary laws have been framed is, as everyone knows, a good one, and wherefore should it be infringed by the general practitioner taking upon himself a responsiblity which belongs to others? The most he can do, and always should do, is to give as early information as possible of such cases of infectious disease as come under his notice. By this means he would materially assist the sanitary authorities in the performance of their duties, especially as he is the first person to know about any case of outbreak that may happen. Unfortunately, this is not always done, and so far some blame may be attached to that part of the medical profession which is engaged in general practice.

How Small-pox is Spread.

Dr. T. Orme Dudfield's report of the health of Kensington, for the four weeks ending July 21st, 1877, contains some curious revelations on this subject. Out of 43 cases that were recorded in the above period, 11 occurred in one house inhabited by twenty-two persons. The first case was that of a girl, aged ten. The parents of the child concealed the nature of the disease even from the father's brother, who died on the first floor; no preventive measures were taken; it was only by an anonymous letter that the officer of health was made aware of it, and even then the child could not be removed to a hospital, because it was not a case in which the compulsory power of removal could be enforced. Of the twenty-two inmates of the house, eleven were attacked, and four have died. The child above-mentioned was seen running about for days with the scabs of the disease on her face; while the blankets in which she lay were hung over the yard wall, which, strange to say, does not appear to be an offence within the meaning of the 38th section of the Sanitary Act of 1866.

"The most striking fact," says Dr. Dudfield, "in connection with this outbreak is the condition of the household as to vaccination. The man who died had not been vaccinated, nor had either of the dead children—two aged five years, one four years, and one nine months, two of these being the children of the deceased man's brother. The boy, seven years old, who is still dangerously ill, had not been vaccinated; the girl first attacked, aged ten, had not been vaccinated. The other six persons attacked, all of whom had been previously vaccinated, had the disease very lightly indeed. Four who had not been vaccinated, and six who had, have escaped hitherto.

"But it may be asked, How is it that these people, the children especially, had not been vaccinated? The answer is simple. Those of the children that were born since the Compulsory Vaccination Act came into operation, were, with two exceptions, not born in the parish: and their cases had, therefore, never come under the notice of the vaccination officer. Of the two excepted cases, the vaccination had in one of them been repeatedly postponed on account of the child's ill-health—(he is dead now); and in the other case (also dead) the now sorrowing mother confesses that she had changed her residence from place to place repeatedly, to escape the notice of the vaccination officer, having until lately an objection to vaccination, which she no longer entertains. This explanation is necessary to clear an efficient officer from the imputation of neglect of duty that might otherwise be thought to attach to him."

Funeral Reform.

In our issue of July 11th we devoted some attention to the above subject, and we are pleased to find that our words have had some practical effect.

Radical alterations and reforms require time, and though all the curtailment of expense and frippery may not follow, still, there can be no doubt the common sense of the public will induce them to adopt the wise changes suggested. York has made the first step. In a circular or prospectus which has been forwarded to a number of influential inhabitants by the Rev. F. Lawrence, the rector of St. Mary's, Castlegate (hon. sec. *pro tem.*), the aims of the promoters are thus set forth:—"The object shall be to endeavour, by unity, example, and persuasion, to abolish all unnecessary expenditure and show on the occasion of funerals and in the wearing of mourning, and by common consent to substitute a simple, quiet, and unostatious ceremonial. The action of the association is to be in no way denominational, its members adopting the broad ground that funerals should be conducted and mourning worn without the dismal paraphernalia of hatbands, scarves, plumes, heavy crape trimmings, and the like, which are quite inconsistent with a hopeful belief in a future state, involve unprofitable expenditure, inflict severe hardships upon persons of limited means, and neither mitigate grief nor manifest respect for the dead." Here follow quotations from the opinions of Mr. Gladstone, Mr. Bright, Mr. Ruskin, and others, to which is appended a list of suggestions for the effectual carrying out of the objects of the association, and those who desire to become members are invited to communicate with the secretary.

Chloral in Whooping-Cough.

Dr. Milligan, of Wirksworth, writes to the *Practitioner* to say that he has administered this drug in several cases of whooping-cough with success. He gave it in one to five-grain doses three times a day. After four or five doses the spasms and the sickness became less violent in the three affected with it, and at the time of the next visit in five days the specific symptoms had almost disappeared, leaving a slight catarrh. The decided effect of this drug on reflex irritability, and its proved utility in many cases of infantile convulsion and chorea lead, he thinks, to the belief that more extended trials will confirm the high opinion he has formed of it. We have ourselves tried this remedy in a few cases, but have not found it so efficacious as Dr. Millgian appears to have done. From its

soporific action and the depressing influence it has upon the circulation if given is such doses as would curb reflex action we doubt whether it will be found either a safe or reliable medicine in the treatment of whooping-cough. At all events we must be very careful it does not become a popular remedy for this affection, otherwise we shall hear of many accidental deaths occasioned by mothers over-dosing their children with chloral.

The Colorado Beetle Act.

Two orders in Council have been issued during the past fortnight with reference to the introduction of the Colorado beetle into this country. By the first Order, which will come into effect at the end of this month, it will be illegal to land potato haulm, leaves or stalks brought from the United States of America, Canada, or Germany. The destruction of sand, dirt, or other refuse imported with potatoes from any of the places named is to be enforced. The second Order provides for the wholesale destruction of potatoes, or other vegetables, upon which the Colorado beetle in any stage of existence may be found. A penalty not exceeding £10 is attached to a breach of these orders.

In Canada, Paris green is recommended as the chief remedy. Wherever it has been properly used, good results have invariably been obtained. Paris green is an arsenite of copper, and the best qualties contain about 60 per cent. of arsenic, on which its activity depends ; but the inferior grades contain a much smaller per-centage, and are consequently much less effective, and in some cases almost worthless for this purpose. A vigilant watch over the growing crops, combined with hand picking and the use of Paris green is said to ensure success in almost every instance.

Famine Fever.

It appears from an abstract of a report in the last number of *Allen's Indian Mail*, from Dr. Cunningham, who was specially deputed by the Government of India to inquire into the nature of the diseases which have proved so fatal amongst the sufferers from famine in Madras, that he has not been able to discover any peculiar forms of fever during the prevalence of the famine, or, in fact, of any forms of fever which could in any way be ascribed to the influence of want. On the contrary, the Doctor says that in the town of Madras itself "fevers of any kind were practically non-existent, hardly a case being present in any of the hospitals or relief camps, in spite of the high degree of mortality prevalent at that time amongst the inmates of the latter." The prevalence, therefore, of "famine fever" remains still a matter of doubt. But that both diarrhœa and dysentery become more fatal amongst the ill-fed population during a time of scarcity seems to admit of but little question, though further microscopical examinations which Dr. Cunningham proposes to carry out will place the point in a clearer light. He admits, however, that "morbid conditions exist, which may with propriety be termed famine diarrhœa or famine dysentery." As to these diseases themselves, he goes on to say:—"There are without doubt, cases in which the symptoms of disease during life can be referred to no other origin save morbid changes and degeneration dependent on mal-nutrition, Many other cases occurring among the inmates of the relief camps are, however, complicated by the supervention of other diseases, such as acute dysentery, pneumonia, &c., and although in the majority of cases the conditions leading to true 'famine diarrhœa' may be distinctly detected, and in some the complications may be directly ascribed to their agency, yet the fatal termination is caused, or at all events accelerated, by the complications.

The Abuse of Adulteration Law.

We observe that a druggist in Cambridge has been fined £5 for selling soda water which contained no soda, but, in lieu thereof, traces of lead and copper derived from the vessels in which it was made. So far as the first part of the indictment is concerned, the victim has good right to complain that the adulteration hobby is being overridden to his disadvantage, and that the letter of the law is availed of to punish him for a technical offence. "Soda" water is undoubtedly a misnomer, but it can hardly be said to be a deception, for most people know that the beverage so-called contains usually no soda, and that it is not the least the worse of the omission, and they would, probably, buy it as readily under any other name. If analysts aim at disgusting the public with the law, they can do so no more effectually than by prosecuting inoffensive traders for technical offences, and if chemists and druggists want a grievance, this case gives them one.

Trained Nurses for the Sick Poor.

A memorial has been presented from the Metropolitan and National Nursing Association for providing trained nurses for the sick poor to the Lord Chancellor, who has been directed by the Queen to frame rules for the future administration of the Royal Hospital of St. Katherine by the Tower. The memorialists submit that it would be strictly in accordance with the intention of the founders and with the past history of the hospital if a nurses' home for the benefit of the sick poor were established in connection with it in the east of London, and if a portion of its funds were applied to the maintenance of such an institution ; and that in the event of his lordship thinking fit to establish one or more nursing homes in connection with the hospital the said memorialists are prepared to undertake the management and supervision of such homes, under such rules as might be deemed suitable.

Death following the Bite of a Dog.

A peculiar death, said by the coroner's jury to have been from hydrophobia, and certainly, following upon the bite of a dog, is reported in last week's papers. The patient, a boy, having previously enjoyed good health, suddenly became insensible, fell to the ground, and was strongly convulsed. A medical man was called in and found the boy suffering from strong epileptic convulsions. Chloroform arrested the convulsions temporarily ; a hypodermic injection of morphia was then given but without any good effect ; and he died within thirty hours from the onset of the symptoms. The boy had not been liable to epileptic fits previously. It appeared that he had been bitten by a dog some months previously, the

wound had not healed, and his thumb had been kept bound up, but he thought nothing of this as "he had been bitten lots of times, but nothing hurt him." A *post-mortem* examination revealed no coarse lesion, but the membranes of the brain were congested.

Spermatorrhœa and the Electro-Medical Alarm.

We noticed a short time ago this new apparatus, and at the Chirurgical Society of Paris, Aug. 1st, M. Tillaux brought forward another case illustrating its beneficial action.

The patient was a medical student in a deplorable condition from seminal loss, and who had the appearance of an old man. He was preparing for his examination and could not collect his ideas. He then employed M. Minière's invention, and since the 4th July up to 1st August had not a single emission; he increased in weight and using the words of the narrator, "his was a veritable resurrection."

Unfortunately, this alarm can only be used on patients subject to erections!

The London Water Supply.

Many complaints having quite lately reached the Lambeth Vestry of the inferior quality of the water supplied by the Southwark and Vauxhall Company, the Medical Officer of Health (Dr. Fisher Farr) was instructed to make an examination and report to the vestry. He states that it must not be inferred that the water is teeming with "moving organisms," invisible to the naked eye, but that if a quantity of water be set aside and allowed to deposit its suspended matter, and this be collected and placed under the microscope, low forms of animal life are plainly visible, and most of those forms are so minute as to defy the best filter. Their presence is, however, very significant, as being indicative of organic impurities, and by which they are developed and sustained. So long as the water supply is taken from the Thames we shall ever be open, at certain seasons, to inconveniences which no amount of precaution can prevent—viz., by the river floods rendering it turbid and undrinkable, and by the development of these microscopic organisms in the summer time. On the other hand, the Thames water, when pure, is so suitable for all purposes, that if it were possible to rid it of its organic impurity and to ensure its perfect filtration, we should have water even preferable in some respects to that coming from the Kent and Colne Valley. But it must be borne in mind that with a rapidly increasing population there will be a proportionately increased demand, so that the possibility of ever getting purer water from the Thames seems problematical. At certain times the demand is so great that there is not sufficient time to admit of subsidence and filtration before delivery. Large additional reservoirs for subsidence are needed to improve the quality of the water. Little advantage would accrue from seeking a water supply purer than the present, if the plan of storing water in cisterns placed in the most exposed and inaccesible situations were still adhered to. What is really needed is a separate supply for drinking and culinary purposes. While our drinking water is drawn from the same source which supplies our baths, washhouses, and so forth, the wonder is that the water is so pure. An abundant supply from deep natural sources might be obtained for the use of the metropolis if the Metropolitan Board of Works were inclined to undertake the duty of finding a purer source. The water supplied by the Kent and Colne Valley Companies and by the Tottenham Local Board are of most excellent quality; this deep well-water is of unsurpassing purity, and is very abundant in the Thames basin, but it is as yet supplied to but a very small portion of the metropolis.

Infant Mortality in Berlin.

It appears from the statistical reports of the Office de Santé at Berlin, that the mortality among the children of that town is somewhat appalling. Thus, during the month of June more than 700 children died in the capital of Germany from cholera and dysentery. This number has never been reached at any previous period. The Hygienic Society of Berlin has nominated a Commission charged with an investigation into the causes of this extraordinary mortality, and whose attention is to be particularly directed to the conditions of alimentation.

We cordially agree with the suggestion thrown out at a coroner's inquest at Scarborough last week, that a boat should be always stationed in close proximity to bathing stations, especially on the most dangerous parts of the coast. Deaths frequently occur which might easily be prevented by this simple precaution, as was the case with the young lady on whose body the inquest was held. The subject is of such importance that we would like to see it made compulsory upon bathing-machine proprietors to provide this requisite protection, as is the case at most of the French bathing places.

Prince Bismarck is reported, by latest telegrams, to be suffering severely from the effects of overwork and great mental anxiety. Although in absolute need of rest and retirement, he is still strong enough to set Europe anxiously watching for the next wire he may choose to pull; and the Eastern Question, already complicated enough, and bloody in the extreme, may yet, by the solitary action of this one man, resolve itself into a war of nations—in fact, with the present machines of warfare, a war almost of extermination.

We understand that Dr. Alfred Carpenter, M.D., C.S.S., Camb., of Croydon, has a work on "Preventive Medicine in Relation to Public Health" in the Press. The volume will comprise series of papers on Sanitation, Air, Sewage, Water, Hints upon the Management of Sewage Farms, &c.

A hen belonging to Mr. James Barrie, sen., Blairs, Fetteresso, has brought out a chicken of the Dorking breed, which had one head, two neck-bones united, one body, four wings, two tails, and four legs and feet. The chicken did not live, but it has been preserved in spirit.

We understand that Professor Erasmus Wilson, F.R.S., at whose expense Cleopatra's Needle is being conveyed

to this country, is preparing a popular work on the subject of obelisks, which will serve as an introduction and explanation of the coming monolith.

Sir Alexander Armstrong, the Director-General of the Naval Medical Department, has commenced his annual official inspection of the various naval establishments.

Two fatal cases of fever are reported on board the British fleet at Besika Bay.

SANITARY INSTITUTE OF GREAT BRITAIN.

It has been finally decided to hold the first annual congress of this Institute at Leamington, on October 3rd and three following days. Dr. B. W. Richardson has been unanimously elected president.

The objects of the Institute are:—To obtain a complete registration of sickness, and especially of all cases of preventible disease. To secure the services of medical and other scientific lecturers on subjects relating to the preservation of health. To establish communications with medical officers of health, and to render every available assistance to them and to the public, by forming local branches of the Institute throughout the kingdom. To examine and grant certificates of qualification to local surveyors and inspectors of nuisances, and to form a register of such "certified officers." To investigate the chemical aspect of any processes for the disposal, deodorisation, or utilisation of sewage, or of the refuse from factories, chemical works, and noxious trades. To establish, in a central locality in London, an exhibition of sanitary apparatus and appliances, and to publish a catalogue explanatory of the same, which shall serve as a record of all sanitary inventions of permanent value, thereby affording to medical officers of health, local surveyors, inspectors of nuisances, and the public generally an amount of practical information which could not be obtained by any other means of study. To examine and discuss any measures relating to public health which may be presented to Parliament, &c.

The following are among the principal papers to be read at the Congress:—Surgeon-Major F. S. B. de Chaumont, M.D., on "The Effects of Climate upon Health." Mr. Joseph Baly, F.R.C.S., Medical Officer of Health, Leamington, on "The Sanitary Condition of Leamington." Miss Rose Adams, of the Ladies' Sanitary Association, on "Woman's Work in relation to Sanitary Science." The Venerable Archdeacon Denison on "The Supply and Storage of Water at East Brent." Mr. T. J. Dyke, F.R.C.S., on "Missing Links in the Sanitary Administrative Service." Mr. W. Eassie, C.E., F.L.S., on "Influence of Vegetation upon Human Health." Mr. H. Burdett, on "The Dwellings of the Poor in Large Towns." Dr. Edwyn Slade-King, on "Sanitary Work in English Watering Places and Summer Resorts." James Stevenson, M.D., on "Public Conveyances for the Infected Sick in London, suggesting an Uniform System for the Country at Large." H. C. Bartlett, Ph.D., F.C.S., on "Water for Domestic Use." James Russell, M.B., on "The Necessity of Plumbers and Builders possessing a compntent knowledge of the Laws of Health as bearing on their respective occupations." Mr. A. Haviland, on "Geography of Disease in relation to Sanitary Science." The following gentlemen will also take part in the proceedings of the Congress:—Dr. George Wilson, Medical Officer of Health for Mid-Warwickshire, Mr. Brudenell Carter, F.R.C.S.; Mr. Baldwin Latham, C.E.; Mr. Earnest Turner, F.R.I.B.A.; Dr. J. Sinclair Holden; Mr. C. F. Gardner; and Dr. T. Moffat.

Correspondence.

PATENT BAGS AND CASES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—You justly observe we have a superfluity of such patents as bags, &c., they are simply *auto*-advertisements, and though men, of whom we might expect better things have given their names to them, as Dr. A.'s, bag, Dr. B.'s bag, Dr. C.'s bag, it is a practice to be condemned. There was some merit in Laennec's stethoscope, in Civiale's and John Weiss's Lithotrites, and in numerous other instruments I might name; but there is none in devising a bag to hold them.

It is amusing at the present time to follow the correspondence on one of those patents. I am not going to *advertise* the men's names. Dr. X. makes a case to hold a few simple tests, Dr. Y. claims priority, as the cases are exactly alike: General correspondence on the subject.

A distinguished medical swell improves on Dr. X.'s, which of course he praises; more correspondence, mutual admiration of each other's ingenuity, and thus Dr. X., whose name, in the natural course of professional work, would never have been known beyond the narrow limit of his own *clientele*, obtains a world-wide notoriety as a patentee and inventor.

Shade of Neil Arnott! who never patented any of his inventions, even his hydrostatic bed, can you not again revisit the sphere of your earthly labours and teach such men professional pride and humility?

The *Spectator* (Addison's) has a capital article on the use of the "Fan;" if the writer of it was now alive, he might take as his theme, "The Bag as a Means of Securing Practice." In many towns it has become the fashion to go about with one holding all the armamentaria, and thus if you have to vaccinate, cut a corn, open a boil, or perform any other such serious operation, you are provided with your tourniquets, artery forceps, &c. It impresses the public, and gives rise to such comments as the following:—

Scene. *Market Day. Market thronged. Dr. W.'s carriage comes on at full speed, suddenly stops. Dr. W. jumps out with a* BLACK BAG *in his hand and rushes into a house.*

Stranger (*loq.*): Who's that?

Citizen: Dr. W., clever rising man, enormous practice, great operator.

Stranger: What's in the bag?

Citizen: His instruments, some of silver, some of gold, all his own invention.

Stranger (*sententiously*): If he has so much in his bag, what must he have in his head?

Tableau.

The last conclusion may be rather a fallacious one, for probably if Dr. W.'s head was opened, there might be found, as in the bag—some stuff, but very little brains.

Yours, &c.,

Juvenis Medicus.

August 20th, 1877.

THE (SO-CALLED) HOMŒOPATHIC SCHISM.

"T'were an odd world, were the captains of a sailng-ship and steamer to mutually hate one another as schismatic and sectarian."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Pardon my intruding very briefly on your courtesy in relation to a remark of Dr. Wyld's in your issue of August 22nd.

I neither claim to represent "sectarian homœopathy," as he asserts, nor do I allow that he alone represents "broad and progressive homœopathy."

My desire in the short letter which I contributed to this discussion in the pages of a contemporary, was to point out that Dr. Wyld's letter was only the expression of his personal willingness to sacrifice the *word homœopathy* as a concession, which he fondly hoped would cause the whole profession to open its arms to himself and to its prodigal (homœopathic) sons.

I take a broader view of the differences which exist between those physicians who have adopted homœopathy into their practice, and those who have not studied the subject, and have rejected it and its professors.

I deny that the adoption of any new theory or practice of medicine constitutes a practitioner, "schismatic," or "sectarian." Medicine is a progressive science; it is not limited by a creed, and therefore has neither orthodoxy, or heterodoxy, neither sectarianism, nor schism.

Believing as I do, that the exclusion of the theory and practice of homœopathy from the teachings of the ordinary schools is injurious to scientific progress in medicine, and restricts our power to alleviate suffering, I have assisted in forming a *School of Homœopathy*, where materia medica, and therapeutics, and also practice of medicine, shall be taught, including the homœopathic method.

The establishment of this "School of Homœopathy," is not intended as a rival to any existing schools. Its courses of lectures are not intended to take the place of any recognised courses of lectures on the same subjects. The lectures are *extra-academical*, and have always been so declared in all the prospectuses and papers relating to the school. Neither are they *sectarian*, in any way or sense. They have always been spoken of as supplementary; intended to supply the homœopathic teaching to such medical men and students as desire to add a knowledge of homœopathy to their other professional acquirements. Had my views been sectarian, or schismatic, I should have endeavoured to obtain "recognition" for our lectures, and have advised students to attend our lectures, *in place* of the ordinary lectures on materia medica, therapeutics, and practice of medicine; whereas I say, in our first prospectus, "the ordinary medical schools of Great Britain supply all the teaching necessary for the education of a physician or surgeon, with this one important exception, viz., the teaching of the homœopathic materia medica and therapeutics. It is to supply this want, and *not to inaugurate any rival effort*, that it is proposed to establish a school of homœopathy."

My effort is *not sectarian*, but essentially *catholic*. I wish to see homœopathy taught as electricity, hydropathy, and every other branch of therapeutics is taught, *within the great school of medicine*, and as soon as it takes its proper place side by side with other special therapeutics, I shall be quite willing to incorporate our school with such general school as is willing to receive it. The use of homœopathy in medicine no more makes a man's practice *sectarian*, than does the use of steam as a propelling power in navigation make its user a sectarian.

The use of steam as a propelling power gives the ship to which it is applied the name of a steamer, and nobody is offended even if the captain sometimes uses sails, as Mr. Brassey did lately in his steam yacht *Undine*, for 3,000 miles or more. In the same way the practice of a physician, using "homœopathy" is designated "homœopathic," to distinguish it from the practice of another who prefers the older method to the exclusion of homœopathy.

I see no reason why we should be at feud on these points. It is as open to me to use homœopathy as it is to my neighbour to refuse to do so. The captain of a steamer has no right to abuse or look down upon the captain of a sailing ship, nor do I see that either ought to expect the other to feel bound to give him advice whenever he may need it.

Any physician has, I assume, the right to meet me, or to refuse to meet me in consultation, and I bear them no grudge. There are many men whom I should refuse to consult with, and I both claim and avoid liberty of action in this and all other matters.

Medical progress demands *liberty* in all things, but I do not see that this essentially forces *equality* and *fraternity* as conferred on all men who possess similar diplomas.

Yours, &c.,

WILLIAM BAYES, M.D.

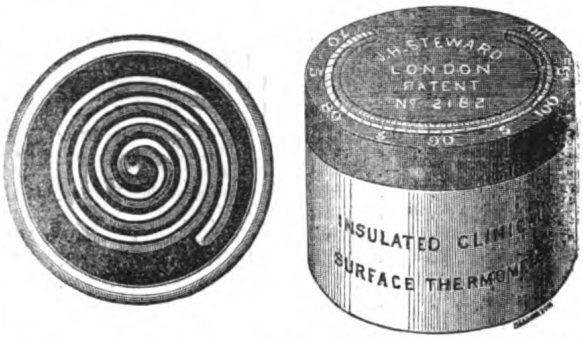
4 Granville Place, Portman Square, W.

P.S.—Dr. Wyld appears to claim a vote, by which the British Homœopathic Society declined to take any notice of his letter to Dr. Richardson, as having sanctioned his letter and its purposes. In this he is mistaken; the *majority* did not deem his letter of sufficient importance to demand any public notice on the part of the society, while so strongly did the members disapprove of Dr. Wyld's unauthorised action, that it did not (as is usual) re-elect him as its Vice-President. This was equivalent to a vote of censure.

New Inventions.

AN INSULATED CLINICAL SURFACE THERMOMETER.

THIS little instrument, introduced by Dr. Mortimer Granville to record the temperature of the surface of the body, consists of a German silver cup fitted into an ivory case, which encloses a coiled tube containing the column of mercury; from the centre the tube is carried through an aperture, protected from contact with the external atmosphere by an india-rubber band, to the outside of the cup, where it is curved and covered by an ebonite case forming the scale marked from 70 to 110 degrees Fahr. divided into fourths.



The thermometer is applied to the surface to be tested like a cupping glass, the coil of mercury resting on the skin, the temperature of the enclosed air is speedily raised to that of the surface on which it rests and recorded on the outside.

An instrument for this purpose was designed by Dr. Dupré some years since, but not brought into general use, and we are assured it was quite unknown to the inventor of the Insulated Clinical Surface Thermometer, and to the patentee, Mr. J. H. Steward, of 406 Strand, by whom this instrument is manufactured.

Indian Medical Service.—List of candidates for Her Majesty's Indian Medical Service who were successful at the competitive examination held at Burlington House on the 13th August, 1877. Twenty-eight candidates competed for 19 appointments, 26 were reported qualified, and 2 retired from the examination :—

Thom, A.	2795	Bennett, C. H.	1922
Thomson, S. J.	2268	Davidson, D. C.	1910
Brander, E. S.	2267	Jervis, H. P.	1845
Manser, R.	2160	Peacocke, H. C. H.	1830
Campbell, R. N.	2036	Koyaji, B. N.	1820
Emerson, G. A.	2033	Thornhill, W. H.	1795
Adey, H.	2030	Sargent, A. F.	1775
Chatterjee, F. C.	2020	Reporter, M. E.	1725
Tully, E.	1980	Robinson, R. H.	1710
Street, A. W. F.	1960		

The following candidates for Her Majesty's Indian Medical Service were successful at the competitive examination at London in February last, and have undergone a course of instruction at the Army Medical School, together with the total number of marks obtained at the examinations at London and Netley :—

Rogers, T. K. (*a*)	5613	Eleum, D.	4443
Hatch, W. K.	5382	Mullen, D.	4399
Owen, W.	5380	Taaffe, R. J.	4337
Masani, H. D.	5280	Robinson, E. L.	4336
Gillies, W.	5060	Nelis, I. A.	4315
Jack, D. M.	5050	Bouton, G. C.	4096
Coury, W.	4991	Smyth, W. B.	4033
Nailer, H. A. F.	4915	Chatterjee, N.	3945
Kirtikar, K. R.	4830	Crofts, A. M.	3939
Kellie, G. S.	4760	Crofts, J.	3895
Hancock, G. I.	4673	Coutes, W.	3894
Basu, D.	4635	Blood, I.	3892
Mackenzie, A. W.	4680	Dutt, R. L.	3767
Mullane, I,	4471		

(*a*) Gained the Martin Memorial Medal.

NOTICES TO CORRESPONDENTS.

Dr. H., Leeds.—We shall be glad of further particulars. We have to be careful, that is one of the evils of the provident dispensary system. If two men have the same name and live in the same square it must be very annoying to the more eminent of the two. No man of honour or proper professional feeling would palm himself off as the real Simon pure; but, as you say, "we have unfortunately men in our profession who descend to the lowest depths of degradation to secure patients." If the names of the patrons are on the advertisement without their sanction why do they not take steps to remove them!

Neuralgia.—Gubler has recently recommended aconitia in facial neuralgia. The extract was used in 1834 by M. Rocho and M. Tealier.

Ovariotomy.—You will find the retrospective address of John Green Cross in "Provincial Transactions," 1837. It was delivered at the fourth meeting Provincial Med. and Surg. Association, Manchester, July 21, 1836.

Chemist.—It is quite true; Fowler's claim to the preparation which bears his name has been disputed. A prescription somewhat similar to his occurs in the "Medical Museums," printed in 1758.

University, Salford.—Owens College was founded by a bequest of John Owens of £100,000. A new constitution was obtained in 1870. The first stone of the new building was laid 23rd Sept., 1870, by the Duke of Devonshire.

Dr. Compton, Indiana.—We regret that we have not space to insert the letter. In no country are the people sufficiently intelligent to discountenance altogether pretenders to a knowledge of medicine.

A Reader.—1. Dialised Iron. 2. The preparations of Messrs. Squire and the "Fer Bravais" are the most reliable at present in the market.

VACANCIES.

Dental Hospital of London.—Medical Tutor in the Dental School, and Demonstrator of Dental Operations in the Hospital. Salary, £100 attached to each office. (See Advt.)

Birmingham and Midland Free Hospital for Sick Children.—Resident Medical Officer. Salary, £80 per annum, with apartments, board, washing, and attendance. Applications on or before Sept. 7.

Bedford General Infirmary.—Resident Surgeon. Salary, £100 per annum, with board and lodging. Applications on or before Sept. 27.

Carlisle Dispensary.—Junior House Surgeon. Salary, £90 per annum, with apartments, coals, gas, and attendance.

Chorlton Union.—Assistant to the Workhouse Medical Officer. Salary, £120 per annum, with residence and attendance. Applications on or before Sept. 4.

Hospital for Sick Children, Great Ormond Street.—Junior House Surgeon. Salary, £50 per annum, with board and residence. Applications on or before Sept. 5.

Liverpool Dispensaries.—Two Assistant House Surgeons. Salary, £108 per annum, with furnished apartments, coals, gas, and attendance. Applications on or before Sept. 1.

North Eastern Hospital for Children, Hackney Road.—Physician. Applications on or before Sept. 11.

St. Mary's Hospital Medical School.—Pathologist and Medical Tutor. Salary, £100 per annum. Applications on or before Sept. 24.

Killala Union Workhouse.—Medical Officer. Salary, £50. Election, Sept. 1.

Killala Union, Killala Dispensary.—Medical Officer. Salary, £80. Election, Sept. 1.

Newry Union Workhouse.—Medical Officer. Salary, £100. Election, Sept. 1.

APPOINTMENTS.

Brown, G. A., M.R.C.S.E., Medical Officer of Health for the Tredegar Urban Sanitary District.

Mayburv, W. A., M.D., M.R.C.S.E., Medical Referee for the Colchester District of the Essex Provident Society.

Murphy, James, A.B., M.B. Dub., Lecturer on Botany at the University of Durham School of Medicine.

Thompson, J. E., A.B., B.Ch., Resident Assistant and Registrar to the Country Infirmary, Roscommon.

Births.

Higginson.—Aug. 21, at Bridge House, Bangor, co. Down, the wife of H. Talbot Higginson, M.D., L.R.C.S.I., of a son.

Iliffe.—Aug. 16, at Kendal, the wife of Walter Iliffe, F.R.C.S.Ed., of a son.

MacGrath.—Aug. 20, at Colville Terrace East, Bayswater, the wife of W. M. MacGrath, F.R.C.S.I., &c., of a son.

Miller.—Aug. 17, at Blackheath, the wife of J. N. Miller, M.D., of a son.

Stokoe.—Aug. 19, at Beddington, Surrey, the wife of P. H. Stokoe, M.D., of a son.

Swanzy.—Aug. 19, at 16 Upper Mount Street, Dublin, the wife of H. R. Swanzy, F.R.C.S.I., of a son.

Marriages.

Charles—Casey.—Aug. 21, at Drumcondra, co. Dublin, Daniel Allen Charles, M.D., Bellaghy, co. Derry, to Anna, daughter of the late Andrew Casey, of Slane.

Palmer—Barrington.—Aug. 22, at Limerick, John Richard Palmer, M.D., of Durrow, Queen's County, to Caroline, daughter of the late John Barrington, Solicitor, Limerick.

Deaths.

Andrews.—On Aug. 14, at Landport, John Andrews, Surgeon, aged 75.

Boot.—On Aug. 18, at Sleaford, John Hopkinson Boot, M.D., aged 68.

Morison.—On Aug. 17, at Kirkcaldy, J. Wemyss Morison, L.R.C.P.Ed.

Nason.—On Aug. 13, at his residence, Ashford, Kent, Charles Arthur Nason, M.R.C.S.E., aged 35.

Phillips.—On July 26, William Weld Phillips, M.R.C.S.E., of Farnsfield, Notts, aged 67.

Shaw.—On Aug. 15, at Elstree, Herts, Edward Charles James Shaw M.R.C.S.E., aged 69.

THE HARVEIAN ORATION—1877.

DELIVERED BEFORE

THE ROYAL COLLEGE OF PHYSICIANS.

By Edward H. Sieveking, M.D., F.R.C.P.,

Physician-Extraordinary to the Queen; Physician-in Ordinary to the Prince of Wales; Physician to St. Mary's and the Lock Hospitals, &c.

Veritatis invicta vis est. Adrasteæ legem nemo potest facile effugere, si credendum veteribus et Galeno nostro, qui ipse suo exemplo hoc demonstravit, sicut vero in multis aliis hoc patuit, ita nescio an unquam clarius quam in novâ doctrinâ de motu sanguinis.—Pauli Marquarti Stegelii "De Motu Sanguinis Commentatio." Hamburgi; 1650.

Mr. President and Fellows of the Royal College of Physicians: Gentlemen,—The fog that prevailed in the realms of science before the publication of Harvey's great work, compared to the ever-brightening light that has been shed over them since he taught the doctrine that has been all but universally associated with his name since 1628, necessarily renders us, as it did his contemporaries of this ancient College, anxious to see that his fame suffers no diminution through our neglect.

It might seem impossible for any one who has carefully studied the literature of the subject, to entertain a doubt as to Harvey's claim to be regarded as the regenerator of human and animal physiology. The feeble opposition of the ungenerous Riolan (*a*) who taught a modified Galenic doctrine of the functions of the heart and vessels, was triumphantly met by the clear and practical exposition of Professor Schlegel of Hamburg. Other men, no less distinguished in their age and country, appeared to establish Harvey as the real founder of the doctrine of the circulation, to which we ascribe the origin of modern scientific medicine. Professor Walæus (*a*) in Leyden in 1640, Joannes Trullius (*b*) in Rome in 1651, supported the new doctrine. Plempius in Louvain, in 1652, voluntarily and publicly professed himself an adherent of Harvey. Previous to the appearance of Schlegel's admirable work in 1650, his friend and compatriot Werner Rolfink (*c*) reputed one of the best German anatomists of the time, had in 1630 given his adhesion to Harvey's views. Nor is it without significance that Descartes (*d*) in his "Discours de la Méthode pour bien conduire sa Raison et chercher la Vérité dans les Sciences," in 1637, spoke of the English physician as the man to whom the world owed the knowledge of a continuous circulation of the blood. Although here and there writers, jealous of Harvey's fame, brought forward Servetus, Sarpas, Cæsalpinus, and others still less worthy of being named, as possessing prior claims to the position assigned to Harvey, the great body of scientific men of that and all future days have subscribed to the opinion that we owe the modern doctrine of the circulation of the blood and of the moving power of the heart to him.

After the many disquisitions on the priority of Harvey's claims that have been offered to the Fellows of this College, from the oration of Friend to that of the exhaustive address by the learned Linacre Professor Dr. Rolleston, four years ago, it would scarcely have been befitting in me to bring up this *crambe iterum repetita* on the present occasion, had not a recent event appeared to

(*a*) "Les mauvais raisonnements de Riolan."—Flourens, "Histoire de la Circulation," p. 37.

(*a*) Born in 1604, at Kondekerke, in Zeeland, died in 1649.

(*b*) See "Versuch einer pragmatischen Geschichte der Arzneikunde," von Kurt Sprengel. Halle, 1800-1803, 5 vols. 8vo, vol. iv, p. 43. This book may be generally consulted with advantage on all questions connected with the history of medicine from the earliest times to the end of the eighteenth century.

(*c*) Werner Rolfink was born at Hamburg, in 1599, and, like Schlegel, filled the post of Professor of Medicine, Botany, Anatomy, and Chemistry, at Jena. His chief work was entitled "Dissert Anat.," lib vi (see lib. v, c. 12, p. 845, and lib. vi c. 14, p. 1089). He died in 1677.

(*d*) "Discours de la Methode par Descartes, avec un notice biographique," par Ad. Hatzfeldt. Paris, 1872, p. 71, *et seq.*

make it a matter of duty to inquire again into the claims of one of the three names just mentioned.

English physicians were startled last year (*a*) by the announcement that on October 30th a monument of Andrea Cesalpino was unveiled at Rome, on the ground of his being the first discover of the circulation of the blood. Dr. Giulio Ceradini, Professor of Physiology at Genoa, appears to have been the chief orator on the occasion, and to have asserted, after stating that Cesalpino produced experimental proof of the circulation in 1593, that Harvey could in 1628 adduce nothing more than a fresh proof of the circulation in the venous valves, discovered by Fabricius at Aquapendente as early as 1574, by demonstrating that the said valves must oppose the centrifugal movement of the blood in the veins. Ceradini maintained that Harvey's merit really consists in having sustained and won a battle against ignorance and prejudice by divulging the discovery of Cesalpino.

Although the claims of Andrea Cesalpino of Arezzo have been put forward and amply discussed—by none perhaps, more fully and justly than by Dr. Willis in his admirable "Life of Harvey" (*b*)—it has appeared to be, under the circumstances, a duty of the Harveian orator of the present year to search the original works of Cesalpino, and to ascertain whether contemporary and later history have erred in awarding to our countryman the palm which really belongs to a greater predecessor of his. One thing appears indisputable; that, whatever Cesalpino has written, his views on the circulation were not considered of much consequence, and certainly not subversive of the old Galenic doctrines, at the time that Harvey resided in Padua, and subsequently Schlegel in Venice and other parts of Italy. The former, whom his greatest detractors (*c*) have never accused of want of uprightness and honesty, does not allude to the discoveries of Cesalpino; and the latter (*d*) distinctly says that, having been in familiar intercourse with the most distinguished anatomists of Padua, Venice, and throughout Italy, for some years, he had found "the movement of the blood almost entirely unknown, or that it certainly was regarded as incredible."(*e*) Schlegel manifestly speaks of the movement of the blood as taught by Harvey, because earlier writers had discussed the question of the circulation, as Harvey himself admits,(*f*) but, "like persons purblind or groping about in the dark," had failed to recognise the intimate connection and beautiful harmony of the different parts involved in the process.

The entire tenour of Harvey's life and work forbids the view that he was a plagiarist, and that, as Cesalpino's panegyrist has recently asserted, he arrogated to himself a discovery which belongs to the latter. Contemporary writers failed to recognise in Harvey's doctrine a reproduction of the teachings of Cesalpino; and, though his great adversary, Riolan, was satisfied that Harvey had been anticipated by Aristotle and Cesalpino, we can scarcely doubt that Schlegel correctly describes the state of medical science and the effect produced by the great work published in 1628. He says of Harveys doctrine: (*a*) "*Inaudita, communibusque et per multa sæcula inveteratis opinionibus adversissima sententia, omnes commovit.*"

But let us do justice to Cesalpino; for, though it is clear to my mind that he failed to appreciate the truth as it was made plain by Harvey, he approached nearer to him than any of the physiologists of earlier days. Any one who was satisfied with the evidence afforded by solitary passages in his writings might fairly assert that Cesalpino had taught the true doctrine of the circulation; but, when we search further, and find that he still regards the flow of the blood comparable to the flood and ebb tides of the Euripus; that the arteries, according to him, convey the spirit to which their pulse is due; and that he utterly failed to recognise in the heart the central moving power of the circulation,—we cannot but arrive at the conclusion that his doctrine, by itself, would never have formed the basis of modern physiology.

Cesalpino, whose work was published at Venice in 1593, (*b*) in the fifth book of his Peripatetic Questions (*c*) describes the circulation in the following words: "As rivulets draw water from a spring, the veins and arteries take their origin from the heart. It is further necessary that they should all be continuous with the heart, that the blood contained in them may be preserved by its heat, for it congeals under the influence of cold, as appears whenever it is removed from the veins. Dissection shows that all veins are continuous with the heart alone, for those which pass from the heart to the lungs are continuous with no other viscus; they terminate in the ventricles of the heart and pass no further. The vena cava and the aorta, having reached the other viscera with the exception of the heart, pass beyond them; or, if they come to an end, they do not pour their blood into a general receptacle (*non in ventrum aliquem transfudunt sanguinem*), but are broken up into hair tubes (*capilla menta*), for nowhere excepting in the heart is the blood contained in a receptacle out of the veins."

Although in this passage Cesalpino speaks of a continuity of the blood-vessels, he still adheres, as shown in another passages (*d*) to the view that the venous system depends less upon the heart than upon the liver, which organ possesses a special nutritive power (*vim altricem*), and is the real source of the veins: "*non igitur cor sed epar est principium venarum.*" Again, elsewhere (*e*) Cæsalpinus gives his adhesion to the ancient fallacy that the blood passes not only to the lungs from the right ventricle, but also through the septum into the left side of the heart; "*partim per medium septum, partim per medios pulmones (sanguis) refrigerationis gratia ex dextro in sinistrum transmittitur.*"

Even Harvey himself, conclusive as are his proofs of a continuity of the current both in the lesser and greater circulation from the heart as a starting-point back again to the central organ, nowhere gets beyond the prevailing view of an anastomosis between the arteries and the veins. It would be as reasonable to infer that Cesalpino had, without a microscope, anticipated the great discovery of capillaries by Malpighi because he accidentally uses the term "capillamenta" to designate the minute divisions of

(*a*) *Lancet*, November 4th, 1876.

(*b*) Prefixed to the Sydenham Society's edition of the "Works of William Harvey," 1847, p. 60.

(*c*) Among these we are pained to mention William Hunter, who, in his two introductory lectures to his last course of "Anatomical Lectures," 1784, pp. 43, *et. seq.*, speaks of Harvey in a manner that is a blot upon the lecturer's name, and shows that he had not investigated the question by a reference to the original works of the men whom he compares with Harvey.

(*d*) Pauli Marquarti Slegelii, M.D., Hamburg, "De Sanguinius Motu Commentatio," Hamburgi, 1650, p. 7. Schlegel (Latinised, Slegelius), the son of a merchant, was born at Hamburg in 1605, and studied medicine at Altorf, Wittenburg, and Jena. In 1631, in company with Rolfink, he undertook a long scientific tour. He visited Holland and England, then went to Paris, where he remained two years; subsequently spent several years in Italy; and, after taking a degree at Padua in 1636, returned to Germany in 1638. He was at once appointed Professor of Anatomy, Surgery, and Botany at Jena. In 1642, Schlegel was invited to accept the office of subphysicus, or assistant officer of health, in Hamburg, where he founded an anatomical theatre. He died in 1653. For further details, see "Mittheilungen aus der alteren Medicinal Geschichte Hamburg's" von Physicus Dr. Gernet, Hamburg, 1859; and also "Lexicon der Hamburgischen Schriftsteller bis zur Gegenwart," von Dr. H. Schroeder, now publishing. In the last, a list of twenty-four works by Schlegel is given, which illustrates both the variety and the depth of his studies.

(*e*) The original Latin is: Quin imo doctrinam illo tempore de motu sanguinis apud omnes fere incompertam aut certe pro incredibile habitam fuisse, neque obtineri potuisse rationibus ab iis ut assentirentur.

the vena cava and the aorta, as it is to regard him as the true discoverer of the circulation of the blood. Everybody, as Cesalpino says, knew in his day that the arteries took their origin from the heart in order that they might distribute the vital spirit throughout the body; and, again, he maintains that a continuous movement is propagated throughout the different parts of the body, because there is a continuous generation of spirit, which, by its increase (*amplificatione*), is fitted very rapidly to be diffused everywhere.

Cesalpino argues that the heart is manifestly the chief organ of sensation (*primum sensorium*), because it is associated with every sense of joy or sadness, which are first perceived to exist in the heart. The heart, therefore, is the origin of the nerves. And what, he asks, could such a struggle about the heart effect, unless there were a continuous passage from the heart to the instruments of movement, by which a large amount of spirit (*spiritus multus*) could be conveyed? There is not much in the foregoing passage that we can utilise; but in the following there is a mixture of truth and error which is more suggestive, although it will not bear comparison with the clear and practical deductions, based upon observation in the dead and living body, which Harvey has laid before us in language as free from hypothetical jargon as anything known in science. In discussing the question of suffocation, Cesalpino (*a*) says: "It appears worthy of inquiry why veins swell on the distal side of a ligature and not on the opposite side, which those know from experience who open a wide vein, for they apply the ligature above the point of section, and not below, because the veins swell below and not above the ligature. But the opposite result ought to happen if the movement of the blood and spirit passed from the bowels to the body at large; for, if the passage be intercepted, no further progress is possible: therefore the swelling of the veins ought to have been above the ligature."

After inquiry into Aristotle's view on the subject, Cesalpino goes on to say: "The passages of the heart, have been so prepared by Nature that the vena cava opens into the right ventricle of the heart, from which a passage opens into the lung; from the lung there is another passage into the left ventricle of the heart; from which, finally, an outlet opens into the aorta, certain membranes being placed at the mouths of the vessels to prevent a return; for there is a certain continuous movement from the vena cava through the heart and lungs into the aorta. But as, during wakefulness, the movement of native heat takes place outwards, namely, to the sensorial parts; but during sleep, inwards, namely, to the heart—it appears that during wakefulness much spirit and blood are carried to the arteries, for there is a passage from them to the nerves. But in sleep the same heat returns through the veins to the heart, and not through the arteries; for the natural entrance is through the vena cava into the heart, and not through the arteries. The proof of this is to be found in the pulses, which are large, powerful, quick, and frequent in those waking up, occurring with a certain vibration; during sleep, they are small, languid, slow, and scanty. For during sleep the native heat tends less into the arteries, but rushes more violently into them as the individual wakes up. The veins behave in a different manner, for during sleep they tumefy, but shrink in the waking state, as any one may see who looks at the veins of the hand. For during sleep the natural heat passes from the arteries to the veins by inosculations, which are called anastomoses, and thence to the heart; but, as the tidal movement of the blood (*exundatio*) to the upper parts, and its ebb (*retrocessus*) to the lower parts, like Euripus, is manifest in sleeping and waking, so this kind of movement is not obscure wherever a ligature is applied to a part of the body, or the veins are closed in some other way.

I trust I shall be pardoned if I do not go more fully into this question of priority, but refer those in whose minds any doubt may remain, to the original works of Cesalpino, where they will find much to interest them. Even the brief quotations that I have laid before you appear to justify to a certain extent the claims that have been raised for higher distinction among the physiologists of the past for Cesalpino than may have hitherto been awarded him, but at the same time I venture to think that they are conclusive as to the view that Cesalpino cannot be declared worthy to occupy the place so long and universally assigned to our illustrious countryman. Certainly, Cesalpino himself was not conscious of having made an important, if any, discovery; for he introduces the subject of the circulation incidentally in a chapter headed, *Cor non solum atreriarum sed et venarum et nervorum principium*, and nowhere lays stress upon what is now claimed as his prerogative. Even among the list of subjects contained in his "Index eorum quæ notatu digna viva sunt," the circulation is not inserted. Lest, as Englishmen, we may be tempted to take a one-sided view of the question, permit me to adduce a few words from the work of one of the most eminent modern French physiologists, Flourens (*a*) who in his "Histoire de la Circulation du Sang," gives evidence of a minute study of the authors who preceded Harvey, says: "Lorsque Harvey parut, tout, relativement á la circulation, avait été indiqué ou soupçonné, rien n'était établi. Rien n'était établi, et cela est si vrai que Fabrice d'Acquapendente, qui vient après Césalpin et qui découvre les valvules des veines, ne connait pas la circulation." And it may be added that he quite misinterpreted the functions of the valves.

A careful study of the entire subject appears fully to justify the opinion expressed by Dr. Willis (*b*) that Cesalpino, tried by a moderately searching criticism, presents himself to us as but very little further advanced than the ancients in his ideas on the motion of the blood; and again, that "the world saw nothing of the circulation of the blood in Servetus, Columbus, Cæsalpinus, or Shakespeare, until after William Harvey had taught and written."

We all know that Harvey did not evolve his doctrine out of his inner consciousness, but that by intense application and the study of vital phenomena he arrived at the conclusions set forth in 1628, having undertaken a task which at the outset he regarded "as so full of difficulties that he was almost tempted to think with Fracastorius that the motion of the heart was only to be comprehended by God." It will be interesting to the Fellows of this College, no less than to the world of science at large, to know that we now have it in our power to estimate more accurately the gradual advances by which Harvey eventually arrived at his goal, inasmuch as the original notes of the first lectures which he delivered in this College in 1616 and in subsequent years, as Lumleian Lecturer on Anatomy and Physiology, have been recently rediscovered in the British Museum. Harvey tells us in the introductory letter to his "very dear friend Dr. Argent, the excellent and accomplished President of the College of Physicians, prefixed to his work "De Motu Sanguinis," published in 1628, that he had "for nine years and more confirmed his views by multiplied demonstrations.' Hence the first date of the new doctrine is ordinarily fixed in 1619; but the manuscript lectures show that Harvey delivered his first lectures in 1616, and was then already on the threshold of the complete discovery. These lectures formed a part of the library of Sir Hans Sloane, which was purchased by Government in 1754, and, though entered in the catalogue of the Museum, they have disappeared for above a hundred years. A few

(*a*) *Loc. cit.*, p. 243.

(*a*) "Histoire de la Circulation du Sang," par. P. Flourens, Professeur au Muséum d'Histoire Naturelle de Paris, 1854, p. 28, An excellent summary of the history of the circulation is given in Mr. Lewes's "Physiology of Common Life" (vol. i, p. 259, 1859), in which the claims of Harvey and of his predecessors are fairly and succinctly set forth.

(*b*) "The Life of Harvey." Introduction to Sydenham Society's edition of Harvey's works, p. 63.

months ago, in going over the duplicate books which had been set aside, this manuscript was found, probably in all the better preservation from having been so long buried. Allusion is made to these lectures by several writers. Dr. Rolleston, in his Harveian Oration (p. 70), gives all the details that he was able to collect regarding them, and recounts with what diligence they had been searched for. They were also evidently seen by the writer of Harvey's life prefixed to the edition of his works published by the College of Physicians in 1766, but have been mislaid since then. The notes are written in Latin, but the abbreviations and the handwriting are so quaint that no one but a gentleman in the habit of studying manuscripts of the period can decipher them. (*a*) Mr. Bond, the Chief of the Manuscript Department of the British Museum, has kindly produced a readable transcript of that portion of the lectures which commands our special attention. Possibly this College may consider it a duty that it owes to itself no less than to the memory of the illustrious author to publish these notes, entire or in part, so as to complete as far as possible the history of the subject to which our attention is specially directed. Coupled with Schlegel's admirable "Commentatio de Motu Sanguinis," which has received too little attention in this country, the two would form a not inappropriate memorial of the natal year of William Harvey, of which we celebrate the three hundredth anniversary in 1878.

(To be continued.)

ON THE ETIOLOGY OF TYPHOID FEVER, WITH SPECIAL REFERENCE TO THE DISCUSSION INTRODUCED BY DR. GUENEAU DE MUSSY, AT THE ACADEMY OF MEDICINE, PARIS. (*b*)

By Thomas M. Dolan, L.R.C.P.E., &c., &c.,
Physician Halifax Fever Hospital.

Mr. President, Vice-Presidents, and Gentlemen,—Need I offer any apology for bringing this subject before you? Sir William Jenner told us in 1875, (*c*) that the mode of typhoid fever spreading by contagion was pretty generally admitted, but that the question of its *de novo* origin was *sub judice*, and could only be solved by the combined efforts of those who have investigated the origin of typhoid fever, when it occurs as an epidemic or in the form of a severe local outbreak, and of those practitioners who being engaged in private practice in country districts can examine and report on single solitary cases occurring under circumstances favourable for excluding fallacies.

The question is still *sub judice*, and we could not have a better opportunity than this assembly affords of eliciting the opinions of the general practitioners of England, whose importance Sir W. Jenner so graciously recognises.

It is also favourable in view of the discussion that has recently raged at the Paris Academy of Medicine, and also in view of the forthcoming International Congress of Science to be held at Geneva next September, where

Dr. Bouchard has taken the etiology of typhoid fever as the subject for discussion in the section of medicine. He has submitted the four following provisional propositions (*d*)

1st. That the contagious nature of typhoid fever from man to man by contact, inoculation, ingestion of contagious matter through the lungs or alimentary canal, has not yet been satisfactorily demonstrated. Dr. Bouchard, therefore, asks for new facts tending to establish the mediate nocuity of these matters, the time when such matter begins to be injurious, the period when it ceases to be so, the conditions which favour the development and propagation of the contagious qualities.

2nd. Whatever may be the solution given to the question of the origin of the morbid poison, Dr. Bouchard invites the communication of documents to throw light on the way of transport of the poison as air, water, which may serve as *media* for its introduction into the human organism.

3rd. Relative to poisoning by air, facts will be discussed tending to incriminate the injurious influence of emanations from privies, drains, dung-heaps, and statistics are desired to appreciate the action exercised on the health of workmen by emanations from these foci either in presence of, during, or after an epidemic.

4th. Relative to poisoning by water, facts will also be brought tending to prove that certain epidemics localise themselves around the wells supplying the affected quarter, or follow the course of the water conduits.

It will also be desirable to follow the progress of an epidemic, from one village to another along the descending course of the streams which supply the rivers and receive their dejections, and finally to ascertain what influence we must assign to subterranean waters, to their infiltrations and fluctuations. (*a*)

We see, then, the importance attached to this investigation in the land of Louis, who gave to this disease the appelation of Fiévre Typhöide, for aimost before one inquiry is finished we have the announcement of an appeal to an international tribunal.

You will also see the breadth and extent of the inquiry, the wide field open for discussion, the difficulties in the way of solution of the problem of the *de novo* origin. How far has the discussion at the French Academy assisted us in arriving at satisfactory conclusions?

What is the problem, and what are the opinions popular in the English medical world?

One of the Nestors of our profession, whose claims to speak on this disease are almost paramount to those of any other living authority, Sir W. Jenner, has placed almost in a nutshell the terms of this vexed question, He has shown us the desiderata for solving it, and has warned us of the dangers of reasoning upon insufficient facts, or an insufficient number of facts, and the unwisdom of drawing general conclusions from facts which bear only on one side of the question. What, then, are the terms of the problem according to Sir W. Jenner.

Firstly. It is said by some that typhoid fever is undoubtedly contagious, and being contagious it can never originate *de novo*, that is to say, as it can be proved in some cases to have its origin from the emanations of the sick into the previously supposed healthy, it can never arise in any other way. Might I say this is a form of belief we may call pure Buddism.

Secondly. While admitting the disease may be spread by the emanations of typhoid patients, it is also said that the admixture of sewage, decomposing animal excreta with fluids used for drinking purposes, although no typhoid excreta are present, will produce typhoid fever *de novo*.

Thirdly. It is said that inhalation of sewer gas is itself sufficient to produce in a previously healthy person typhoid fever *de novo*.

You are all familiar with the views of Murchison, who, after a careful survey of the various writers on this disease, after an elaborate summary of cases and a masterly analysis of their value, executed in a most cosmopolitan spirit, and

(*a*) In his own day, Harvey's writing was evidently a puzzle to his readers, for Dr. Ent, in his epistle dedicatory to the work on "Generation," which he edited, says: "As our author writes a hand which no one without practice can easily read (a thing that is common among our men of letters), I have taken some pains to prevent the printer committing any grave blunder through this." Many of my readers may already be familiar with Harvey's handwriting through the *fac-simile* of a letter of his, prefixed to Dr. Aveling's "Memorials of Harvey" (London, 1875), which fully confirms Dr. Ent's statement, as its authenticity is in its turn corroborated by MS. lectures.

(*b*) Read at the Annual Meeting of the British Medical Association, Manchester, August, 1877.

(*c*) Address Clinical Society of London. *Lancet*, Jan. 14th, 1875, p. 259.

(*d*) "Congres Periodique Internationale des Sciences Médicales,' p. vi.

(*a*) The latter part of the question bears on the theory of Pettenkoffer, that the rise and fall of the water in the soil (grundwasser) is the main element in producing typhoid epidemics. He did not believe in the contagious nature of typhoid fever.

with the fullest appreciation of the labours of our French *confrères*, arrived at the following conclusions :—

Firstly. That the disease should be called pythogenic, or enteric fever.

Secondly. That it is often generated spontaneously by fæcal fermentation.

Thirdly. That it is occasionally communicated by sick persons to persons in health.

Fourthly. That this transmission is probably affected by the stools, which are unusually prone to decomposition.

You know the opinion of Budd, that the poison of enteric fever always arises from the alvine evacuations of an individual suffering from the disease ; that the poison resides chiefly in the stools of the sick, and a drain is merely the vehicle of its propagation ; and though Murchison agrees with Budd that this theory is the best explanation in those cases where the fever is propagated by the sick, yet he thinks a necessary link is wanting in the chain of evidence—viz., as to the mode of introduction of the poison into the system.

The theory adopted by Dr. Latham is as follows :—

Firstly. That almost invariably the disease proceeds from a special poison contained in the alvine excreta.

Secondly. This poison is directly introduced into the alimentary canal, either in the food, or, most generally, in the water drunk.

Thirdly. That it is not yet proved that the poison is contained in, or disseminated by, the exhalations from drains, privies, &c., or that it can be absorbed into the system through breathing air contaminated with such exhalations.

I have quoted the opinions of these representative medical minds (*a*) to show that we have data on which we are almost all agreed, and must refer you to their published writings for the cases on which they based their opinions. I must next give a rapid glance at other evidence, as to the communicability of the fever by alimentation, water supply, tainted with typhoid excreta of some kind.

It has often been made a source of reproach that the medical mind, if I may so call it, is too much given to hasty generalisations, that it adopts opinions and theories as facts ; but were I asked for a practical contradiction of this, and for a proof of pure logical, inductive medical reasoning, I could not give a better specimen than the report of Dr. E. Ballard on the Islington epidemic of typhoid fever, July, 1870, traced to poisoned milk.

Since his investigation we have had numerous instances of poisoning by milk, notably those at Paddington, St. George's, Hanover Square, Marylebone, Eagley, Burnley, St. Pancras, Salford, and, in my own experience, one that occurred in the Shibden Valley, near Halifax, in the year 1873. I may say, *Ex uno disce omnes.*

Even though such a writer as Dr. Tidy seems to throw doubt on this view, and to regard it as a modern medical fashion, if the report of his remarks are correct at the reading of a paper by Dr. Stevenson, yet I think, in the face of the evidence we have, we can come to no other conclusion but that milk contamination, as a source of typhoid fever, is amongst the number of our best established etiological facts. We have equally strong evidence on the transmission by water tainted with typhoid excreta, so illustrative of cause and effect, that I need only mention the Croydon epidemic, and as an instance of the effects of an intermittent water supply, I must refer to the report of Dr. Bloxall on the epidemic at Shelbourne. I may say that we can furnish Dr. Bouchard with sufficient evidence on his two first propositions, if there is any value in the inductive method of reasoning when applied to the etiology of this disease, and the addition of further evidence will be like the heaping of Ossa upon Pelion, or borrowing from Shakespeare, the gilding of refined gold.

As regards the origin of typhoid fever from sewer gas, fæcal matter, impure water without a specific taint, and putrid food, we have the most difficult part of the problem. We have eminent names in favour of it, especially that of Murchison, who has given the name of pythogenic (produced by putrefaction) to the fever.

The evidence must necessarily be of a negative character, because Buddites may always say in a case of sporadic isolated typhoid fever, as there is no specific time given for the poison to lose its evil effects, and as an infinitesimal quantity has noxious influences, that at some very remote time typhoid excreta may have been present.

Here we have a difficulty of a very grave nature, for though we may have a sporadic isolated case where we cannot possibly trace any connection with a previous typhoid patient, still there may have been cases fifty, a hundred, five hundred, a thousand years ago in the locality.

Carrying this argument further, as we may suppose that typhoid fever existed in the time of the Ancient Britons—that is to say, as we have no positive evidence that it did not, some Ancient Briton may have deposited the seeds of the disease in some of our primæval forests where now human habitations exist ; and as it is said, *turdus malum sibi cacat*, so the fæcal excreta of some of our ancestors may now be producing their evil effects on their descendants, and we may now be suffering from their primitive habits.

This view, pushed to extreme conclusions, is not so absurd as may at first sight appear.

The vitality of life in various substances, under conditions supposed unfavourable, has been demonstrated by such facts as the springing into life of cereals found enclosed with Egyptian mummies, the preservation of scents when excluded from the air after a long lapse of years, as musk, and for fungoids by the spores of the mushroom.

Admitting the doctrine of *contagium vivum*, can we assign limits to its duration of life ?

Liebermeister (*a*) tells us there are several accounts in the annals of science of the production of typhoid fever by eating rotten food, sewage, &c., but their autochthonous origin is disputed, and I may give an instance from him of the line of refutation, which, unfortunately, only consists in putting one opinion against another. Liebermeister is a confirmed Buddite. He tells us that at Andelfungen, in the canton of Zurich, in 1839, more than 500 persons were supposed to have typhoid fever from eating putrid meat.

Griesinger has made this epidemic widely known, and states that the existence of ileo-typhus was anatomically proven, so that it was generally accepted as a proof of the spontaneous origin of typhoid fever.

Liebermeister says that he found with complete certainty that this epidemic was not typhoid fever ; he believed it was an unusual epidemic of trichinosis, but he acknowledges this belief was not confirmed when laid before the medical authorities of Zurich by Küchenmeister.

Dr. Sigg examined the bodies of two patients and found no trichinæ.

Now we have here the difficulty pointed out by Sir William Jenner, viz., of arriving at facts. But place the evidence in the scales of reason, and let us see to which side the weight leans.

Liebermeister was certainly wrong in saying it was trichinosis. It is not more than probable that he was also wrong in denying it was typhoid fever ?

We cannot rest satisfied with his simple negation and his subsequent suggestion, "that there is a particular disease produced by meat poisoning, as advanced by Lebert and Kohler." If there is any value in medical evidence it must incline to the views of Griesinger, who established the existence of ileo-typhus anatomically. I must not

(*a*) It is impossible to give all authorities in such a short compass, and I have had to omit several names, as that of Sir W. Gull, whose views will be found in a lecture delivered at Guy's Hospital, June 20th, and reported in the *Lancet*, June 29th, 1872, p. 896.

(*a*) Ziemssen's "System of Medicine," Vol. I., p. 61.

omit the opinions of Dr. Stokes, one of the most highly educated, highly trained, thoughtful, observant minds of the Irish School of Medicine, as expressed at the reading of a remarkable paper by Dr. Pratt (*a*) at the Surgical Society of Ireland, in 1872. Dr. Stokes then said :—

Firstly. That the sources of epidemics were not yet known, that Dr. Pratt expressed the same idea when he said "the wind bloweth where it listeth."

Secondly. That bad odours were not in themselves necessarily deleterious ; that labourers working in knackers' yards and in sewers did not appear to be more liable to disease than persons in the same class of life.

Thirdly. That it was wrong purely to say pythogenic fever proceeded from the putrescence of matter in which the seeds of typhoid matter had been mixed.

These views of Dr. Stokes are interesting, as they almost correspond with those of Dr. Bouley and Bouchardat. The discussion at the French Academy of Medicine arose from a work of Dr. Gueneau de Mussy, (*b*) presented at the sitting, November 28th, 1876, this work being a critical and historical study on the etiology and prophylaxis of typhoid fever, based on numerous observations from the memoirs of the academy, on foreign works, and especially on the writings of Budd and Murchison.

Dr. de Mussy is a confirmed partisan of the contagious nature of typhoid fever, and he incriminates the communication of the closets with the drains, of the drains with the atmosphere of the streets and private houses by the water supply.

He distinguishes the influence exercised by warm dry seasons when the drains are badly flushed and badly trapped, when fæcal typhoid excreta are suffered to be present ; but, he adds: "When the fluids of privies do not contain infectious principles, it is doubtful whether typhoid fever can be developed, even though they communicate with the drains."

Dr. de Mussy does not assist us in clearing up the *de novo* origin. He has adopted English views as regards specific contagion, and the highest value we can attach to his evidence is, that it is the opinion of an educated observant foreign mind.

Professor Jaccoud (*c*) supports Dr. de Mussy on the point of specific contagion.

He considers the fæcal origin of typhoid fever amongst the best established of our etiological truths, and the origin by transmission as the most positive, the best demonstrated, and the most demonstrable.

He believes we must eliminate facts observed where typhoid fever is endemic, and seek for light in localities where the disease does not exist habitually.

He supposed a case where typhoid fever breaks out in a locality where it has not been endemic ; an inquiry does not establish any cause, but the emanations from overfull closets, or the mixture of excrementitious matter with drinking water. Now if the epidemic ceases on the removal of these causes, he thinks we have all the elements of appreciation to attribute it to its true cause.

He has collected 196 facts or circumstances, bearing on this point, one of which I may mention.

An epidemic broke out in a Norwegian village, 1870, where typhoid fever was almost unknown.

The village possessed seven fountains and forty-four houses. Now there occurred 121 cases of fever amongst the inhabitants who used five of the fountains, and there was not a single case amongst those who used two of the fountains. On examination these five fountains were found to be specifically tainted.

Dr. Jaccoud supports us on the contagious nature, but he also expresses his opinion on the *de novo* origin.

His conclusions are, as expressed in his treatise on internal pathology, that the poison may strike the organism in one of three ways.

Firstly. In the air, in water, in substances, to the emanations of which the subject has been exposed—the extrinsic mode of origin.

Secondly. It may arise in the organism from the influence of certain bad conditions—the spontaneous mode of origin.

Thirdly. It may be reproduced like cholera-poison, and transmitted to healthy people—the contagious mode of origin.

M. Guerin (*a*) also contributed the results of his very interesting experiments, on the excreta of typhoid patients, made on rabbits. He attributes to the emanations from privies a direct influence on the development of this malady. But before arriving at this conclusion, he examined the following points :—

Firstly. Whether the deposited matter by the simple fact of its agglomeration, confined the morbid principles he attributed to it, or whether these principles resulted from some kind of alteration subsequent to its deposit.

Secondly. Whether the morbid elements are of a general character, or of a special nature.

Thirdly. Whether the emanations from the deposits possess this special, and even specific property, in virtue of the matter emanating directly from the patient.

Fourthly. Whether the typhoid principle, of which the matter excreted by the patient is the vehiculum, is developed after coming from the body of the patient.

This simple enumeration of particular questions (springing from the general question of the pathogenic influence of emanations from privies) shows what a complex problem we have to solve ; and in order to escape the confusion inherent to this complexity, M. Guerin has examined by the experimental method, whether the matter excreted by typhoid patients contains directly a well characterised toxic principle, which we may consider as the principal agent of the malady. He has collected for this purpose alvine matter from characteristic typhoid patients, and experimentalised on many series of animals.

In the first series of experiments he introduced subcutaneously into the cellular tissue of twelve adult domestic rabbits, on both sides of the thoracic walls, from four to five grammes of very fœtid fæcal yellowish liquid matter, ejected by a patient on the twenty-third day of his illness.

Out of these twelve rabbits five died on the day of the operation, two after two days, two on the third day, one on the fourth day, one many months after the experiments, one completely resisted.

In a second series he employed five rabbits. One was experimented on with blood taken from the heart of one of the dead rabbits of the former series ; it succumbed on the morning of the experiment. On two others he introduced fæcal matter furnished by two patients, one of whom was suffering from measles, the other from amygdalitis with feverishness. After some symptoms of malaise these two rabbits completely recovered, and the other two also recovered after being tested by matter furnished by a healthy subject.

A third series of twelve rabbits were experimented on with fæcal matter, blood from intestinal hæmorrhage, urine, mesenteric liquid, detritus of the mesenteric ganglions, and shreds of ulcerated intestine obtained from a typhoid patient who had died.

(*a*) Proceed. Academy Medicine, Feb. 25th. *Journal Therapeutique*, No. 5, p, 189. Translated by writer for MEDICAL PRESS AND CIRCULAR, June 28th, 1877, p. 492. On the point of the inoculability of specific fevers, see *British Medical Journal*, March 25th, 1876.

The results were still more marked, for all the rabbits died.

The symptoms were almost the same, general malaise convulsive movements, immobility, titulation, paralysis, disgust of food.

The autopsy revealed nothing particular unless some venous arborisation at the seat of the operation, and general turgescence of the venous system. There was exceptional fluidity of the blood in two cases.

In a fourth series of experiments on six rabbits, he used blood, urine, and fæcal matter, which had been preserved for four months, the residue of what had been employed in the third series. All the rabbits died.

M. Guerin has drawn the following conclusions :—

Firstly. The fæcal matter of typhoid patients contains from the time of its evacuation from the body a poisonous principle, capable of causing death to one class of animals in a few hours or a few days.

Secondly. Other excrements from typhoid patients, as urine, blood, mesenteric fluid, have the same properties.

Thirdly. These properties are preserved after many months.

Fourthly. The fæcal matter of subjects in health, or suffering from some disease not typhoid, do not possess these toxic effects.

The views of M. Chauffiard, and others, are interesting, but are not of much assistance, so I may pass on to the opponents of Dr. Gueneau de Mussy.

M. Bouley, the President of the Academy of Medicine, has entered into the lists as an opponent of Dr. de Mussy. He denies the influence of sewage on the disease, and asserts that the nightmen, those connected with the drains, those who visit the sewage, the workmen at the depôt of Boudy, are uninfluenced by the emanations of the dejections, and they do not appear to pay a larger tribute to typhoid and cholera epidemics than the other inhabitants of Paris. He challenges the statistics brought forward to prove the connection between the intensity of an epidemic and the bad state of the drains, and he strongly condemns the method of induction employed to verify these assertions. Going even farther, he believes the part played by drains to be eminently useful and almost indispensable. The chemical nature of the miasma or agent of contagion is not known, but it probably belongs to the group of organic substances.

It is well known that these substances disappear by fermentation. Now fermentation is constant in the drains, and the organic putrid matter, infectious or contagious, cannot escape its action. Hence the drains favour the destruction of organic contagious matter, whilst the dilution of such matter by the water also weakens any hurtful activity, and hence the well-known immurity of the workmen above described. (*a*)

This view reminds me of a saying attributed to an old eccentric Cork physician, that there could not be a healthier thing at a man's door than a fine dung heap ; but if this view is tenable, there is iittle use for medical officers of health or for the expensive machinery of the Public Health Acts.

M. Bouchardat, Professor of Hygiene at the Faculty of Medicine, declares that he has adopted and professed for twenty-five years the hypothesis of the contagion of typhoid fever ; but he does not admit that the sewers play any part in the diffusion of the poison. He denies the possibility of the *de novo* origin, and without explaining the mode of transmission, looks upon typhoid fever as an endemic disease of large towns.

What conclusion do I draw ? I hold that the weight of evidence leans to the views of Sir W. Jenner, Murchison, Budd, Gueneau de Mussy, Jaccoud, insomuch as it affects the contagious nature of typhoid fever and its transmission by specific poisoning by air, water, food of any kind, by emanations from drains, sewer gas tainted with typhoid execreta, and specially influenced by an intermittent water supply and by hot and dry weather.

Secondly. I also believe that the weight of evidence inclines to the special views of Murchison and to the three theories of Jaccoud—the extrinsic, the spontaneous, and the contagious modes of origin. I do not see how we can otherwise explain those sporadic and isolated cases that have come not only under my own notice during the past eleven years, but also those I have heard and read of, and I think a large number of general practitioners and Medical Officers of Health (*a*) hold similar views.

It is for you to decide whether I am justified in adopting such conclusions, in the present state of our knowledge, and with the evidence we possess, and it is for you to assist in the solving of the problem.

Your time has not, I trust, been wasted by my *resumé* of our position on the etiology of a disease, which possesses such great practical interest, which opens out such a wide field for inquiry, which bears so much on grave questions of hygiene, pure air, pure water, efficient drainage, sufficient water supply, clean and healthy habitations, (*a*) thereby becoming a national question, and I feel satisfied it will receive at your hands the calm, impassionate, impartial consideration it merits, and in this opinion I am confirmed by the attention with which you have listened to my remarks.

(*a*) See Murchison on "Fevers," p. 453, on the statement in reference to the supposed immunity of scavengers, nightmen, from typhoid fever.

Clinical Records.

ST. PETER'S HOSPITAL.

Stone in the Bladder.—Lithotomy—Death three weeks after the Operation.

(Under the Care of Mr. TEEVAN.)

JOSEPH B., 77 years of age, of no occupation, was admitted into the hospital, on April 9, 1877, with stone in the bladder.

History.—The patient and his father were born at Bergen-op-Zoom, Holland, and the mother at Rotterdam. He stated that, ten years ago, he began to suffer from frequency of micturition, attended with much pain. Five years ago he observed that he passed blood after taking exercise. For the past two years he has not been able to follow his business, and for the last three months has been confined to bed. Never suffered from syphilis, gonorrhœa, or rheumatism. Has occasionally passed some white gravel. Ten years ago he sought advice, and was told that his prostate was enlarged.

Present Condition.—The man is very emaciated and haggard-looking. Arcus senilis very marked in each eye. Wants to make water every ten minutes, day and night. Only gets half-an-hour's sleep from time to time. Is never free from pain. Suffers greatly at the end of the penis and just above the pubes. Urine contains much mucopus streaked with blood. The patient was kept quiet in bed, and well fed.

April 16th, 3 p.m.—Mr. Knott having administered ether, Mr. Teevan tried to pass a lithotrite, but could not, on account of the great enlargement of the third lobe of the prostate. He then attempted to introduce a rectangular staff, but could not. A curved staff, however, was passed, and given to Mr. F. Heycock to hold. The bladder was then opened by the lateral operation, the incisions being made very low down, to avoid the vascular parts. After the stone was grasped, and during its extraction, a probe-pointed bistoury was introduced to enlarge the wound by cutting outwards and downwards, in order to allow the calculus to slide out without any force being exerted. A portion of the stone, about the size of a shilling, was adherent to the mucous membrane of the bladder, and Mr. Teevan had to introduce his finger to separate the surfaces. There was but little bleeding, which soon stopped. The stone was of lithic acid, pyramidal, and

weighed 1¼ ounces. At 9 p.m. Mr. Horace Manders, the house surgeon, who took the following notes, found the patient's temp. 101, and pulse 100, exhibiting a rise on the morning's records, which were temp. 99·8, pulse 82.

17th.—Has passed a good night, and is free from pain. Tongue moist and clean. Pulse 84, temp. 99·5.

18th.—Has had an indifferent night. Complains of pain in left leg. Wound looks well. Tongue rather brown and dry. At 8 a.m., temp. 99·8, pulse 88; at 9 p.m., temp. 101, pulse 86.

19th.—Bad night. Cramp in leg still continues. 8 a.m. temp. 100·4, pulse 84; 9 p.m., temp. 100·2, pulse 88.

20th.—Slept well. Tongue moist and clean. Less pain and stiffness in leg. 8 a.m., temp. 100·2, pulse 100; 9 p.m. temp. 101, pulse 106.

21st.—Patient is better. Tongue clean and moist. 8 a.m. temp. 101, pulse 106; 8 p.m., temp. 101·1, pulse 93.

22nd.—Patient is very restless, and throws bedclothes about. 8 a.m., temp. 100, pulse 104; 9 p.m., temp. 100·8, pulse 100.

23rd.—Has had a better night. Tongue coated; bowels open. Passed some urine through penis yesterday. 8 a.m. temp. 99·6, pulse 98; 9 p.m., temp. 100·2, pulse 104.

24th.—Has had a good night, but is weaker, notwithstanding his appetite is good. 8 a.m., temp. 100, pulse 100; 9 p.m., pulse 99, temp. 100.

25th.—Tongue brown. Plenty of urine comes through the wound and a little through the penis. Suffers a great deal from thirst. 8 a.m., temp. 100, pulse 99·8.

26th.—Had a very bad night. Extremely restless. Wandered at times last night. Tongue coated in front and at edges, whilst the back of it was denuded of epithelium. 8 a.m., temp. 99·2, pulse 100; 9 p.m., temp. 100·2, pulse 84. Ordered beef-tea injections.

27th.—Had a good night, and is better to-day. 8 a.m., temp. 100·4, pulse 90; 8 p.m., pulse 90, temp. 100·2.

28th.—Had a good night, and is stronger to-day. 8 a.m., temp. 100, pulse 90; 8 p.m., temp. 100, pulse 90.

29th.—Good night. A small bed sore has made its appearance. Tongue very red. 8 a.m., temp. 99·8, pulse 94.

30th.—Diarrhœa has appeared, and some fæces have passed through the wound. 8 p.m., temp. 100, pulse 100.

May 1st.—Is much weaker. Had a bad night. Diarrhœa still continues, in spite of the medicine he is taking for it. 8 a.m., temp. 99·2, pulse 100; 8 p.m., temp. 99·6, pulse 100.

2nd.—Passed a better night. Bowels open about every two hours. Takes nourishment well. Temp. 99·8, pulse 98.

3rd.—Had a restless night. Eyes very sunken, pulse feeble. Bed sore much increased in size; it is dressed with equal parts of bals. Peruv. and ol. Ricini. Temp. 100·1, pulse 100.

4th.—Not so well to-day. Tongue brown. Takes little, except the brandy and egg mixture. Diarrhœa, chiefly mucous, every quarter of an hour.

5th., 8 a.m.—Extremely weak, sordes forming on teeth and lips. Pulse hardly perceptible. 8 p.m., has rallied considerably.

6th.—Had a bad night, and is much worse to-day.

7th.—Very weak. Motions harder, but still frequent.

8th.—Sinking, but quite conscious.

9th, 8 a.m.—Has taken plenty of beef-tea in the night, and has rallied a little. The improvement, however, did not last long, for, two hours later, a change for the worse came over the patient, who gradually got weaker, and died at 1 p.m. the same day. No examination was allowed.

Mr. Teevan observed that, although the patient's great age and exhaustion were greatly against the success of any operation, yet the excessive pain from which he suffered demanded relief. After the operation, he went on well for some time, but ultimately died through sheer exhaustion. In order to save the man's blood as much as possible, he had made his incisions very low, to avoid the vascular parts in the region of the bulb, and in doing so he had wounded the rectum with his knife. A wound of that part during lithotomy often occurred, but was of no consequence, and usually healed well.

Stone in the Bladder.—Lithotrity—Cure.

(Under the Care of Mr. Teevan.)

Thomas H., a clerk, aged 21, was admitted into the hospital, June 20th, 1877, suffering from a stone in the bladder, which had been detected by Mr. Teevan.

History.—Patient stated that he has suffered from pain in passing water since he was a child. Three months ago noticed that blood escaped from the penis after riding in an omnibus. He and his parents were born in London. Has never suffered from gout, gonorrhœa, or syphilis.

Condition on Admission.—Very pale. Is obliged to make water every quarter of an hour in the daytime when at business, but when in bed is little troubled. Suffers much pain at the end of the penis when urinating. His symptoms are greatly increased in severity by exercise, which is followed by an escape of a few drops of blood.

On June 25th, at 3 p.m., the patient was put under the influence of ether by Mr. Knott. Mr. Teevan then passed a lithotrite scoop, and caught a stone one inch in diameter, and with much difficulty crushed it.

26th.—Patient has expelled several fragments with much pain.

27th.—Had a good night. Some more pieces of stone have come away.

30th.—To-day the operation was repeated, four fragments being pulverised.

July 1st.—Much *débris* has come away. Only urinates four times in the day and once at night.

2nd.—Passed some blood to-day. Pulse 80, temp. 99·3.

3rd.—Several pieces have come away, and a little blood afterwards was passed.

4th.—Lithotrity again to-day.

5th.—Some fragments have come away to-day, attended with much pain. Temp. 99·7, pulse 76.

6th.—Free from pain. Pulse 72, temp. 98.

7th.—Lithotrity repeated.

9th.—Some *débris* passed after last sitting. Is much better, and has been out for a short walk.

10th.—Feels quite well. Examined, but no stone could be found.

12th.—Left the hospital in all respects well, and able to hold his urine for six hours. The stone was composed of urate of ammonia.

THE EFFECT OF BELL-RINGING MEDICALLY CONSIDERED.

The profession in America appears to be as much at variance in its opinions on small matters as in this country. The blue-glass cure of a few months ago "praised by some, condemned by others" gave place to blood-letting with similar results. Ice water followed, which in its turn has yielded to the engrossing topic of "Bells." Some regard the noise of bells as grateful to the invalid, and the associations connected with them as helpful to the soul, and therefore inspiriting to the body. Others regard bells as mischievous implements which by their clangour destroy rest, injure the nerves, and set up destructive changes in the ear and in the brain. They have gone to law about it, and the doctors says, the last No. of *The Clinic*, are strong on both sides. Here is what they have to say on the side of the complainant:—

"Now, the complainants testified that, by reason of the frequent, prolonged, overpowering noise, produced by these, harsh, loud, high, sharp, clanging, discordant bells, amounts to an intolerable nuisance. They claim that it shakes the walls of the houses, disturbs sleep, especially that of children and infants, distracts the mind from any serious employment; it lessens or destroys social and domestic intercourse, and much of all that which goes to make up the peace and happiness of home life. It is also claimed that this is a nuisance, not only to the well, but that positive harm is done to the ill, *especially to those whose nervous systems are delicately organised.* Moreover, it is averred that the nuisance is not confined to the time of the bell-ringing, but the expectation of its

beginning produces a nervousness and excitement, which to all is painful, and to some, intolerable."

Drs. Weir Mitchell, Da Costa, Gross, and a host of others, testified as above. On the other side were Drs. Addinell Hewson, Van Pelt and S. Little, who were equally confident. They viewed the subject in the following manner :

"The defendants deny each and every statement of the complainants, and what interests us most, they affirm that the sleep of no one is disturbed—not even children and infants, that the mind is not distracted, that social and home happiness are not destroyed, that the health of a single person has not been injured or impaired in the slightest degree. Moreover, the defendants claim that in many instances invalids have expressed positive gratification, and their recovery has been materially assisted by the chime, and that the alleged nervousness or excitement produced by the expectation that the bells will ring is not, in truth, a natural consequence of the use of the said bells, but is due wholly to a morbid, mental, or physical condition of the person or persons (if any) by whom such expectation is entertained."

Who shall decide when doctors disagree? Our contemporary does not give us the result.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
Is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
„ IF PAID IN ADVANCE 1 1 0

, Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.
A. H. JACOB, 3 Molesworth Street, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 5, 1877.

THE SANITARY IMPROVEMENTS AT GLASGOW.

THE paper which Sir James Watson has just read before the British Association shows how much may be accomplished in improving the moral and physical condition of the lowest and most indigent inhabitants of large cities. The municipal authorities of Glasgow were one of the first to take advantage of the Artisans' Dwellings Act, and it is to be hoped that the thorough manner in which they have set to work to carry out the measures sanctioned by that Act will be followed by other great centres of population. The authorities of Glasgow had no ordinary difficulties to contend with, such indeed as are not to be met with in any other city of the kingdom. Scotch prejudices, inveterate superstition, and the crowded and repulsive state of the dens in which the lowest classes were living—if living it could be called, presented many obstacles to the improvement in the sanitary condition of the more crowded districts of this densely populated city. Not the most notorious rookeries in London can vie with the dirt, poverty, squalor, that until recently characterised certain parts of Glasgow. Sir James Watson states, that before any improvements were effected, the people of whom we are now speaking were huddled together in pent-up houses, and in "closes" three or four feet wide, leading to staircases of large tenements of three and four storeys, which rose on each side and ran backwards to the extent of 280 feet, into which neither light nor air could freely enter. In fact, a worse place for the propagation of infectious diseases could not be imagined, to say nothing of the physical and moral degradation of the great mass of people shut up within its pestiferous precincts. When any contagious disease broke out in these localities it spread with extraordinary rapidity and committed great ravages among the inhabitants as if Nature would not, even if man did, countenance such a herding together of human beings as were to be found in the hovels and slums of Glasgow. Even as late as 1871, when some improvements had already been made, an epidemic sent up the death-rate to 70 per 1,000.

The way in which the Corporation of Glasgow set to work to overcome this great blot upon their great and thriving city deserves much praise. They had the town well surveyed. All the most obnoxious districts were condemned or marked out for improvement. Parliament was asked to sanction the expenditure of £1,250,000 in the purchase of property. The rate payers were invited to assist the authorities in carrying out the proposed scheme, and they readily submitted to be taxed at the rate of sixpence in the pound on their rental for the first year and fourpence for the second year. From 1866 to the present time, the committee appointed by the City Council to carry out the provisions of the Local Improvement Act have been indefatigable in the discharge of their duties. Up to the end of May, £1,612,504 had been spent upon the sanitary improvements. Forty thousand pounds are to be appropriated to the purchase of a public park; £65,000 to the paving of streets and the construction of sewers; and 18 acres of land have been purchased to be laid out in new streets and open spaces.

Such are some of the great enterprises upon which the Corporation of Glasgow has recently embarked, and the actual results of which were strikingly revealed in the interesting details to which Sir John Watson drew the attention of his audience. As these facts speak for themselves, it is needless for us to point out the moral which they convey. But it should be observed that the interest attached to the above statement does not so much centre in the great need there is for sanitary improvements in all large towns, nor in the beneficial results of carrying them out, for all this is pretty well known as in the vast reforms which may be accomplished in a city whose social destinies are presided over by a liberal, keen sighted, and enterprising corporation, by municipal authorities which, instead of being tramelled by conventionalisms and old prejudices, move with the times and are ever ready in

the interests of the community over whose welfare they preside, to adopt any measures which science or experience may suggest. What, however, we would impress upon the attention of both municipal and sanitary authorities is the fact that their improvement of towns must not end with the mere pulling down of old rookeries and the erection of more commodious and healthy dwellings in their place, but in taking also some means to reform the dirty habits of the rising generation of their respective communities, so that the new and more salubrious tenements provided for them may not, through overcrowding, or through their own filthy and vicious habits, become almost as loathsome and as unhealthy as those which they formerly occupied. As we remarked more than twelve months ago, DIRT and INTEMPERANCE are the two great enemies which the sanitarian has to contend against. Dirt in all its various forms, dirt personal and dirt general, may go far to undo all the good that should result from the most rigid working out of the Artisans' Dwellings Act. Our own Public Health Society is doing much good by disseminating, as we first suggested, among the working classes small tracts on various subjects connected with hygiene and the prevention of infectious diseases, and we would urge upon the Glasgow authorities the propriety of adopting a plan which is not only attended with little expense, but which could not fail to reach the homes, and influence the habits of the classes among whom the tracts were circulated. It would, in fact, enable the working classes to appreciate and to keep in a more decent condition than they have hitherto done, the tenements which have been provided for them, while experience would soon show them the comforts inseparable from a life of cleanliness and temperance.

UNION AMALGAMATION IN IRELAND.

THE Commission appointed in the expiring hours of the last Parliament to inquire into the working of the Irish Workhouse System is, practically, a preliminary move to justify the Government in pressing upon Parliament a wholesale amalgamation scheme in the early part of next session. The fact is—and it is a most agreeable dilemma in which Ireland is placed—that pauperism has so greatly decreased of late years that the workhouse accommodation of the country is immensely beyond its necessities. Emigration has greatly reduced the number of the working population, and the demand for land labour has proportionately increased, and by this means the workhouses have been drained of every able-bodied person who can be induced to work, while out-door relief has provided for many of the destitute outside the workhouse, leaving a comparatively small pauper population to be supplied with house-room at the public cost. Workhouses built to accommodate 1,200 persons have not for years contained more than 300 inmates, and this last year has witnessed a reduction of 31,000 in the number of poor who are burthened on the rates, and this falling off in the demand upon Irish workhouses has been accompanied by no commensurate reduction in the numbers or cost of staff, and, therefore, the yearly keep per head of Irish paupers has greatly increased. Coincident with this decreased claim for Union lodging, the demand upon lunatic asylums has so rapidly and so largely increased in (consequence of recent legislation which has gathered into the asylum all the lunatics which have hitherto existed in their own homes or the workhouses), that extensions of the buildings are constantly demanded, at vast expense in each case. This outlay of County taxes at the same moment when the workhouse stands nearly empty a mile away, is felt to be unjustifiable, and the Government has appointed a Commission for the purpose of ascertaining how far the Union accommodation can be concentrated. The first step has been to issue a circular to all Boards inquiring whether they are disposed to be improved out of existence. The queries put by the Local Government Board are as follows :—

"Whether, having regard to the extent, population, necessities of the sick and destitute poor, and proper administration of the Poor-law in the Union of Sligo, it would be expedient to dissolve such union and amalgamate it with any of the adjoining unions ; and if so, what portions should be annexed to each of such adjoining unions ?

"In the event of query No. 1 being answered in the negative, would it be desirable to dispense wholly or in part with the use of the existing workhouse of the union, and have the destitute poor accommodated in the workhouse of any adjoining union ; and if so, what union or unions ?

"Is any additional workhouse or hospital accommodation required in the union for the adequate relief of the destitute, and especially the sick poor, arising from any portion of the union being too remote from the workhouse, thereby entailing undue hardship upon the poor ?"

The reply has been alike characteristic and amusing. Every Board of Guardians in Ireland announces its deliberate opinion that the neighbouring unions ought to be amalgamated with it, and its emphatic protest against being itself amalgamated with anybody else under any conceivable circumstances. Each Board of Guardians is perfectly disposed to disestablish its neighbour, and is equally determined to resist being disestablished itself; and to this view we have not found one solitary exception. If the Government were unprepared for this response to their circular, they must have had little acquaintance with the feelings of Irish Guardians. The title of P.L.G. is the patent of nobility of the petty shopkeeper and tenant farmer, and it could hardly be expected that it and all the personal advantages of a position of authority in the locality would be surrendered without an outcry. If amalgamation of unions takes place, it must undoubtedly be effected in the teeth of the amalgamated Guardians and their officers, and the Government must have accepted a very serious contest when they have contemplated a wholesale disestablishment of petty oligarchies against their most violent resistance.

The bearing of this scheme upon the medical profession is obvious. If the 163 workhouses are reduced in number, their medical officers must be content to surrender their occupation. We cannot say that there is anything in the nature of workhouse medical relief to make its concentration impossible or difficult, and we cannot suggest that workhouses should be kept on hands if they can really be done without. But we hope that no attempt will be made to deprive the officers of these institutions of their functions and emoluments without reasonable compensation, and we shall resist such a pro-

position, if made, with all our force. The Irish Medical Association has already addressed itself to the Commissioners, offering its aid in the elucidation of the medical questions connected with the inquiry, and we shall watch with interest the development of the plans of Government. The only question which can arise as to the propriety of amalgamation, is as to whether the existing workhouse accommodation is ever likely to be required. If not, it ought certainly to be reduced.

Notes on Current Topics.

Progressive Pernicious Anæmia.

A NEW disease—as if humanity had not already sufficient imposed on its shoulders—has lately been introduced, discovered, or invented, by foreign physicians, and our contemporary, *Le Progrès Medical*, has in its number of August 25th, presented us with an able summary of it, which we abstract for our readers.

In 1871 Gusserow, Biermer, and after them a certain number of German physicians, gave the name of Progressive Pernicious Anæmia to a new disease.

The characters of this affection were discussed in two very interesting articles in Nos. 16, 17 of the *Progrès Medical*, 1876, by M. Brissaud. After examining the descriptions, and analysing the observations of the partisans in favour of this new disease, M. Brissaud concluded that as far as regards this anæmic form of disease there was nothing truly pathognomonic, either anatomically, or in the series of observed phenomena.

This opinion has been shared by most of the French physicians who have devoted themselves to the question, and was defended in a thesis sustained at the Faculty of Medicine, Paris, by M. Ricklin.

More recently in Nos. 24, 25, of the *Gazette Medicale de Paris*, 1877, some new facts have been related, bearing on the thesis of M. Ricklin, and Dr. Sevestre has, owing to this, been induced to give a *resumé* of the work of M. Richlin in the *Progrès Medical*, of which the following is the result :—

A. We must first eliminate from the group of so-called anæmias, *pernicious* and *progressive*, those cases amenable to recovery, as they are consequently neither pernicious or progressive.

B. Besides, to establish the existence of a malady which especially rests on the absence of lesions, we cannot reasonably accept observations unaccompanied by an autopsy.

M. Ricklin quotes the case of a patient under the care of M. Sée, who for a year presented no other symptoms but those of very serious anæmia. The partisans of *progressive pernicious anæmia* might have claimed this as an illustration, if an autopsy had not revealed the existence of absolutely latent *cancer* of the stomach.

C. Many facts have been observed in women, who, living under deplorable hygienic conditions, became pregnant time after time. An autopsy revealed fatty degeneration of the heart. These facts, according to M. Ricklin, placed them amongst puerperal chlorosis, a variety of anæmia known for a long time.

D. We must also eliminate all the facts where an autopsy has shown lesions, sufficient of themselves to account for a fatal issue, and for the symptoms observed during life, cardiac affections, purulent pleurisies, cancer, &c. These facts amount to twelve out of the number of thirty-nine in support of the theory.

E. It is evident, on the other hand, that the clinical table of *pernicious* anæmia, traced by Biermer and Immermann, being only a faithfulreproduction of leukhemia, and pseudo-leukhemia, all the observations on bones established by a *post-mortem* must be considered as patent examples of myelogenic pseudo-leukhemia. The intestine should be carefully examined; the intestinal leukhemia, observed by Behier, resembles in a striking manner the progressive pernicious anæmia Biermer.

Out of the thirty-nine cases collected by M. Ricklin, we must again eliminate nine, or perhaps fourteen cases. Since he wrote many others of a similar kind have been published, and one of the most curious is that recently narrated in No. 19-20 *Berliner Klinische Wochenschrift*, 1877, by Dr. Litten, assistant to Frerichs.

A woman, after successfully nursing two children for fourteen months, was attacked with serious symptoms, which were assigned to progressive pernicious anæmia. The blood presented a notable decrease in the number of red globules, with a very slight increase in the number of white ones. About the fifth day after admission to hospital, the white globules notably increased. The patient died, and a *post-mortem* revealed very pronounced fatty degeneration of the heart and alterations in the marrow of the bones characteristic of myelogenic leukhemia. This case seems to have been only one of myelogenic leukhemia. That is in effect the opinion adopted by Dr. Litten, but only for the last days of the malady. According to him, we must distinguish two distinct phases in this case, from a clinical and anatomical point of view; in the first phase the patient was simply attacked by progressive pernicious anæmia, in the second phase which lasted only four days, she suffered from myelogenic leukhemia.

F. Some cases included under the name of pernicious progressive anæmia must be ranked under that of interstitial nephritis.

G. Finally after having rejected all these facts, M. Richlin has reserved three cases.

One related by Scheby-Buch, is that of a seamstress, aged 64, whose breath and vomiting spread a pronounced odour of alcohol, and at whose autopsy was found, besides a cysticercus in the encephalon, fatty degeneration of the heart, of the epithelium of the kidney, and of the epithetic cells. The age and alcoholic habits of the patient, sufficiently accounted for these lesions.

The case of M. Lepine is one of extreme anæmia, the production of which is sufficiently explained by many causes acting concurrently in the same patient: distress, dyspepsia, prolonged intestinal catarrh, pregnancy. The denomination proposed by Gusserow, extreme anæmia of pregnancy, may be adopted for it, but there is no necessity to consider it as a new morbid species.

The case of M. Ferrand is relative to a pregnant woman, with diarrhœa, vomiting, fever, and who was delivered of a still-born child. Without even taking into account a probable affection of the kidneys, M. Ricklin believes that the symptoms are explained by the pregnancy, complicated with vomiting and diarrhœa of a woman placed under bad alimentary conditions. In conclusion, M. Ricklin says: It is well established that anæmia has only a purely symptomatic value, and that its gravity depends, above all, on the importance of the causes of the lesions engendering it The name of progressive pernicious anæmia should be re

jected, not only as a superfluous term, but because it tends to confound under the same rubric, affections absolutely dissimilar, and especially because it exposes us to the danger of losing sight in the treatment of anæmia of the exciting cause.

Dr. Sevestre believes these conclusions rational, and that new facts will only tend to confirm them.

Germain See on Salicylic Acid and the Salicylates.

THE learned Professor has drawn up the following therapeutical *resumé* on the action of the above remedies :—

1. As an external antizymotic medicament, salicylic acid has an indisputable action, but it does not exceed that of phenic acid, and has no other advantage but that of being odourless ; as an internal antiseptic it does not present any appreciable effect either in purulent affections, or in contagious and parasitic maladies as diphtheria, hrush, or in gangrene, or in diabetes.

2. As an anti-pyretic medicine, the salicylate and salicylic acid enjoy transitory and doubtful properties even when applied to specific miasmatic virulent fevers, thus they have no marked superiority over the sulphate of quinine, the salicylate of quinine itself cannot yet take a definite rank in therapeutics for Marsh fevers. Powerless in the cure of variola, the salicylate of soda has not established its efficacy in the treatment of typhoid fever. Its power as a febrifuge is most limited.

3. Fifty-one cases gave evidence of its certain and prompt effects in acute articular rheumatism, so much so that its cure may be relied on in the space of three or four days. In simple chronic rheumatism, experiments have been equally satisfactory; and also in the acute attacks which occur from time to time, either in simple rheumatism or in arthritis, the painful attacks cease as quickly as in acute rheumatism. Nay more, the articular enlargement considerably diminishes and movement becomes free even after years of pain, rigidity, and immobility, provided that osseous lesion is not too deep and too far advanced (a dozen cases of chronic rheumatism cured or ameliorated).

5. In acute and chronic gout the results are most remarkable; in the first experiments the most painful acute attacks were arrested with the most striking promptitude, in the space of two or three days the pain, the articular swelling, the redness of skin and sensibility to touch had all disappeared. Its application in chronic gout is no less marked. By this method of continued treatment, even in moderate doses, patients are absolutely protected from an acute attack, whilst chronic perivascular enlargement disappears, the tophi diminish and cease to inflame. In a word, recovery may be completed without metastasis to the heart, stomach, respiratory organs, or the brain ; and in twenty-one cases noted there was not the least tendency to retrocession of gout to the internal organs. The only inconvenience is some derangement in hearing, and sometimes a certain degree of weakness or narcotism ; the latter phenomena disappear on diminishing the dose, but the disturbance of the auditory apparatus is more persistent. Amongst affections of a gouty nature as gravel, the salicylate of soda is very beneficial, as it favours elimination and soothes nephritic pain.

6. Salicylic treatment appeared advantageously to modify certain forms of facial neuralgia, but this action is not definitely established, and the same may be said of its use in sciatica.

7. In painful affections of the spinal cord, salicylate of soda produced appreciative sedative effects, but a certain degree of weakness may result from persisting in its use.

Therapeutics of Tetanus.

AN anonymous writer in the *Practitioner* for August gives an interesting retrospect of the medical treatment of tetanus, from which we extract the following notes :— *Chloroform* has had an extensive trial ; it has been administered in large quantities, sometimes with apparent success. Simpson narcotised a child for thirteen consecutive days, using ℥100 with mercury. But the general result is that while all the fatal symptoms disappear on the inhalation of chloroform, they return on its removal with unabated violence, and the disease generally lands them to its fatal conclusion without delay. *Chloral hydrate* has now taken the place of chloroform in the treatment of tetanus, but without more success. There appears to be great tolerance of the drug, and a case is quoted of a child of 12½ years who took more than 100 gr. a day. Dr. Ballantyne, of Dalkeith, gave ℥iij. in twenty-four hours, and ℥vj. in five weeks, with success, the patient during this time being easily aroused to speak. It seems, however, to be a valuable drug in alleviating the symptoms. Its injection into the veins and its subcutaneous injection have not been so successful. *Calabar bean*, which, like chloral, affects the spinal cord, and has little or no action on the motor and sensory nerves, has been recently much employed. As with other drugs, its administrationn has been at one time apparently successful, and at another a perfect failure. It has, moreover, to be given in comparatively large doses. The spasms are controlled and the body heat sinks, and if the drug be withheld the paroxysms return, while if it be pressed the patient comes into a somewhat dangerous condition. A large dose is required to produce by subcutaneous injection contraction of the pupil, sometimes as much as ⅓ gr. every two hours. There is not much to be said in favour of either *opium* alone, or opium combined with chloral; while *nitrite of amyl*, *bromide af potassium*, and *conium* have been alike tried in vain. A more favourable report is given of *aconite*, the exhibition of which has been attended in some cases with remarkable results. It lowered the pulse, which fell in one case from 135 to 60, with a simultaneous decrease of the convulsions ; but the effects of the drug constitute in themselves a new danger which must be carefully controlled. Tendency to syncope, wakefulness, vertigo, dilatation, and insensibility of the pupil ; small, intermittent, and irregular pulse, and intreased irritability of the nervous system are often the result of giving this remedy. The writer of the article referred to believes that such a summary as he has given makes an appeal to pathology to throw fresh light upon this disease, and he hopes that some combination of these

agents will be able to accomplish what each one of them singly has been found unable to accomplish.

We have no doubt that we shall one day find a remedy that is as really successful in the treatment of tetanus as the bromide of potassium has been found to be in some forms of epilepsy; but just as we are not indebted to pathology for the discovery of the therapeutic virtues of the bromide in epilepsy, so we are far from being sanguine that pathology will point out by-and-by the drug or combination of drugs which will cure the disease under consideration. In all probability the chemist or the botanist has already provided the remedy; and perhaps it remains for empirical experiment, rather than for physiology or pathology, to find it out.

The Hospital at Scutari.

From the letter of an English colonel who recently visited this hospital, we learn that at the time he wrote, Aug. 16, "there were 1,184 patients, most of them badly wounded; some few were suffering from ophthalmia, probably caused by the fez, which leaves the eyes without any protection from glare or dust. They were all wonderfully fine men in physique, and, from the absence of alcohol or any sort of intoxicating drinks, seemed to suffer comparatively little. The lives they lead keep their blood in such a healthy state that their wounds generally heal in an extraordinarily short time. Amputations are not here performed without the permission or wish of the patient. Their objection is based on the idea of 'going maimed before Mahomet;' and this so strongly that, as a rule, death is preferred. Sometimes, however, the love of life asserts its power, and operations are borne cheerfully and manfully. The rooms were clean and sweet, the beds possibly too near, unavoidably so on account of the crowded state. Charming gardens for the use of convalescents surround the hospital. It is not the one formerly occupied by the English, but solely Turkish. It stands almost behind the English burial ground. The doctors, most of them, speak French. They seemed intelligent, sympathising men. The worst case amid this vast amount of sufferers was that of a Bimbashi, Fezoli Pasha, who, besides several bad wounds, had lost his left arm and right leg. He was cheery, and much gratified by our visit and General Baker's kind words and manner."

From personal experience we corroborate some of the above statements. When visiting the wards of the old English hospital at Scutari in 1856 we were struck with the remarkably cool, patient, and resigned behaviour of the wounded soldiers. For the reason above-mentioned, they never appeared to have any dread of dying, and this freedom from care or fear of any kind, coupled with their abstemious habits, and the consolation afforded by their mild tobacco, had much to do with the rapid healing of their wounds and their recovery from bad gunshot injuries which would have proved fatal to some of the inmates of our own hospitals. At Schumla Hospital we recollect seeing a man who made an excellent recovery, although he had been shot through the chest, the ball having entered between the 4th and 5th rib in front and come out a little below the scapula behind and seriously wounding the lungs.

The Medical Defence Association.

We have before us the first annual report of this Association presented by the Council at the recent annual general meeting. It is of a most encouraging character, and the value and importance of the work done fully justifies the existence of the Society. It appears from the report that, during the first year of its existence the Association has been joined by 400 members, and that no less than eight provincial branches have been formed in different parts of the country. Of the action of the Association against unqualified practice, it appears that the London organisation instituted and carried through successfully seven prosecutions against chemists and others practising illegally, and in the provinces several unqualified persons have been compelled to cease practising through the efforts of the Association. The report refers to the action of the chemists in claiming the *right* to prescribe in medical cases, and expresses confidence in the power of the Association to resist this pretension. Other topics are touched upon for which we must refer our readers to the report itself, which may be procured on application to the Hon. Secs., Messrs. G. Brown and Douglas Hemming, at the offices, 6 John Street, Bedford Row. We are extremely glad to see that this valuable Association is doing such good work, and would earnestly commend it to the support of all members of the medical profession for the maintenance of whose just rights it is established, but without whose material and moral aid it will be impossible that the work can be successfully continued. All medical men who have the welfare of themselves and the public at heart, should support this movement for the suppression of the ignorant and unqualified pretenders to medical knowledge who prey upon the pockets and health of the community.

Effectual Quarantine and the Prevention of Cholera.

The Paris correspondent of the *Daily Telegraph* informs us that the cholera has broken out on board the Government ship *Correze*, on her return voyage from Cochin-China, for which place she left the port of Toulon last May. No alarm need, however, be felt at this startling news, inasmuch as every precaution has been taken by the government to prevent the spread of the horrible infliction. The Minister of the Marine had been previously informed of the fact by the captain from Singapore, and has taken the following precautionary measures: The *Correze* may be expected to arrive at Toulon in a day or two, but she will not be allowed to enter the port. As soon as she is signalled in the Mediterranean waters she will be directed to remain in the offing in view of the Hyères Islands, to which two ships will be sent to receive the passengers and crew, who will go through a certain number of days of quarantine before landing. The *Correze* will then be scuttled, and left under water until she has been sufficiently purified by the sea water, after which time she will be raised. The two other ships, which will take off the passengers and crew of the *Correze*, will in their turn be relieved of their burden and sunk for a time, in the same way as the *Correze*. By means of these precautions it is hoped that the course of the pestilence will be interrupted.

It is not often we hear of quarantine being carried out

in such a thorough manner, and could we always ensure the adoption of such summary proceedings, cholera might be for ever kept out of Europe. At the great International Congress held at Vienna, quarantine as a means of preventing the spread of cholera was a great subject of discussion, and they came to the conclusion that it should not be abandoned whenever it can be effectually put into practice. The American physicians are also, as we noticed some time ago, strongly in favour of the rigid enforcement of quarantine; but they placed their confidence in the liberal use of disinfectants, and never did, as far as we are aware of, resort to such extreme measures as that of scuttling a vessel and leaving her for some time under the water.

The Hertford Hospital, Paris.

Visitors to Paris are probably aware of the existence of a hospital devoted to the reception and treatment of British subjects, even if they have not seen it. In its origin it was an appendage to the English ambulance during the siege of Paris by the Germans, and during the short but terrible reign of terror of the Commune, in 1871. Thence that great philanthropist, Sir Richard Wallace, recognising the need of British residents in that city of a hospital where they could repair for treatment under the various afflictions to which flesh is heir, transferred the hospital to a hired building in the Route de la Révolte, which he has supported ever since at his own expense, and last week he added another to the long list of public benefactions by laying the foundation-stone of a new and permanent hospital, in the Rue de Villiers, outside the fortifications, which he intends building and endowing in the handsomest manner. Sir John Rose Cormack, M.D., Dr. Herbert, Dr. Greenway, and others, were present at the interesting ceremony, and testified to the esteem in which Sir Richard is held throughout France, and the debt of gratitude which British residents in Paris owed him.

Referring to the objects of the Hertford British Hospital, Sir Richard said it is with much satisfaction that I hear from all quarters of the great reputation which our hospital has already acquired; but here I must, to a certain extent, qualify the expression of my satisfaction. We have received—without knowing at the time—as resident patients one or two persons who have come from London expressly to be received for treatment. This is an abuse of our institution, against which I strongly protest. The Hertford British Hospital is for British subjects resident in Paris, suffering from accidents or acute diseases, who are unable to pay for medical attendance at their own homes or in a *maison de santé*. There is another limitation of our sphere, which I must take this opportunity of mentioning, for it does not seem to be generally understood. We do not offer an asylum to those who are permanently infirm from age or other causes; and except under very special circumstances, we do not receive persons affected with incurable chronic diseases. Were we to do so, all our beds would very soon be permanently occupied, to the exclusion of the class of patients for whom our hospital is intended. The physicians of the hospital—to whom the selection of suitable patients is solely confided—entirely agree with me in the absolute necessity of the limitations to which I have adverted. To the experience of Sir Richard Wallace, most hospital surgeons could add testimony. There is scarcely any species of meanness to which some well-to-do people will not stoop in order to get medical treatment for nothing, and we are glad to observe signs of caution exercised in this direction at some of our large hospitals, which cannot be but productive of good.

Able-bodied Paupers in Irish Workhouses.

It has often been a subject of astonishment to us that the country ratepayers of Ireland, who are on the whole a most parsimonious and selfish class, should continue, from year to year, to maintain in idleness a considerable army of able-bodied paupers, male and female, whose only disqualification for labour is inconceivable laziness. This, at at a time when farmers are at their wits' end for hands to cultivate their ground, and when wages to labourers are amply sufficient for the comfort of the workman, is incomprehensible, yet from year to year it goes on, as a relic of the times when the labourer could not get more than ninepence a day. In the Wexford Board of Guardians this subject came under debate last week, upon the motion of a guardian that all the able-bodied inmates of the workhouse be discharged. "It was," he said, "a hardship on ratepayers to support such a deal of women and girls. There was plenty of work outside. It was a burning shame to society to see the women and girls with their illegitimates in the house. There was one girl who had three sons, the eldest 12 years old. The union had reared herself and children these twelve years. The father of these children had thousands and thousands of pounds, and yet he could have children reared for him by the union. It is very galling to see the father of these children dashing with his steeds through the country, and we depressed ratepayers paying for the support of his sinful offspring."

It is a subject well worthy of the Workhouse Commission which has just been appointed, and as it is contemplated to combine unions and abolish workhouses, the opportunity may arise for decreasing the pauper population by forcing the idle men and vagrant women to work for their livelihood.

An Epidemic of Lead Colic.

At the sitting of the Society of Public Medicine, Paris, July 26, 1877, Dr. Du Camp furnished a most interesting paper on sixty-five cases of lead poisoning observed by himself in Paris. In the presence of such a large number of sufferers with the special symptoms of lead poisoning, occurring in the same quarter, Dr. Du Camp directed his attention to the cause of this outbreak, taking into consideration the causes common to all his patients. He could not incriminate the wine nor the provisions, but a baker's family were also sufferers, and all the patients with the exception of two obtained their bread from this baker. These two, though they did not purchase their bread direct from this bakery, yet took their food at an eating-house supplied by it. The inquiry seemed thus limited, and the cause sought in the bakery in question. The town's water was used but was free from all suspicion, so Dr. Du Camp

directed his attention to another point, in consequence of a fact communicated to him by Professor Gubler.

Some years ago M. Gubler had noticed many cases of lead poisoning at a pastry-cook's who employed old wood painted with *white lead*, to heat his fires. After a laborious inquiry Dr. Du Camp found that the same cause operated in the present instance. The baker used old wood covered with *white lead*, and the fire set free *oxide of lead*.

Professor Carnot found lead in the bread. The manner in which the lead deposited on the bread gave rise to a very extraordinary fact. Amongst the patients was a lady and her maid; the maid having bad teeth, her mistress gave her the crumb, taking herself the crust; in consequence of this unequal distribution the maid escaped, whilst her mistress was poisoned.

Counter Prescribing.

The *Journal* of the English Pharmaceutical Society enters in its last issue upon an elaborate apology for the vote of the Council, who—as our readers are aware—have decided to expend the funds of the Society in defending counter practice. The journal says:—

"It is against the unreasonable application of the Apothecaries' Act that chemists are now protesting, and that the Council of the Pharmaceutical Society has decided to take action. It is therefore only by an unwarrantable straining of the terms of the Council's resolution that it can be represented as indicating a determination to defend medical practice by chemists. The Society as a body has always sought to develope the opinion that the business of the pharmacist should not comprise the prescribing of medicine; but under existing conditions the general acceptance of this view of the case can only be regarded as a desideratum which may be realised at some future time. It is futile to suppose that the Pharmaceutical Society can put a stop to the practice which has long prevailed amongst chemists, though many of its members abstain from it themselves and would gladly see their example followed."

We would ask the *Journal* to observe that the Society takes up rather a peculiar position when it undertakes to defend a breaking of the law in every case when such infraction seems to it not "unreasonable." It will be no easy task for the Society's solicitor to decide where the limit of an "unreasonable" prosecution begins, and it may be anticipated that—after a year or two—the *Journal* will find it difficult to imagine a case in which it is not perfectly reasonable and defensive for druggists to act as doctors. The pronouncement of the *Journal* on this subject is rather puzzling, for while it says that the Council holds the opinion "that the business of a pharmaceutist should not comprise the prescribing of medicine" it at the same time looks upon such a view as utterly Utopian, only "to be realised at some future time." The Council adopts a peculiar method of leading up to this realisation when it decides to maintain at law the right of a druggist, under certain circumstances, to prescribe in the teeth of the law. Perhaps it may be true that the Council cannot "put a stop to the practice," but they can, at least, refrain from approving, encouraging, and defending it.

There were 19 deaths last week in London from fractures and contusions. All were the result of accident, and in each case inquests were held.

An Inquisitorial Deadlock.

On Friday last, the coroner held an inquest at Shanagolden, in the co. Limerick, on the body of a labourer named Moore, who was found dead in bed on the 23rd inst. Two witnesses deposed that death was the result of natural causes. The coroner said he would adjourn the inquiry with a view of having a *post-mortem* examination on the body, as he apprehended the deceased had been poisoned. The jury protested against such a course being pursued, as they considered that there was not the slightest ground for the coroner's suspicion, and they agreed to a verdict of death from natural causes. The coroner then discharged the jury, and adjourned the inquest until Saturday. The inquest was resumed next day, a fresh jury being sworn. Doctors O'Brien and Hedderman deposed they had made a *post-mortem* examination, and found that deceased died from disease of the heart, lungs, and spleen; that they found no symptoms of poison, but they could not say whether the stomach contained poison, as they had not examined it. The coroner again adjourned the inquest *sine die* for the purpose of having the stomach of the deceased sent to Dublin for analysis.

Medical Women.

The threatened invasion by the women of the sacred precincts of the professional domain has fairly commenced, no less than four "lady doctors" having been entered on the *Medical Register* during the last six months. They are Louisa Catherine Fanny Atkins, of St. John's Wood; Eliza Louisa Walker Dunbar, of Clifton, Bristol; Frances Elizabeth Hoggan, of Rutland Gate, S.W.; and Sophia Jex-Blake, of Bernard Street, St. Pancras. These ladies have been admitted to the profession by the Irish College of Physicians upon one-half the examinational test to which ordinary students are submitted, and there seems no improbability in the apprehension that through the same portals there may come a real invasion of the lady doctors, attracted by the easy terms upon which they are allowed entry. By all means let them have a fair chance in the competition of medical practice, but—if they mean to hold their heads up in the contest—they must voluntarily submit themselves to the full test from which the College of Physicians is so complacent as to exempt them. They cannot claim equality of rank until they prove their equality of attainments.

Properties of the Human Gastric Juice.

M. Charles Ricket has, says the *Lyon Medicale*, been experimenting upon the patient on whom Verneuil recently performed the operation of gastrotomy. According to his researches the acidity of the gastric juice is equivalent to 1·7 grammes of hydrochloric acid to 1,000 grammes of fluid. This acidity increases a little at the end of digestion. Wine and alcohol also increases it, but cane sugar diminishes it. It tends to return to its normal acidity after the introduction of acid or alkaline matters. The mean duration of digestion is from three to four-and-a-half hours, and the food does not pass gradually out of the stomach, but in masses. According to four analyses, after a modification of Schmidt's method, free hydrochloric acid exists in the gastric juice; and altogether this

secretion appears to consist of one part of lactic acid to nine parts of hydrochloric acid, the former of which is free in the gastric juice. The nature therefore of the free acid in the stomach seems almost solved, and it may be said that in every 1,000 grammes of the juice there are 1·53 grs. of hydrochloric acid and 0·43 of lactic acid.

Superstitions regarding Hydrophobia.

As an illustration of what curious superstitions still lurk amongst rural populations, the *Students' Journal* mentions that at Rivesaltes, in the south of France, some terrible cases of hydrophobia have recently occurred. The local authorities, therefore, determined to adopt preventive measures, and accordingly sent for some *salondadons*, or, as we should say, *seventh sons*, who in those districts are believed to have the miraculous power of curing the bites inflicted by mad dogs, and of blessing small pieces of bread called *passagnats*, which are supposed to ward off hydrophobia. The *salondadon* performs his cures by means of a crucifix, uttering the while various sacramental words from a liturgy peculiar to himself. The seventh sons are supposed to have a variety of other powers not granted to ordinary mortals, such as treading under foot or applying to the tongue a bar of red-hot iron without receiving any injury.

The Tubercula Quadrigemina.

Professor Kohts, Strasburg, relates in the *Archives of Virchow*, August, 1877, a case in which a tumour, the size of a small cherry, developed in the posterior tubercula quadrigemina. It had destroyed them, but owing to its small size had produced little peripheric disturbance.

The principal symptoms were well-marked locomotor ataxy, very soon accompanied by strabismus. This latter fact signified that the origin of the oculo-motor had been attacked, and as they are situated near the medium line, in the tubercula quadrigemina, that the tumour had its origin at that point, from which it may be concluded that these ganglia are allied to the co-ordination of movement. Besides this lesion, there was a cerebellar cyst, but Dr. Kohts thinks that the tumour of the tubercula quadrigemina began first.

From experiments on animals he found that in frogs the optic lobes which correspond to the tubercula quadrigemina form the centre of equilibration. The posterior tubercula quadrigemina are the organs of movements of co-ordination in these animals. From the relation existing between the tubercula and the coverings of the brain a lesion of the membranes may produce ataxy by reacting on the tubercula quadrigemina.

Death of Dr. Henry Montucci.

The French journals announce the death, at the age of seventy, of Dr. Henry Montucci, a writer well known in the French literary world, and particularly connected with *Galignani's Messenger*. He spoke and wrote with equal facility six languages, and his published works in German, Italian, French, and English, bear testimony to his industry and learning. He was professor of German and English at the College of St. Louis, and more recently examiner o the candidates for St. Cyr.

Dr. Collier, Medical Officer of Health to the Fulham District Board of Works, at the meeting of that board, reported that during the past month 24 cases of small-pox had occurred in the district. Fourteen of the cases were reported from one street—viz., Rectory Place, Walham Green, where the outbreak had been so serious that a public house there had to be entirely closed, and many other houses also, scarcely a house being free from it. He attributed the spread of the disease in this street to the fact that he was not informed of its first outbreak there till a fortnight after it had occurred. He went there immediately, and found a woman, who had been the first person attacked, just recovering and sitting in her own room, among a number of neighbours who had called to congratulate her on her convalescence. The woman was then in a most dangerous condition for spreading the disease, and the consequence was that the infection was conveyed to the houses of her visitors, and shortly afterwards four deaths took place. The report was referred to a committee. *Apropos* of the above, we also learn that on Tuesday night week, at Deverell Street Chapel, New Kent Road, Mr. Thomas Baker delivered an address on vaccination. Thousands of lives, he contended, were sacrificed annually in this country "by the superstitious practice of vaccination."

The annual collection of the Hospital Saturday Fund took place in the streets and workshops of London on Saturday last. There were 150 street-stalls presided over by ladies, and we were pleased to notice that the objectionable touting of boys in livery, cabs dressed in bunting and plastered with huge begging posters were all dispensed with. When the returns are furnished we hope that they will show results consonant with the improved organisation and working of the Fund.

It is reported that insanity, especially among females, is terribly on the increase in the South of London. It was stated at a meeting of the Board of the Wandsworth and Clapham Union on Thursday last, that a letter had been received from the Brookwood Asylum, to the effect that no more patients could be admitted on the female side of the institution. Other asylums in the district are said to be similarly crowded.

A lady of independent means, named Mary Ann Hodgson, an inmate of the Northampton Lunatic Hospital, has committed suicide in a very painful way. She procured some scraps of paper unknown to the keepers, and managed to get from the dining-room to an empty sitting-room, where she lighted the paper at the gas, set fire to her underclothing, and was burned to death.

The Sanitary Institute of Great Britain will hold an autumn congress at Leamington on Oct. 3rd and three following days. Dr. Richardson, president, will deliver the introductory address. There will be an exhibition of sanitary apparatus, appliances, and articles of domestic utility in the Drill Hall, Leamington, open from the 3rd to the 18th of October. Mr. C. Marsh is the curator, 20 Spring Gardens, London, W.

Dr. B. W. Richardson, of London, commences this week a temperance lecture tour in Ireland, and his visit is looked forward as a festival by the friends of total abstinence. His zeal in the cause, his noted eloquence as a lecturer, and his high rank as a scientist, together constitute him the most influential champion of total abstinence in Great Britain.

At the examination lately held of the Whitworth Scholars of the third year, Mr. William Sisson, student of the College of Science, obtained the first place and the annual prize of £100, with the term prize of £200; and that Mr. Daltry, a former student of the College, gained the prize of £20.

The mortality from small-pox in London has been reduced to a minimum. From 144 deaths six months since, we have now only 11 per week, of which 9 occurred in the Metropolitan asylums, and two in private dwellings. The disease may now be looked upon as stamped out.

Yellow fever of a virulent type has just appeared at Jamaica. We regret to hear that a son and daughter of the late Lieutenant Governor have been carried off, within thirty-six hours of each other, by this terrible scourage.

The mortality last week in Edinburgh was only at the rate of 15 per 1000 of its population, 19 in London, 20 in Glasgow, and 22 in Dublin. These returns are all below the average.

Correspondence.

HYDROPHOBIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I have just read an interesting article in the *Daily Telegraph*, evidently written by a medical pen, on the most deadly of all diseases known to us, and I think that the profession should endeavour to pronounce some definite opinion on this disease. The most varied opinions exist as to the period of incubation, and with all the facts we have, I think it quite possible or ought to be possible, to definitely settle this point.

The death of Mr. Alfred Brown, veterinary surgeon, has increased the excitement in the public mind—Did Mr. Brown die of hydrophobia? Mr. Fleming an authority on veterinary surgery, states that the disease shows itself in man in from one to three months, after the infliction of the bite. Is this an opinion or a fact? According to the *Telegraph* the cases are rare in which it has developed itself after three months, and still more so in which it came on from the sixth to the twelfth month.

The writer further questions the authenticity of the instances in which the disease is said to have set in a year after the patient had been bitten, so that according to Mr. Fleming, Mr. Brown succumbed, not to genuine hydrophobia, but merely to nervous tetanus, or else he must have been recently bitten by a dog or in some other way become inoculated with the saliva of a rabid animal, without being aware of the fact. Dr. Bardsley of this town recorded a case in a man who had been bitten twelve years previously. This seems a long period for incubation, though it is difficult to deny a case reported on such an authoritive statement.

Yours truly,

A Surgeon.

Manchester, Sept. 1st, 1877.

MENTAL HYDROPHOBIA. IS THERE SUCH A DISEASE?

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—This would have been a proper subject for the British Medical Association, a practical one, and one in which every one is interested. The public are looking to us for light; naturally as we are their instructors, the lay press has taken up the subjects, and such papers as the *Globe*, have devoted some of their space to it. I do not advise medical correspondence in lay papers, when men sign their names with their qualifications and addresses, but I cannot see any harm in it, as long as it is not made an *auto advertisement*, and is purely scientific.—I should very much like to have a discussion on this question.

Apart from the question of pure rabies, can we have the group of varied symptoms to which we have given the name of hydrophobia (from the prominent feature not always present) without the supposed essential cause—the bite of a rabid animal? From my own experience I must answer in the affirmative, though veterinary and medical authorities assert that rabies and tetanus cannot be produced by mental disturbance, and the most powerful imagination could never enable a man to simulate the characteristic symptoms of either disease. These *dicta* are at issue with French authorities. Chomel recognised three kinds of hydrophobia—1. Simple horror of liquids; 2. Symptomatic hydrophobia; 3. Rabiform hydrophobia or spontaneous rabies. The first two divisions are well known and are unimportant. Valleix recognises Chomel's divisions, and, describing rabiform hydrophobia, says (p. 73, tome iv). :—"Elle a pour causes principales la peur soit d'avoir été mordu par un chien enragé ou un hydrophobe soit d'avoir contracté la rage en communiquant avec un individu affecté de cette maladie. Enfin l'hydrophobie rabiforme peut-être causée par une grande frayeur qui n'a aucun rapport avec aucune espece de rage. J'en ai vu un exemple frappant dans le service de M. Louis à la Pitié, chez une jeune fille qui conduisant une charrette avait failli écraser un enfant. Tous les symptoms de la rage se manifestèrent peu de jours après cette emotion vive." He assigns to it a period of incubation, sometimes of hours, sometimes of years, when it cannot be reasonably attributed to virus, but to the influence of the imagination. For further particulars see Valleix. In the face of such an authoritative statement, I think we may fairly assume the existence of a condition analagous to that of pure rabies, which a patient either simulates or, in spite of his own free will, imitates. Criticism is easy, and animadversions have been passed on the treatment of cases reported in medical journals, particularly about showing water and exciting the paroxysms. There is an axiom, attributed to Trousseau, that the physician is justified "in boldly trying everything in presence of a malady which constantly terminates in death." But there is another important and excellent maxim laid down by another Frenchman, Vidal :—"Que le nom de cette maladie ne soit jamais prononcée devant celui qui a été mordu par un chien que tout ce qui rappelle cette malheureuse circonstance, soit éloigné de son esprit." The treatment is certainly unsatisfactory at present; but I have sufficient faith in my profession to look forward to the time when its pathology and real nature will be better understood, and when we will be able to wipe out from our medical works the grim truths stated by Romberg in his "Nervous Diseases" (vol. ii., p. 151)—"That the therapeutic measures hitherto adopted have only proved 'meditationes mortis.'"

Yours faithfully,

T. M. O.

August 29th, 1877.

PROFESSOR GAIRDNER AND MEDICAL REFORM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I have only to-day seen your leading article of August 22nd, in which you attribute to me (on grounds which I will not discuss further than to say that the imputation contained in them is most unfair) some support supposed to the motion of Mr. Ernest Hart as to the amendment of the 40th clause of the Medical Act. Now, as a matter of fact, I did *not* support the motion in question, nor do I approve of it. It may be that, not placing a distinct issue before the meeting, I was misunderstood by others as well as you, for I am not much of a politician, and there was no time

either for business or speeches. But my desire was to support the Medical Reform Committee in their endeavours to get the profession, as such, represented in the Medical Council, while at the same time intimating my entire dissent from the schemes of compulsory conjoint examination embodied in the so-called "Bill of the British Medical Association," and referred to in the Report of the Committee.

I am, &c, &c.,

W. T. GAIRDNER, M.D., F.R.C.P.

Glasgow, Aug. 30, 1877.

THE HOMŒOPATHIC SCHISM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The letter which appears in your last impression, from Dr. Bayes, seems to me so odd a mixture of assertion, bad logic, and nonsense, that I trust you will permit me briefly to reply.

Dr. Bayes says that the adoption of a new theory or practice does not constitute a man a sectarian. This is true, but on the other hand, those who, like Hahnemann, assert that the law of similars is the *only* law of healing, and the infinitesimal the only true dose, and who denounce all who refuse to believe this, are schismatics and intolerant sectarians.

Further, most of the leaders in the body have considered Dr. Bayes' "*Homœopathic* School" as a manifestation of sectarianism. This movement has kept Dr. Bayes in *hot water* for the last six months and, this atmosphere may possibly have suggested to his mind the odd jumble he makes about sailing vessels and *steam*-boats and their respective captains, who, apparently to his satisfaction, refuse to aid each other!

Dr. Bayes says, "medical progress demands liberty of action *in all things*," and yet he says "he both claims and *avoids* liberty of action in consultations." These two sentences seem to me to refute each other, if, indeed, the expression "*avoid* liberty of action" can, as here used, mean anything.

Dr. Bayes' P.S. reminds one of the proverbial postscript of the inconsequent young lady. It contains nine lines and three mis-statements. He says—

1. The British Homœopathic Society declined to take any notice of Dr. Wyld's letter to Dr. Richardson.

2. The majority of the society did not deem Dr. Wyld's letter of sufficient importance to demand any public notice.

3. So strongly did the society disapprove of Dr. Wyld's unauthorised letter that it did not (as usual) re-elect him its vice-president. This was equivalent to a vote of censure.

What are the facts?

1. The British Homœopathic Society thought my letter so important that it devoted two nights to its discussion.

2. Dr. Bayes considered my letter so important that he desired to publish a manifesto thereon in the *Times*, but the society, by a vote of 17 to 10 declared, in opposition to Dr. Bayes and his clique, that "It was inopportune to publish any manifesto of opinion" (as a qualification to my letter in the *Times* and *Lancet*).

3. The vice-presidents of the British Homœopathic Society are elected for one year. I served that time to the best of my ability, read the annual presidential address, and retired with a vote of thanks from the Society.

So strongly was Dr. Bayes offended by the vote of the Society in opposition to the sectarian views of himself and his clique that he and his lieutenant sent in formal letters resigning all future participation in the private business of the Society, while others threatened to retire from the Society, to break it up, and to re-form a *purely homœopathic society!* Dr. Bayes also abstained from attending my presidential address!

Yours faithfully,

GEORGE WYLD, M.D.

12 Great Cumberland Place, Hyde Park, W.

[We have fairly opened our columns to this question. We entertained the proposition of union without prejudice, and have given space to the leaders of both parties, but at the very onset we expressed our grave doubts as to whether Dr. Wyld's scheme would be received by those who practiced homœopathy, or whether he had authority to act on their behalf. Dr. Wyld may still go on in his laudable endeavour to bring about a union, but we feel certain it will only end in failure. He may secure the adhesion of a few like Dr. Rabagliati, of Bradford, &c., but the general bulk of medical practitioners will stand aloof. If Dr. Wyld is anxious to become absorbed in the ranks of legitimate medicine he can do so very easily, as many others have done before him, and this he can do without any recantation or without any loss of pride or self-humiliation. We believe Charles Philips was a homœopath in Manchester before he came to London; many others have passed over quietly into our circle without doing penance in the medical journals. We must now close this correspondence, reserving for Dr. Bayes the right to reply to the above if he wishes.—ED. M. P. & C.]

A COUNTY MEDICAL CLUB.

AN interesting experiment is about to be tried in Suffolk. The *Times* reports the formation of a new Medical Club. Within a year and a half 4,000 of the labouring class have joined the Medical Club, almost without solicitation, rather than rely on gratuitous advice or the parish doctor. It is now proposed to extend the operations of the Club to the whole of Suffolk. The benefits are restricted to persons "whose earnings do not exceed 20s. a week, or maid-servants whose wages do not exceed £8 a year;" thus restricting the Club mainly to agricultural labourers. The payment for a man or woman is 5s. a year; for a man and his wife, 9s.; and for each child 1s., with a *maximum* payment of 5s. for children no matter how large the family. A member of any Benefit Club may claim an abatement of 4s. from these rates. Women in their confinements will be attended for 10s.; the remaining fees payable to a medical man being supplemented by the honorary fund. Members have a choice of doctors living within a specified distance, who have agreed to work with the Club, and most of the principal doctors in the county have consented to the scale of fees embodied in the rules and certified by the registrar. The Club is to be managed by stewards chosen in each parish to receive the payments of members; and these stewards will communicate, through a secretary appointed in every union district, with the central organisation at Ipswich. Small meetings will be held in the towns and villages throughout the country to explain the rules. The Club will be self-supporting, except as to cost of management, surgical provision for accidents, and extra payments for confinements. Thus honorary members are necessary; but with a wide field for appeal, and an excellent object in view, this will probably present no great difficulty. At the request of the Provisional Committee that has been formed, Sir Edward Kerrison has drawn up a statement in which he thus explains the work it is proposed to do:

"The object of this Club is to enable benefit members to provide themselves and their families with medical attendance and medicine during sickness. Benefit clubs provide medical attendance for men only, but it is well known that women and children are more liable to illness than men. This Club is intended to remedy this omission, and not in any way to interfere with established benefit societies. The first stepping-stone to pauperism is an application for the doctor. It is now not so often granted by boards of guardians as it used to be, but when it is granted, in nine cases out of ten, meat and porter or wine are ordered by the medical man, and the rates are burdened not only with the ordinary maintenance of the families, but with the extras which the doctor considers right to order, and thus one family after another become paupers. It is not to be wondered at that an honest labouring man should seek to obtain the services of a doctor free of cost, when his wages will not enable him to pay a doctor's bill. It can only be by numbers collected together in a club of this description, that the charges made by medical men can be brought within the means of the people. It is not an unusual thing for operations or fractures to cost from three to five guineas, a sum which no poor man is able to pay. By belonging to this Club, such

payments will be avoided, and a man can look with certainty to the fact, that however large his family, all ordinary doctor's expenses, except for confinements, will never exceed 14s. a year."

This Medical Club, when started, will be the first county club of the kind in existence, and its working in the almost purely agricultural districts of Suffolk will be watched with interest. Too many families of the labourers in rural districts in the Eastern Counties, as elsewhere in the South of England, are disposed to accept Poor-law relief, especially when it takes the form of medical aid, as a matter of course, without feeling that they are sacrificing much independence or that much effort is required from them to help themselves.

DEATH OF THE TREASURER OF ST. THOMAS'S HOSPITAL.

It is with sincere regret that we have to announce the sudden death of Sir Francis Hicks, who has for many years past acted as Treasurer to St. Thomas's Hospital. Deceased was staying at the time of the melancholy event at the Cliftonville Hotel, Margate, and his sudden death will cast a gloom over medical circles in which he was so well known and honoured, alike for his humanity, liberality, and great interest in the work of medical charity, especially as connected with St. Thomas's, for the welfare of which he never seemed tired of working. Sir Francis was a magistrate for Surrey, and a commissioner of lieutenancy for London. He was knighted on the occasion of the opening of the new buildings of St. Thomas's Hospital, 1871.

The Carrageen Crop.

A recent number of the *Scientific American* gives the following information concerning *Chondrus crispus*, incorrectly called in that journal Carrageen. This production, familiarly spoken of as Irish moss, is known chiefly as the basis of a pleasant and wholesome drink for the sick room, or as an article of use in the preparation of delicacies for the table. Comparatively few are aware of its wide and varied uses in the arts, or that the thousands of barrels of it employed annually by our manufacturers of paper, cloth, felt, and straw hats, &c., and by brewers, is not an Irish, but an American product, and, speaking strictly, is not a moss, but a seaweed. Carrageen is to be found more or less abundantly all along the northern coast of America, ranging between the low water line and the depth of forty feet or so; but as a rule its fronds, which correspond to the leaves of air plants, are so numerously inhabited by small mollusca that they are spoiled for other use. The clean-growing article seems to be limited almost wholly to certain ledges in the neighbourhood of Scituate, Mass.

The harvest begins in May and ends about the first of September. The gathering is made in two ways—by hand-picking during exceptionally low tides, and by means of long-handled iron-toothed rakes at ordinary tides. Of course the work can be carried on only during fair weather. Hand-pulling is possible only during the bi-monthly periods of spring tides, that is, when the moon is full and again at new moon. At such times high tide occurs about midday and midnight, and the ledges are exposed for moss gathering morning and evening.

As the tide rises the pickers are driven to their boats, and proceed to the outer moss-bearing rocks, where the rake is used, as it also is during ordinary low tides. Moss taken in this way is not so clean as the hand-picked, and is always mixed with tape grass, which must be removed during the process of curing and packing.

The curing of the moss is the most critical part of this peculiar farming. On being brought to the shore the moss is black and unsightly; it must be bleached as well as dried. The bleaching is effected by repeating wetting and drying in the sun; and as the moss is readily soluble in fresh water the bleaching beds are situated near the banks of the salt creeks that abound along the shore.

The crop averages about half a million pounds a year; and thanks to the brighter and more abundant sunshine of the American coast, the moss has a brighter colour and is of finer quality than the Irish product.

ROYAL COLLEGE OF SURGEONS.

The following report shows the number of candidates who who have passed and have been rejected from each medical school during the years 1876-77.

PRIMARY EXAMINATIONS.

1876-77.

Medical School.	Totals.	Number passed.	Number rejected.
St. Bartholomew's	119	82·50	36·58
University College	100·50	69	31·50

Note.—In these respective lists candidates who are indicated by a fraction have received their education at more than one school of medicine.

NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in London, Dublin, or Edinburgh.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

BLOOD-LETTING.—Byron had a prejudice against blood-letting. It is said his life would have been saved if he had consented to it. There was a *post-mortem* examination made, the notes were published in the *Gazette de Sante*, Aug. 25. 1824.

HOSPITALISM, Manchester.—The pavilion system is no doubt the best. The Hotel-Dieu, Paris, is now opened for patients; it is supposed to be constructed on the newest principles, and you might learn some practical hints by a visit to it, and to the other Paris hospitals, as the Lariboisière.

DR. A.—The present university at Durham was established in 1831, opened October, 1838, and chartered June, 1837. There was a college founded in 1290, abolished at the Reformation, and Cromwell established a college in 1657, which was suppressed at the Restoration 1660. The School of Medicine is at Newcastle-on-Tyne.

RED CROSS.—The National Society for Aid to the Sick and Wounded was founded August 4, 1870, and is in communication with the International Society at Geneva. There should be plenty of work at the present time in attending on the unfortunate wounded in the present war. Write to the Secretary or Colonel Loyd-Lindsay.

FEES FOR VACCINATION PROSECUTIONS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Would you be so kind as to let me know if I am entitled to a fee when the Board of Guardians notice me to attend five miles away at the court to prosecute a man for the non-vaccination of his child. I must state I am not registrar in my district and would think his presence at the court should be sufficient

Yours,

ORIEL.

[Our correspondent is certainly entitled to his fee, there being nothing in any Act of Parliament or in the Dispensary Regulations to make the giving of evidence part of the duty included within his salary. The fact of his being registrar would not alter his position in the least. If summoned by subpœna he *must* attend, but, if not certain of his fee, should appeal to the bench for an order for it.—ED. M. P. & C.]

MR. LUNN.—We would strongly advise the opposite course.

PATER will find all he requires in our Students' Number for 1876 should he require the information before the appearance of our next on the 19th inst.

MR. L. O. R.—The correspondence was stopped three weeks since; we can insert no more letters on the subject.

MR. BOOTH.—The instrument referred to is of French origin and make; we have not yet seen it this side of the channel, but will cause inquiries to be made at some of the principal instrument makers and inform you in our next if it can be had here.

DR. STRETCH DOWSE, "On Syphilis as Affecting the Nervous System."—Dr. Seaton Reid, of Belfast, writes to disclaim the honour ascribed to him by Dr. Dowse in our last issue as being "the first of our countrymen to draw attention to syphilitic diseases of the nervous system." Our correspondent says: "I believe the statement by Dr. Dowse *to be true* except as to the spelling of the name. There were two Dr. Reids in Belfast, one, Dr. Thomas *Reade*, who died a few years ago, and was the discoverer alluded to; the other myself, whose name, you will observe, is differently spelled from his. The honour, therefore is not mine."

BOOKS, PAMPHLETS, AND MEDICAL JOURNALS RECEIVED.

The Morphology of the Skull. By W. K. Parker, F.R.S., and G. T. Bettamy, M.A. London: Macmillan and Co.

Fleischcher's System of Volumetric Analysis. Translated by M. M. Pattison Muir, F.R.S. London: Macmillan and Co.

Unsectarianism and Toleration in Medicine. By George Wyld, M.D. London: Trübner and Co.

The Spas of Aix-le-Bains. By F. Bertier, M.D. London: J. and A. Churchill.

Asen, the Man-hater. By Oliver Goldsmith. With Editorial Introduction. London: Griffiths and Farran.

VACANCIES.

Alcester Union.—Medical Officer to the Inkherron District. Salary, £60, exclusive of fees. Address the Clerk to the Guardians.

Baltinglass Union, Rathvilly Dispensary.—Medical Officer. Salary, £120. Election, 24th inst.

Bristol General Hospital.—Physician's Assistant. Salary, £50, with board, &c. Applications to the Secretary by the 21st inst.

Edinburgh University.—Examiner in Chemistry. Applications for the appointment to be lodged before October 1st with the Secretary.

Holbeach Union, Lincolnshire.—Medical Officer to the Luton and Tydd Districts. Combined salaries, £62 10s. Applications to the Clerk of the Union.

Nantwich Union, Cheshire.—Medical Officer of the Wybunbury District. Salary, £3[illegible], exclusive of fees. Applications to the Clerk of the Union.

Northumberland County Lunatic Asylum, Morpeth.—Assistant Medical Officer. Salary, £100, with board, &c. Apply to the Medical Superintendent by the 13th inst.

Parsonstown Union, Ferbane Dispensary.—Medical Officer. Salary, £120. Election, 20th inst.

St. Mary's Hospital, Paddington.—Pathologist and Medical Tutor. Salary, £100. Full particulars of the Dean. Latest day, 24th inst.

Westminster Hospital.—House Surgeon, and an Obstetric Assistant. Board and lodging provided, but no salary. Address the Secretary by the 15th inst.

Westport Union, Louisburgh Dispensary.—Medical Officer. Salary, £100. Election, 10th inst.

APPOINTMENTS.

BUDDS, W. T., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Extraordinary Physician to the Cork Fever Hospital and House of Recovery.

COOKSON, A. N., M.R.C.S.E., Medical Officer and Public Vaccinator for the Chilvers-Coton District of the Nuneaton Union.

EATON, J. C., M.R.C.S.E., Medical Officer for the Ancaster District of the Grantham Union.

ELLIOT, J., M.R.C.S.E., Medical Officer and Public Vaccinator for the newly-formed No. 3 or Bodenham District of the Leominster Union.

GOWING, B. C., M.R.C.S.E., a Medical Officer to the Salisbury Medical Club and Provident Dispensary.

GROWSE, J. L., M.R.C.S.E. & L.M., Medical Officer and Public Vaccinator for the Bildeston District and the Workhouse of the Cosford Union, Suffolk.

HIGHET, J., M.B., C.M., a Surgeon to the Workington Dispensary.

KENNY, R. J. D., L.R.C.S.I., a Medical Officer to the North Dublin Union Workhouse.

MACKAY, A., M.B., C.M., Medical Officer and Public Vaccinator for the Parish of Lismore and Appin, Argyleshire.

MURDOCH, W., M.B., C.M., Assistant Medical Officer to the Perth District Lunatic Asylum, Murthly.

OLDMAN, J., M.R.C.S.E., Medical Officer of Health for the Huntingdon Urban Sanitary District.

Marriages.

FORMAN—JOHNSON.—Sept. 1, at St. Mary's, Hornsey, N., G. Ellery Forman, Surgeon, R.N., to Alice, eldest daughter of W. W. Johnson, of Hornsey Rise.

KEEGAN—STERN.—At the Church of St. Othmar, Vienna, Denis F. Keegan, M.D., Indian Medical Service, to Francisca M., fourth daughter of the late Herr Herman Stern, of Vienna.

RAVENHILL—CUTLER.—Aug. 29, at Hall Green, Thomas Holmes Ravenhill, M.R.C.S., &c., of Bordesley, Birmingham, to Adelaide Anne, second daughter of the late John Walford Cutler, Solicitor, of Birmingham.

Deaths.

BURKE.—On Aug. 17, at Octagon House, Westport, Francis Burke, L.A.H.D., aged 82.

BURKITT.—On Aug. 23, at Wicklow, William Robert Burkitt, L.R.C.S.I., Surgeon Major, late of the 52nd Regiment

DAVIDSON.—On Aug. 26, at Bogie House, Kirkcaldy, William Gordon Davidson, late Inspector-General, Indian Army, Madras.

DURRAN.—On Aug. 16, at Fulham, David Durran, M.D., aged 66.

LLOYD.—On Aug. 18, at Carmarthen, William Lloyd, M.B., aged 30.

NESS.—On Aug. 18, at Plymouth, John Ness, F.R.C.S.E., of Helmsley, Yorkshire.

O'DONNELL.—On Aug. 20, at Waterloo, Liverpool, John O'Donnell, M.D., aged 77.

SKRIMSHIRE.—On Aug. 17, at Holt, Norfolk, George Skrimpshire, M.R.C.S.E., aged 75.

WILLOWS.—On Aug. 21, at Oakfield Road, Penge, Robert G. Edward Willows, M.R.C.S.E., late of Chesterton, Staffordshire, aged 28.

ACCIDENTS OF ALL KINDS
Insured against by the
NORWICH AND LONDON
ACCIDENT INSURANCE ASSOCIATION.
Established 1856.
SUBSCRIBED CAPITAL £100,000.
£1,000 at Death, £6 per Week when Disabled. Annual Premium, £3 to £5 5s.
CHARLES R. GILMAN, *Secretary.*
Chief Offices, NORWICH: London Office, 30 Moorgate Street.

ACCIDENTS BY FLOOD AND FIELD.
ACCIDENTS OF ALL KINDS
May be provided against by a Policy of the
Railway Passengers' Assurance Company,
The Oldest and Largest Accidental Assurance Company.
HON. A. KINNAIRD, M.P., Chairman.
SUBSCRIBED CAPITAL, £1,000,000. ANNUAL INCOME, £205,000.
£1,120,000 have been paid as Compensation.
A fixed sum in case of Death by Accident, and a Weekly Allowance in the event of Injury, may be secured at moderate Premiums.
Bonus allowed to Insurers of five years' standing.
Apply to the Clerks at the Railway Stations, the Local Agents, or 64 CORNHILL, LONDON.

THE HARVEIAN ORATION—1877.

DELIVERED BEFORE

THE ROYAL COLLEGE OF PHYSICIANS.

By Edward H. Sieveking, M.D., F.R.C.P.,

Physician-Extraordinary to the Queen; Physician-in Ordinary to the Prince of Wales; Physician to St. Mary's and the Lock Hospitals, &c.

Every detail concerning Harvey's early studies appears to command our interest; I, therefore, make no apology for presenting you with a few details concerning his first lectures. The volume, which is carefully bound in leather, with some pretensions to elegance, contains about 99 pages of foolscap paper, reduced to a size of 6 inches by 8. The binding was evidently an after-thought, and the loose pages may have been used for one or more years before they were put into their present form, because they bear the marks of having been folded lengthways twice over, so as then to occupy a very small space of about 8 inches by 2. There is also evidence that Harvey used the book in its present form for his lectures; for he had attached by sealing wax, threads of twine along the inner side of the cover, under which he could slip any further notes for future lectures. The writing throughout appears to have suffered little or nothing in distinctness, except that of the title-page; but in evidence of the style and the difficulty of putting it into a modern form, I venture to send round an autotype copy of one of the most legible passages, which happens to be the *resumé* of what Harvey taught in his early lectures regarding the heart and circulation.

The title-page, which is in red ink, is very nearly illegible. It is to the following effect: "Prelectiones anatomiæ universalis, per me Guglielmum Harveium Londonensem, anatom. et chirurg. Professorem. Anno Dom. 1616. Anno ætatis 37. Prælect. April 1st, 1517." Underneath are the numbers 16, 17, 18, which probably imply that these particular notes were used for the lectures of 1616, 1617, and 1618.

The manuscript evidently consists of mere memoranda: jottings of the subject upon which the speaker could dilate as he chose. Each full page contains about thirty lines, and but few of the words are written out in full. The abbreviations, which sometimes assume an almost hieroglyphic form, are very numerous; and as the terminations of the words are commonly mere up and down strokes, a considerable latitude must necessarily be allowed to the transcriber. Under these circumstances, and from the impossibility of interpreting or verifying some of the allusions and references, the transcript and translation of the portion that particularly concerns us, relating to the heart and circulation, inevitably leaves much to be desired (*a*). I may say that this section occupies a little more than 15 pages of the volume, comprising altogether 441 lines.

The notes are put together in an aphoristic manner, and are occasionally interpolated with English words for which the writer, at the moment of composition, was unable at once to supply the corresponding Latin term. There are frequent references to other authors; Hippocrates, Galen, Columbus, Vesalius (*sic*), Colsius, Aquapendens, and one, though this is doubtful, to Cæsalpinus. Every now and then we meet with initials W. H., appended, probably, for the purpose of distinguishing the passage as one that the speaker wished to mark as belonging especially to himself. The notes show that Harvey had, at that time, already studied the subject by vivisection, and that he had employed a variety of animals for his inquiry. But one feels throughout that he is still somewhat influenced by the prevailing views, and that he

(*a*) The attempt I have made in translating it has not yielded satisfactory results; and, after submitting it to more competent Latin scholars than I profess to be, I fear others would not be much more successful. It would probably be wisest to publish the notes in autotype, with an accompanying transcript, and allow each reader to be his own interpreter.

is only laboriously attaining that clear insight which his work, published in 1628, so plainly shows.

Harvey commences the section on the heart and circulation with an etymological assertion, for which, I fear, it would be difficult to find sufficient justification : *Cor a currendo, quia semper movetur.* His first anatomical statement is to this effect (*a*). "This (the heart) is the chiefest of all parts of the body, not by any inherent quality, for its flesh is more fibrous and harder and colder than the liver, but by the quantity of blood and spirits contained in the ventricles." You see, he still clung to the view that the heart contained something besides blood. The heart, he says, cannot bear any serious lesion without death ensuing; still, he adds, showing that he had already devoted attention to pathological anatomy, *vix ullis vitium cadaveribus vidi, nec consumitur ptysi (phthisi) secundum spem Galeni.* An amusing instance of a jumble of Latin and English occurs in this section : *Exempto corde frogg scipp, eel crawle, dogg ambulat ;* in which the English, not one word of which would pass muster at a spelling-bee, is as interesting a feature as the physiological fact embodied in the sentence.

The next section is devoted to an examination of the structure of the heart and its contents. Harvey's initials are attached to such sentences as—*Hinc cur potius arteria oriri a corde quam vena, non video ;* as—*Quære de principio venarum, puto a corde.* He commences the consideration of the use of the heart with the statement—*Hæ duo lacunæ* (the two ventricles) *cysternæ sanguinis et spiritus ;* the latter, he subsequently says—*in totum corpus hinc distribuitur.* Much comparative anatomy is introduced ; and we meet, probably for the first time in English medical literature, the designation of "bishop's miter" as applied to the left auriculo-ventricular valve. Harvey heads the next division of his subject *Historia, Transitus Sanguinis et quomodo spiritus fiat.* In this, he discusses the question of the transmission of the blood through the foramen ovale, which he regards as a fœtal arrangement, describing at the same time the changes occurring in the ductus Botalli. The substance, colour, and temperature of the heart are considered ; and here, as elsewhere, there are suggestions manifestly derived from clinical practice. Under the heading *Motus*, Harvey dwells upon difficulties, which he subsequently surmounted, in understanding the movements of the organ, and especially in determining which was systole and which diastole (*b*). He evidently took his audience into counsel and displayed before them the living heart, for he says (*c*) : "I have watched the process for entire hours, and was unable to determine the question for myself, either by sight or by touch ; therefore, I shall ask you to look for yourselves, and give me your opinion." However, he arrives at this conclusion, that, whether the erection of the heart is to be regarded as the act of systole or diastole, the heart, by its erection, projects the blood and causes the pulse (*d*).

One more extract, and I will detain you no longer with the notes ; hoping, however, that I have not taken up your time unprofitably with a subject that appears to me to justify our liveliest interest, and to merit a more complete and permanent record than my present opportunity permits.

The passage that I am about to quote forms the peroration to the first Lumleian Lectures on the heart, and comprises a summary of the doctrines on the movement of the heart and the circulation as taught by Harvey at the beginning of his career. I shall give the passage verbatim, prefacing it only with the remark that it is initialled W. H.

Constat per fabricum cordis, sanguinem per pulmonis in aortam perpetuo transferi ; as by two clacks of a water-bellow to rayse water.

Constat per ligaturam transitus sanguinus ab arteris ad venas.

Unde Δ (*demonstratur*) *perpetuum sanguinis mortum peri pulsu cordis*)

An (*?*) *hoc gratiæ nutritionis, an magis conservationis sanguinis et membrorum per infususionem calidem, vicissimque sanguis calefaciens membra, frigifactus, a corde calefit.*

Most of this is taught more explicitly in Harvey's work of 1628 ; but he then, as shown in his letter to Riolan, abandoned the theory that the heart was the source of heat.

I owe you, Sir, and Fellows of the College, an apology for having occupied so much of the brief time at my disposal by the inquiry into the merits of Cesalpino (*a*) but it appears to me one of the duties of the Harveian orator not to allow (as far as in him lies) an aspersion to rest on a name that has been justly called "immortal." Our departed friend, Emanuel Alexander Parkes, in fervent language, vindicated Harvey's claim to that title, in the posthumous oration which Sir William Jenner read from this chair last year. He spoke of Harvey's discovery as one "that is not only one of those cardinal discoveries which lie at the very foundation of physiology and medi-

(*a*) Principalissima omnium pars, non propria ratione, carne fibrosior enim et durior et frigi*dior* hepate, sed copiæ sanguinis et spirituum in ventri*culis*. Harvey enlarges upon this paragraph under three heads. 1. Unde fons totius caloris ; 2. Unde auricula dextra pro aposte*mate* cernetur morte ; 3. Unde piscis quasi lacuna san*guinis*, et eo major quo sanguis spirituosior, calidor ; puto quo disten*tius* et non concre*tum* possibi*le* ad vitam, unde auriculæ pulsant post emo*tum* cor san*guinis* multitu*dine*. The italicised letters are the terminations suggested by Mr. Bond.

(*b*) Videtur quod arduum et difficile discernere aut visu aut tactu, dilatari et constringi, et qualis sit systole qualis diastole.

(*c*) Ego per integras horas animadvertendo non facile potui discernere neque visu neque tactu, quare vobis cernendum et indicandum proponam.

(*d*) Erectione protendit sanguinem et facit pulsus, pro eresi (an heretical notion) et contra Galenum—"as in a glove," he adds in English, and concludes : Hinc pulsus arteriarum, non ex inmata facultate sed protendente corde.

(*a*) Cesalpino's inquiries into demonology, have no bearing upon the subject matter of the oration : but I venture to direct the reader's attention to them, as they are often extremely amusing and may assist in forming some opinion of the writer's character and frame of mind. As a whet to their appetites, I extract the following illustration from the "Dæmonum Investigatio" (chap. ix, p. 154), of the views that prevailed even among the educated classes in the sixteenth century as to the influence exerted by evil spirits upon man. Cesalpino relates that "A ship having put into Salamis, in the island of Cyrus, for the purpose of purchasing provisions, a young man left the vessel and bought some eggs of a certain women. He ate them on the shore, and after the lapse of an hour, lost his voice and became half stupefied. When he essayed to go on board, he was driven back by his associates, who did not recognise him, but regarded him as an ass. As the wretched man was unable to express himself in words, the ship quitted the harbour without him ; and he, anxious and having nobody to advise him, returned to the woman by whose influence he suspected that he was detained. He obtained no help from her ; and therefore, waiting his opportunity, remained three years in the country, occasionally carrying burdens, according to the custom of asses. At night he stayed with the woman ; but continuing dumb, was unable to give evidence against the poisoner. However, having been accidentally led to the town, and passing a church, the ass was seen by certain Genoese merchants, at the elevation of the host, which happened at the moment to be raised, to bend his hind legs and to raise his forepaws in adoration. The merchants seeing this miracle, inferred that the woman who was leading the ass was a witch (for this species of transformation was common in Asia). They brought the affair to the notice of the mayor of the town, who ordered the woman to be seized. She confessed her crime, and in the hope of pardon, restored the young man to his former condition, and he returned home. She, however, suffered condign punishment. Cesalpino adopts this tale as a fact, and infers that such occurrences prove that the accounts given by poets of the metamorphoses of the companions of Ulysses into animals by Circe were not mere fables. It is not difficult to conceive how the sober mind of Harvey would treat these lucubrations of Cesalpino if he were acquainted with them ; but they scarcely impress us with the conviction that the latter was a man capable of effecting a great revolution in science. It may be interesting to modern demonologists to know that a picture by Gius. Sabatelli—painted in the present century—is to be found in a chapel of Santa Croce in Florence, in which a mule is represented as kneeling before the host which is being conveyed to a sick person (see "Museo di Pittura e Scultura, Firenze, 1842. Tavola 1182).

cine, but is one that from its very nature forms one of those great landmarks which must remain in the sight of all." Upon that topic it is unnecessary for me to dilate before an audience in whose ears the words of Parkes still ring. But it may not be unfitting to inquire whether we, the spiritual descendants of Harvey, are carrying on the great tradition which we have received from him in a manner that he would approve of—by a steady pursuit of truth for its own sake, by that rigid sobriety of judgment which everywhere characterised his researches, by that "marvellous industry" and "insatiable curiosity" with which he prosecuted his researches to the day of his death.

Our Hunters, our Marshall Halls, our Bells, our Brodies, all trod in Harvey's path, and have largely aided in the onward movement of medical science in this country; but I think I do not indulge in a vain "Eidolon," if I look upon the present period of British medicine as one to which pre-eminently the term of the Harveian age of medicine may be justly applied. The future only can determine the meed of praise to be awarded to an individual, and will not fail to correct any exaggerated estimate which a contemporary may form. But as it is one of the functions of the Harveian orator to speak "in commemoration of those who have added aught to the sum of medical science in the course of the bygone year," I believe myself to be only fulfilling the trust confided in me if I dwell upon the earnest work which we see on all sides, and which, in spite of malevolence and misconstruction, is leading us on step by step to more perfect knowledge, and enabling us more and more to benefit our fellow-men.

Two of our distinguished contemporaries of this College I have already named—one, alas! no more—whose names will shed lustre upon the present time. But there are many both in and out of this College whom this country may be proud of, and whom we cannot but think that Harvey would gladly have extended the right hand of fellowship to, and have recognised as fellow-labourers. Scientific medicine of the present cannot fail to command the grateful acknowledgments of our descendants with such an array of names as Billing and Watson, Burrows, Williams, Carpenter, Sharpey, Beale, Paget, Bennett, Simon, Radcliffe, West, Sanderson, Johnson, Brown-Séquard, Lockhart, Clarke, Murchison, Handfield Jones, Richardson, Garrod, Wilks, Pavy, Dickinson, Harley, Hughlings Jackson, Hutchinson, Bastian, Ferrier, and many others, whose researches have already secured them a renown that nothing my feeble voice might urge can either abate or increase.

Would not Harvey have rejoiced to learn the revelations of the microscope and of the chemical laboratory, which belong especially to our day? Can we not picture to ourselves the flash of joy that would beam from his black eyes as he traced the intricacies of cardiac action and of respiration with the stethoscope, the sphygmograph, and the cardiograph? Would it not have gladdened his heart to see the admirable reports of the Medical Officer of the Privy Council spreading light over recondite processes, and illuminating subjects not less interesting to the man of science than fraught with benefits to the human race? Would Harvey not have followed with profound intelligence and animation the discussions in our societies on the causes and pathology of cancer, on the communicability and production of tubercle, and the intricate question of syphilitic infection?

Who can study the researches of Dr. Sanderson into the pathology of infective processes without feeling that he is leading us to a profounder study of the most hidden phenonema of disease than was thought attainable a very short time ago? Mr. Simon (*a*) alluding to his work and that of his colleagues, says well that their studies are extremely important, and that ordinary professional practice supplies neither opportunity nor immediate stimulus for them; studies of elaborate and purely scientific research in aid of the development of medical knowledge, studies never immediately convertible to pecuniary profit, but perhaps, on the contrary, involving heavy cost; studies, too, which, from their nature, cannot promise rapid results, nor be conducted in fragments of leisure, but require systematic and continuous labour extending over long periods of time.

Dr. Sanderson's researches have especially served to open out a new vista with regard to many inflammatory and febrile processes; and although they are not to be regarded as concluded, they have already shed much light, particularly on the origin and course of infective processes. We owe to his earlier experiments the discovery of the fact "that when in the lower animals local inflammations are produced, either in the skin or peritoneum, by the introduction of irritant substances, two distinct sets of consequences manifest themselves, viz., a chronic disease exhibiting in all respects the anatomical characters of tuberculosis, and consisting essentially in the overgrowth of certain tissues, designated as lymphatic or adenoid, and shown to be in close relation with the lymphatic system; and (2) an acute disease presenting the leading features of pyæmia, attended with the formation of metastatic abscesses, and as a rule, terminating fatally and very rapidly by the formation of infective abscesses and nodules associated with inflammation, not only of the peritoneum, but of other serous cavities."

It is no small matter to have learnt from Dr. Sanderson's inquiries into the pathology of diphtheria, that microzymes and micrococci exist which possess the power of colonising in living tissues, and "thereby inducing a variety of inflammation which is distinguished from others by its tendency to result in disintegration, and that this faculty of disintegrative inflammation is possessed by them independently, and can be exercised without the concurrence of any previously existing morbid process. The micrococci found by Sanderson, by Keber, Cohn, and others in small-pox, the rod-like bodies, distinct from bacteria, belonging to splenic fever, the wavy spirilla discovered by Obermeier in the blood of persons suffering from relapsing fever, and not seen in other acute and infective disease—all point to the necessity of remodelling many of our views regarding the essence of disease; while a more intimate knowledge of its pathology cannot fail to give greater precision to our methods of combatting morbid processes.

We cannot hope to apply a more scientific treatment to disease than we do now, until we thoroughly understand the origin and course of the disease, and the changes that occur. Although it is manifest that morbid poisons do not all act equally upon man and animals, still, it is also clear that we must be content to study the synthesis of disease, with very rare exceptions, in the brute creation only. Would that it were possible to popularise such researches as those initiated by the Medical Officer of the Privy Council, in order to convince a sentimental public that they open a prospect of hopeful harvest in the field of preventive and curative medicine! Surely, it is as much in accordance with the dictates of the most refined humanity to utilise animals for the extension of knowledge that shall afford relief or immunity from disease, as to employ them for the sustentation of life as food and raiment. As some of the agitators against scientific advancement are proof against facts and evidence brought forward in the vernacular tongue, (*a*) we may hope that they more readily accept arguments when expressed in the language of Virgil. We would recommend them to read the "Carmen Elegiacum" of Dr. Bridges, (*b*) in which the poet offers an elegant protest against the imputation that heartlessnes and cruelty direct experiments made upon animals. After referring to the good work done by our distinguished Fellow, Dr. Brunton, whom he describes as

(*a*) Report of Medical Officer of Privy Council, 1874.

(*a*) See especially the Report of the Royal Commission on the practice of subjecting animals to experiments for scientific purposes. 1876. Bluebook.

(*b*) Carmen Elegiacum Roberti Bridges, de Nosocomio St. Bartolomæi, Londinensi. Londini: 1877.

"Promptus aberrantes vivisecare canes,"

and, after alluding to the popular errors prevailing on the subject, he exclaims

"Hoc crudele aliquid nobilitatis habet,
Hic simul humanis prodesse inventa videntur;
Quoque loco cecidit rana, resurgit homo."

Assuming that we have acquired a power to recognise the germs giving rise to febrile and infective processses, or of the *causa proxima* (to use an antiquated term) of other morbid conditions, we could not hope to determine satisfactorily by chemical reagents in the test-tube the antidote that would neutralise them. This would merely be an ancillary method, guiding to further researches; the real value of the antidote could not be established in any other way than by experiment upon a living body into which the germs had been introduced. Valuable as are the reports of Dr. Baxter, (*a*) as to the relative disinfecting power of chlorine, permanganate of potash, sulphurous acid, and heat, they deal only with contagia outside the body. We have probably all of us in practice hoped that, by introducing these and similar agents into the diseased body, we might influence beneficially the processes manifestly depending upon such contagia. I fear that as yet no results have been achieved that would in any way justify a belief that the antidote has been discovered, that will neutralise or arrest an infective process in the body, as we have succeeded in doing external to it. Our treatment in these cases, as yet, consists in dealing with the product of the morbific germ, and in assisting Nature to bear its assaults with more or less impunity. The goal that we or our successors must aim at is to discover a germicide agent, whether to be introduced by the mouth or by injection directly into the blood; so that, to use Mr. Simon's words, (*b*) "the bedside practitioner shall be able to apply his counteragents with the precision of one who conducts a mere physical experiment."

But if we are still far from a perfect knowledge of the intimate cause of morbid processes, promising as the investigations are to which allusion has just been made, we have greater reason to congratulate ourselves on our recent advances in the determination of the various phases exhibited during the progress of disease. Few appliances, during the most recent period of medicine, have contributed more to this advance than the thermometer, the universal adoption of which might well be adduced in evidence of that Harveian spirit which I venture to claim as a characteristic and prevailing feature in the medical profession of the present day. Remembering the early days of the stethoscope, and the comparative slowness with which it forced itself into universal recognition, the manner in which the thermometric test of morbid processes has been received in all ranks of the profession, from the time its value was first shown by Wunderlich and Traube, seems to justify a high estimate of the advance made by the students of medicine during the present generation. The thermometer does not give us the reason of the change of temperature in the individual case; but it enables us to form a correct estimate of many processes, the nature of which previously could only be determined in the *post-mortem* room; and increased diligence in its employment is likely to render more clear the diagnosis of various obscure changes, as, for instance, Bastian (*c*) and others have already indicated in the department of cerebral pathology. The thermometer tells us a fact, which the most educated tactile sensibility is inadequate to determine with precision; and both in the outset, course, and convalescence of acute disease, it is an invaluable help to judge of the requirements of our patients. Whether more care in observation, or more refined instruments, will materially increase the value of thermometry, remains to be seen; but what we specially require is a means of determining the commencement of the incubative stage of febrile disease, so that we might be enabled to apply our remedies before the zymotic process has actually poisoned the entire system. The interval that elapses between the absorption of a germ and the actual manifestation of the complicated processes to which it gives rise, is the period during which an antidotal or germicide agent would be most certain to effect the desired end. It suggests itself whether we are not likely to find, in a combination of the galvanometer and thermometer, the means of a further advance in this direction; and it seems to me that we must look to the galvanic test also for a solution of the problem, which is so often presented to the practitioner; how pain, which at present is only a subjective sign, can be rendered more objective; how we may estimate and measure this important system; how we can secure an instrument which, by anticipation, may be termed an odynometer.

The *tactus eruditus*, upon which our predecessors justly laid stress, and which cannot now be dispensed with, is rendered more intelligible and receives a scientific basis in the explanations of the varying conditions of arterial tension afforded by the sphygmograph. It is one of those inventions and applications of the modern physiologist which we conceive that Harvey would have especially delighted in, as giving confirmation to many views which he held, and explaining much that necessarily was beyond even his powers of solution. The sphygmograph affords us the *rationale* of those differences of the pulse which the practised physician has long recognised; and though not suited, at least in its present form, for ordinary bedside practice, has already, in the hands of experienced observers, thrown much light on the changes which the heart and vessels are subjected to in the varying phases of disease. As it has already given precision to our physiological doctrines on the action of the heart, the condition of the arteries, and the balance of the circulation, we may hope that it will aid us still further in determining the action of many substances which affect the circulating apparatus of the blood, concerning which the medical mind is still in a painful state of dubiety.

In connection with this subject, I am confident that I re-echo the feelings of every member of this ancient Corporation if I dwell upon the loss which the College has sustained, since the last Harveian oration was delivered, by the decease of a man whom we may justly designate as a genuine follower of our great medical prototype, and who showed by his work that he also "avowed himself the partisan of truth alone," questioning Nature with all the perseverance of the earnest student, and not content with anything but the most rigid examination of the replies she vouchsafed to his inquiries. Among the numerous works of Harvey, the loss of which we have to deplore, (*a*) "by certain rapacious bands, which, not only with the permission but by the command of Parliament, stripped his house of all its furniture, but abstracted the fruits of many years of toil," we have to reckon a "Medical Anatomy." (*b*) One of the various works by which our friend Dr. Sibson has established a name, which will endure while this College lasts, is a "Medical Anatomy," in which he gives evidence of many of the admirable qualities which characterised Harvey. Like Harvey, too, he did not hurry into a publication of his researches, but thoroughly matured his work before bringing his fruit into the great market of literature. To both we may suitably apply the praise bestowed upon Goldsmith, in a somewhat different sense, in the well-known words: *Nihil tetigitquod non ornait.* (*c*) Sibson's work in connection with respiration, with the

(*b*) "The Works of Harvey," Sydenham Society's edition, p. 89.

(*c*) We hope to be pardoned for taking a slight liberty with Johnston's epitaph on Goldsmith, the commencement of which runs thus: "Oliverii Goldsmith, poetæ, physici, historici, qui nullum feri scribendi genus non tetigit, nullum quod tetigit non ornavit, sive risus essent movendi, sive lachrymæ, affectuum potius et lenis dominator et cet."

nomenclature of disease, with aneurism, and with sanitary science, deserves a grateful record on our part. There appears a special fitness in the fact, that the last time Sibson appeared before the medical public, he delivered two Harveian lectures "On Bright's Disease and its Treatment," in which we find all those qualities of the scientific physician which have left so deep an impression upon the generation in which he lived. They do not, of course, convey to the reader the many estimable qualities of head and heart, the warmth and heartiness of his friendship, the poetic love of nature and of art, which endeared him to all who had the privilege of intimate intercourse with him, and which we rarely see so harmoniously blended as they were in our departed friend. These, indeed, are enshrined in our affectionate memories; but his chief claim to be mentioned in this place, and on this occasion, lies in the fact that those who knew him best may claim for him, in an especial manner, that he was a representative of the Harveian spirit of honest and truthful research into the mysteries of God's work in nature.

(To be continued.)

THE OTOLOGY OF THE LAST TEN YEARS.

By Dr. Guerder,
of Longwy.

Translated from the *Annales des Maladies de l'Oreille, du Larynx et des Organes Connexes.*

By W. Douglas Hemming, M.R.C.S.

In 1866-7 M. Duplay, after remarking on the great impulse which otology had received abroad during the preceding twelve years, deplored the indifference of French physicians to that branch of science. Since that time, while the movement has been still more marked abroad, especially in Germany, serious efforts have been made among ourselves to keep pace with this impulse, the proof of which may be found in the publication of these *Annales* and of numerous theses. But many foreign works are still known only to a few, and it is to extend the knowledge of them and to excite amongst us new researches that I have undertaken this succinct *résumé* of works on otology published during the last ten years. The review will be divided into three parts :—

I.— Anatomy and physiology. II. — Pathology. III.—Therapeutics.

I.—Anatomy and Physiology.

The External Ear.—The anatomy of the external ear has been well known from the time of Troltsch and Toynbee, to whose descriptions recent researches have added nothing of importance. This is not the case, however, with the physiological functions of the auricle. Two diametrically opposite opinions are held on this point : some with Itard deny to the auricle any importance ; others attribute to it functions analogous to those of the tympanum.

Those who deny to the auricle any influence on the auditory faculty, base their opinion on those cases of absence or loss of substance of the appendages without resulting deafness. These cases are somewhat few in number and too incomplete to serve for demonstration. The state of the hearing power had never been tested before the ablation of the auricle, and nothing indicates that, although hearing might remain good, there had not been some diminution in its quality. In some cases it is said hearing power has diminished, but inasmuch as here also the auditory acuteness had not been tested before the loss of substance, this diminution might have been preexistent and due to another cause. On the other hand, admitting even that loss of the auricle does not influence the hearing of a watch or a tuning fork, this does not prove that the auricle possesses no physiological importance. No one denies to the membrana tympani an important part in hearing, and yet all otologists know that grave alterations of this membrane and extensive perforations may coexist with apparently normal hearing power. As Voltolini (*a*) says it is necessary to distinguish in the auditory faculty, in order that the organ may be complete, a qualitative faculty and a quantitative faculty; in a word there are persons who hear sounds well and who do not hear music, that is to say they do not feel it. Generally speaking, children hear better quantitatively than adults, and the latter appreciate better the qualities of sounds. Savages hear feeble sounds at considerable distances which civilised men do not hear, but they have not the musical ear. We cannot judge exactly of the auditory faculty with the very imperfect methods of examination which we at present possess. Some recent works which have sought to establish the functions of the auricle by experimental methods seem sufficiently interesting to merit attention.

The functions attributed to the auricle are :—

1. That it is a resonator and, at the same time, a reflector of the sound waves, which it concentrates into the meatus.

2. That it enables us to distinguish the direction of a sound.

3. That it isolates sounds and transmits them thus isolated to the labyrinth. Kupper (*b*) and Mach (*c*) do not admit that the auricle can reflect any considerable number of the waves which strike it, supposing even with Boerhaave that it produces multiple reflections. In fact, the length of the perceptible sound waves is such that multiple reflections are impossible on a surface so small as that of the auricle ; this is true even when we consider only the waves which directly strike the auricle, for those which come from behind or before are much more disadvantageously situated. Mach has made very conclusive experiments on the mode of reflection of sound waves. If we introduce into a 16-feet organ pipe an obstacle, such as a piece of wood, which does not sensibly modify the lumen, and bring near to this piece of wood a flame, it will be seen that while the pipe sounds the flame oscillates parallel to the surfaces of the piece of wood, following all its contours and all its angles. If the flame be placed near the open extremity of the pipe the sound waves are seen to diverge in all directions and to be bent on the edges of the pipe. These experiments show that the reflections of the sound waves are not produced in the same way as those of the light waves.

Mach admits only that the perception of the direction of a sound belongs to the auricle. He says, "when one hears a continuous sound with the eyes closed, a certain time must elapse before we can account for its origin. If the sound is emitted in a direct line, before or behind, corresponding with the antero-posterior axis of the cranium, it is absolutely impossible to distinguish, with the eyes closed, whether the sound is produced before or behind the head. At the sides, on the other hand, the distinction is easy, when the source of the sound is not very distant, on account of the different intensity with which it is perceived by each ear ; if the sound is distant, very low, or the waves very long, the distinction becomes more difficult, because the difference between the perception by one or other ear is less."

One ear possesses, up to a certain point, the faculty of appreciating the distance at which a sound which we hear is produced. We all know that a distant sound has not the same tone that it would have if produced at a short distance. But in appreciating the distance of a sound the ear appreciates also the direction of it. As this occurs at distances sufficiently great to allow us to neglect the difference produced by the space between the two ears, we must admit some other cause than this difference ; Mach seeks to explain the phenomenon by attributing the hearing of different tones to each ear, and that it is by

(*a*) "Monats der Ohren." 1868.
(*b*) "Archiv in der Ohren," t. viii., p. 150.
(*c*) *Ibid*, t. ix., p. 72.

the tone that we recognise which ear listens, and consequently from which direction the sound comes. To demonstrate this, Mach made the following experiment: When we hear an organ-pipe sound and turn the head alternately to the right or to the left, we notice at each movement a change in the tone of the sound according to whether it is more directly heard by one or other ear. To explain this difference of the tone of each ear, Mach submits that the sound waves may fall with different intensity on the membrana tympani, according as they are presented perpendicularly to the axis of the auditory meatus, or in another direction; for elevated tones the difference will be greater still, because the waves, which do not come perpendicularly, will be already split by the auricle. He concludes that the auricle is a resonator for elevated tones, that the intensity of the resonance depends on the position of the ear in regard to the sonorous agent, and that thus are caused the variations in the tone which enable us to recognise the direction of the sound. This power appears more marked in animals who must appreciate certain noises, such as the rustling of leaves, while man preserves only some vestiges of it.

According to Voltolini, (*a*) the auricle should be considered as an external tympanum, for it exists only for the perception of aerial sounds.

No animals which live in water or underground possess auricles. The structure also favours the transmission of vibrations; if it was simply intended to reflect sounds it would fulfil that function very well if osseous in structure. Voltolini explains the absence of the auricle in birds by the existence of fine and short feathers which are arranged regularly at the entrance of the meatus, an arrangement by which they form a kind of easily vibrating membrane.

Schmeide, Kam, and Weber have shown that under water one hears all sounds more feebly, and the perception of the direction of sound is altogether lost. In this case the aerial vibrations being suppressed, the auditory perception takes place only through the solid parts of the cranium, which explains the diminution in the intensity of the sound, and shows the necessity of aerial vibrations for distinguishing the direction of a sound. We will add that the integrity of both ears is equally necessary. If a vibrating tuning-fork be carried horizontally round the head we can distinguish clearly, with the eyes closed, what is the position of the tuning-fork. If one of the two ears be closed this perception only occurs when the tuning-fork approaches the open ear. We have interrogated a number of persons affected with unilateral deafness; all declare that they have lost the power of distinguishing the direction of sound, and that they always attribute its origin to the side of the unaffected ear. Huntsmen have been obliged to renounce hunting in consequence of the loss of hearing of one side. We have experimented on unilaterally deaf people, and when they had the eyes bandaged they could never recognise the position of a sound except when it was in the axis of the meatus of the unaffected ear, or in a position very near that axis.

We must conclude that the auricle plays an important part in hearing, but the limits of that part are not yet sufficiently determined. In hearing, as in sight, the integrity of both organs is necessary for the function to be exercised in all its fulness.

Burnett (*b*) has sought to show, experimentally, the functions of the auricle. We have not been able to procure his work, but the following are the conclusions he draws: The helix and the fossa of the helix vibrate under the influence of low sounds; the antihelix and its fossa under the influence of middle sounds; and the concha under the influence of high tones. If the finger be applied to the helix and it be pressed strongly against the cranium, deep sounds are heard with less, and acute sounds with more, intensity; the contrary effect is produced when the antihelix is pressed. Burnett explains in this way the alterations of tone which are experienced when the auricle is partially or completely wanting. Burnett recognises, also, in the auricle the power of isolating sounds, and transmitting them thus isolated to the labyrinth. It seems to us impossible to establish this opinion on scientific basis. We shall return to it when speaking of the labyrinth.

A CASE OF GUN-SHOT WOUND OF HEAD.

By John Molony, L.R.C.S.I., & L.K.Q.C.P.I.
Medical Officer, Dromahair Dispensary, co. Leitrim.

In the month of February of last year, I was sent for to see a dispensary patient, a female, æt. 30, who was accidently shot in the head, face, and neck, by a lad who, presenting a central-fire double gun (not knowing it to be loaded) pulled both triggers just as the girl was coming through a door-way; she, hearing some noise in the room in which the boy was standing, looked in, and seeing the gun levelled towards where she was, stooped her head, the first shot taking effect and carrying away a great portion of the scalp, about the size of the palm of a man's hand in extent, the second shot "riddling" her face and left side of neck, tearing through the clothes on the upper part of the chest, without, however, wounding that part. Dr. Nash, of Drumkeeran, was sent for in my absence to see her, who with his usual skill carefully dressed the wounds and shaved off the hair from the remaining portions of the scalp, prescribed an aperient, and ordered mild but unstimulating nourishment.

When I saw her the third day after the injury, she presented the following appearances: face greatly swollen, the features hardly recognisable, with much discolouration of the face and neck from the gun-powder (she was ten feet from the muzzle of the gun when it was discharged), and a great many grains of No. 6 shot scattered here and there about her face and neck, a wound of about an inch long over her left eye, her front teeth knocked out, her tongue also wounded, the scalp carried away to the extent above mentioned, leaving exposed portions of the occipital, both parietals and frontal bones denuded of their periosteum, the edges of the scalp surrounding the wound being much torn and jagged, pulse 120, weak; temperature 102·4. State of pupils not ascertained, owing to the pain caused in trying to open the eyes, tongue swollen, furred, and dry, with difficulty protruded, extremities cold, had been delirious through the night, great thirst, intense pain in head, bowels acted on by the aperient, kidneys also acting, constant inclination to vomit.

Wound dressed and washed with a weak solution of carbolic acid, ordered chicken jelly and milk in small quantities, a hot jar to feet and a chloral draught at night, which gave some hours' sleep. For some days there was no material change in her state, the only change in treatment being light linseed-meal poultices to help the sloughs to come away on the edges of the wound, and a poultice over left eye which brought away a gun wad, a light layer of fresh oakum sprinkled with carbolic acid solution being placed over the poultices whenever the discharge became offensive; now and again the unhealthy granulations were touched with sulphate of copper, the state of the bowels and kidneys being attended to.

After many weeks, there were evident signs of exfoliation going on in the exposed bones, when also albumen was detected in the urine, with partial suppression. Œdema of the lower extremities and a "numbed" feel down the left side of the body with slight anæsthesia; ordered 30 grain doses of pulv. jalapæ co. every night, and the bitart potass. drink (1 oz. to pint boiling water). With the assistance of Dr. McDowel, of Sligo, I removed a portion of the left parietal bone. In a few days afterwards

the paralytic and renal symptoms disappeared. The wound was then dressed with a solution of sulphate of zinc (gr. v. ad ℥j.), the layer of oakum being continued over the saturated lint.

The case went on for many months, with now and again the renal and paralytic symptoms appearing, generally ushered in with increase of temperature and accelerated pulse, once or twice being of an alarming nature, accompanied with delirium and subsultus tendinum; after removing five other pieces of exfoliated bone from the parietals and frontal bones (none of the occipital coming away, though similarly exposed), the various little "peninsulas" and "islands" of granulation joined one with another, and the wound filled in. The patient is now walking about and able to do light work; she still complains constantly of frontal headache, but with that exception no other symptom worthy of notice has presented itself.

I consider the above case interesting, for it is not often that recovery takes place where the head has received such grave injuries; also because of the association of the renal and paralytic symptoms, and the entire absence of erysipelas, notwithstanding the ill-ventilated small room (about ten feet square, where artificial light was always necessary when dressing the wounds) in which the patient lay for many months, not that it necessarily follows because it was a wound of the head that the liability to erysipelas was increased to such an extent as some authorities assert.

ON THE INCONGRUITY OF THE MODE GENERALLY ADOPTED IN STATING THE RESULTS OF MILK ANALYSES. (a)

By William Thomson, F.R.S.E.

For some time past it has occurred to me that the general mode of stating the results of milk analyses is illogical, and at all times places the analyst in a false position. From the general mode adopted for making analyses of milk, analysts cannot, and have no right to say, that a sample is or is not adulterated with water, and they are equally unable to say whether cream has or has not been abstracted from the genuine milk. It has been proved by many different analyses of genuine milk that the variation in its composition is so great, both as regards the fat and solids not fat, that no standard can be taken as representing the composition of genuine milk. The total solids in genuine milk vary from 10½ to 15 or more, per cent. Up to the present time analysts have used standards, and have calculated from these standards the proportions of water added, and on this basis they say—"This sample has been adulterated with so much water," and "That sample is free from adulteration." The question I propose to bring before you is this: What is the law in these matters? Is it that it is illegal for any one to adulterate genuine milk with water; or is it that any one *may* adulterate his milk, provided he does not add too much water, *i.e.* that he does not dilute it below a certain standard? Imagine the position of an analyst *versus* an inspector under two different and very possible circumstances. In the first, suppose the latter sees a cow milked *dry* into a clean and dry vessel, and he takes a sample from it and sends it to the analyst, who finds it to be adulterated with water. In the second, suppose the inspector goes to a shop, and asks the vendor to sell him some milk; and presuming the latter, knowing that his milk is rich, says to the inspector, Sir, I adulterate my milk; and he forthwith takes three pints of his milk and one pint of water and mixes them together and sells part of the mixture to the inspector, who on sending it to the analyst receives a report to the effect that it is free from adulteration. What can be the inspector's opinion of the analyst? and yet, under the present state of affairs, such things may easily happen, but these only show how the analyst may fall into public disrepute.

Here the effects of this objectionable mode of stating results do not end. If an honest man in a small town sells genuine milk, which is pronounced by the analyst to be adulterated with water, the statement is published in the local newspapers, and the vendor suffers both pecuniarily and morally to a very marked degree. If adulteration of milk with water be an offence against the law, and the public be supposed to be injured by it, then the analyst, by his decided mode of expressing results, is constantly acting unjustly towards them, by passing adulterated samples; and if the "standard" method be recognised, then every milk seller ought clearly to understand that if he sell genuine milk, which should at any time happen to fall under the standard, he will be liable to be fined 5s. and costs, or possibly sent to prison for repeated offences against the Act.

If, again, the "standard" method be used, it would well pay a milk seller, who vends from 50 to 100 gallons of milk per day, to employ an analyst to analyse his milk two or three times a week, and from the results to add sufficient water to dilute the genuine milk to the standard, which necessarily must be low, and thus the public will have the satisfaction of learning that analysts, whom they have employed to protect them from adulteration, have secured to them an uniform supply of milk of low quality.

It seems to me, first, that adulteration of genuine milk with water, no matter to what extent, should be considered illegal, (a) and secondly, that the seller should be prevented from vending abnormally poor genuine milk. In the first, it is easily within the power of the inspector and analyst to find whether or no water has been added to milk, independent of any standard, because if, after buying a sample of milk, the retailer be required to declare from what farm the milk was bought, the inspector of the district in which such farm is situated, may be communicated with and requested to see the cows milked and to take a sample of the mixture, which should be sent to the analyst side by side with the sample originally bought. The actual amount of added water could thus be calculated from the difference in the results, and magistrates could then have no hesitation in convicting, and there would, in such instances, be little chance of miscarriage of justice.

I was led to write this paper at the present time owing to the following circumstance:—A man waited on me and stated that the inspector had taken a sample of milk which he sold to him. It had been sent to Dr. J. Campbell Brown, who reported it to be adulterated with 8 per cent. of water. The man said he was certain no water had been added, and that the analyst had made a mistake, and requested me to analyse a sample which had been left in his possession by the inspector. I did so. The milk was decomposed, and on analysis I found the total solids, and solids not fat, to be exceptionally low, and wrote to him to that effect, stating that the analyst was justified in pronouncing it to be adulterated. I said, however, he had one mode of defence left to him, and that was that I should see the cow or cows milked dry into a clean vessel, and take a sample of the genuine milk for analysis, and if it coincided in poorness with the suspected sample, it could be stated in court that the milk was genuine. I went to his house at 6.30 one morning, which was the general time of milking; he explained to me that one cow yielded four gallons of milk, which was sufficient for his custom, and only that cow's milk was sold. I went to the shippon with him and there saw a light roan-coloured cow, *apparently* in good condition. He assured me it was perfectly healthy. I saw it milked dry into a tin, and at once mixed the contents and filled two bottles from it, the one was sealed in presence of the owner of the cow, and immediately afterwards I took both samples away; the sealed one I sent to Dr. Campbell Brown, who analysed and

(a) Read at the Science Congress, before the Society of Public Analysts, at Plymouth, August, 1877.

(a) The law *is* distinct on this point.—Ed.

reported on the original sample, explaining the circumstances of the case; the other sample I submitted to analysis; both our analyses agreed in showing that the genuine milk was of exceptionally low quality.

Dr. Campbell Brown very properly agreed to go further into the matter, and requested the inspector to see a sample taken from the cow and sent to him; this was done, and as it coincided with the sample originally analysed, the prosecution was withdrawn.

Clinical Records.

A CASE OF PUERPERAL MANIA AND CONVULSIONS TREATED SIMPLY BY AN APERIENT AND REPEATED DOSES OF QUININE.

By Dr. G. de Gorrequer Griffith,

Senior Physician to the Hospital for Women and Children; Physician Accoucheur to St. Saviour's Maternity.

I was engaged to attend Mrs. T. in her approaching labour. She is of an excitable and nervous disposition, complexion florid, ordinary height, rather broad in the shoulders and pelvis, is in what would be termed "very good condition," and has always enjoyed excellent health; has never been liable to hysterical attacks or epileptic fits, nor been irregular as regards the menstrual functions. She is quick and vivacious in her manner, her spirits are always good. In years, she is 44, and married late in life—at about the age of 42. She is of very energetic habits, and both before and since her marriage has always been accustomed to be actively engaged in the discharge of her household duties. Some weeks previous to the time she expected to lie in, as she sat at the window in the dusk of evening, a stone was thrown through the pane of glass into the room which she happened to occupy. She was greatly frightened, and at the time felt the child leap very strongly, as if it also was affected by the shock of the fright. That same night, or early on the next morning, there were pains as of labour, and some little "show," but these passed off, and occasioned her no further alarm or uneasiness. About a week or ten days after this occurrence, as the patient was standing on a chair and stretching towards the ceiling in order to reach some article down, the chair slipped, and she fell on the floor, the abdomen coming into violent contact with it. The effects of this accident were a return of the same kind of pains as had come on at the time that she had been frightened, and the "show," the latter being, however, rather more profuse, and sufficient to occasion her some anxiety.

The pains and show were checked, and subsequently entirely stayed by rest in bed, and by the use of opium. She then went her full time, but every few days had a "show," of which she thought nothing, and consequently did not further wish to trouble me. I was sent for on Saturday, as labour was supposed to have set in. I found her suffering "excruciating" pain in the back and lower part of the abdomen, and learnt that there was a profuse sanguineous discharge—so profuse, indeed, that both she and the nurse were alarmed, especially as the patient herself felt weakened by the loss of blood she had sustained. I ordered her brandy and water and a full dose of opium to allay the "excruciating" pain of which she complained.

Vaginal examination enabled me to discover that there was no irregular condition of the vagina itself, that it was sufficiently lubricated to afford every facility for the transit of the child, that the pelvis was roomy in all its diameters, and in no way abnormal as to its dimensions, being well open in its brim, its cavity or canal, and in its outlet; that the head of the fœtus presented; that the os had only just began to open.

Through the open mouth of the womb I felt a soft mass, and this, taken in conjunction with the repeated losses of blood, or "shows," confirmed me in the supposition which I had formed that there was a partial presentation of the placenta.

The excessive pain and the sanguineous discharge subsided after the administration of a little opium, but as the labour was not arrested, and the os continued to open, I prepared myself for interference, as I feared the presentation might occasion danger both to the mother and to her child.

I would here mention that the patient had a presentiment of danger, of which she could not divest her mind, and that she constantly declared she should not get over her confinement, and must die.

This foreboding of evil I could not remove, even though I strove hard to impress upon my patient the necessity for keeping her mind perfectly tranquil, and husbanding her strength for her approaching trial. A few hours subsequently she suddenly became maniacal, started from her bed before she could be restrained, and crying out that all in the room had conspired against her to kill her, rushed towards the wall, with the intention of dashing the abdomen against it, and of, in this way, freeing herself from her pains and accomplishing her delivery.

With very great difficulty she was induced to lie down, and when in bed had to be held there, as she was constantly seeking to rise, in order to fling herself against the wall. Very soon after she was got into bed she was attacked with a violent epileptic or epileptoid fit; the head was drawn somewhat backward, so that the face had an inclination upwards, and the working—that is, the alternating contractions and relaxations—of the muscles of the neck were quite apparent; the entire of the body was convulsed very strongly; at times the posterior muscles would be so synchronously, and then a complete episthotonotic condition would obtain, the whole body, including the trunk and limbs, being forcibly bowed. The forearms were tightly flexed upon the arms, and the fingers were clenched upon the palms of the hands.

This condition lasted for some minutes, the patient all the time breathing with difficulty, gasping, and uttering the peculiar, low, murmuring noise which is common in those cases as each convulsion attacked her. During these minutes she was quite unconscious, not alone to everything around her, but also to the pains of labour, which, I apprehend, continued in the same manner as they occurred before the convulsive seizures, inasmuch as the uterine contractions went on during the fit—a fact I learned by placing my hand on that portion of the abdomen the walls of which lay upon and covered the womb. The muscular tissues of the womb seemed to me to contract at the same time that the rest of the muscles of the body were affected with the epileptiform spasms. The fit passed off, the patient awaking to a kind of drowsy consciousness, not making any complaint, nor at all speaking until she was shaken and addressed. Soon after this she awoke to full possession of her senses, spoke intelligently, complained of feeling weary and of a soreness in the stomach, asked for a drink, and to be left to herself.

I gave her some brandy and water; shortly afterwards she fell asleep, and slept, not only soundly, but too deeply, the sleep being somewhat rather of a comatose condition, than natural, healthy repose.

While lying in this state she seemed perfectly tranquil, and remained so for about three-quarters of an hour; then suddenly starting up, she leapt from the bed, and tried to injure herself. She was caught by the attendants and put back into bed, where, however, she had to be held till this maniacal state passed away. It lasted for some hours. The treatment was simple; a drop of croton oil was laid upon the tongue, and washed down with a dose of sulphate of magnesia; this, in half-an-hour's time, was followed by quinine in half-grain doses every half-hour, till all likelihood of the occurrence of fits had passed

away, the head being kept cool by means of ice. The aperient acted speedily, and there was no return of the fit after its operation.

Since then the patient has had more children, but with no sign of either mania or convulsions.

Transactions of Societies.

MEDICAL SOCIETY OF PARIS.

Translated from *l'Union Medicale*, by T. LAFFAN.

AT the sitting of the 26th May, under the presidency of M. Morier, M. Dieulafoy communicated an interesting case of hydatid cyst of the liver, cured by capillary puncture. The patient was a man, æt. 31, he had been afflicted with a bulky abdominal tumour, situated in the right hypochondrium. The patient stated that he had an attack of urticaria about three years ago, and then pain in the right shoulder, and pleurisy in the right side. Two years ago the abdomen began to enlarge. At the time he was seen, the patient's respiration was most laboured, he had no appetite, and his strength was diminishing rapidly. M. Dieulafoy practised capillary puncture, with the No. 2 needle of the aspirator, assisted by M. Monod, who had called him in in consultation. The puncture permitted the escape of two thousand two hundred grammes of liquid (near half-gallon British), which on examination by the microscope, presented characteristic hooklets. Almost immediately afterwards there came on a general eruption of urticaria, which as rapidly disappeared.

The patient recovered perfectly. After some remarks as to the subject-matter for increased observation presented by the curious urticaria complication, and the frequency of its occurrence in puncturation of the liver, the *séance* adjourned.

A case somewhat analogous was operated upon by me in 1871, immediately after the first appearance of M. Dieulafoy's pamphlet. The result, which was very gratifying, was given to the public in the *Dublin Journal of Medicine* of the next year. The case attracted considerable attention abroad, for M. Dieulafoy's instrument was on its trial. I might, however, have indulged in the *sic voce non nobis* strain, for whatever good it did to an Indian Parsee, it did me very little. Just two years after, the wife of a much respected dignitary of the Protestant church in this country lost her life under circumstances less onerous than those under which many a pauper's has been saved. At the twelfth hour, the tapping of a hydatid cyst was entrusted to a relative, a distinguished London surgeon, Mr. H—. The cyst was then suppurating, and the result was of course what might have been expected. We happened to meet Mr. H—, and in reply to our pointed query, Had this been done before now, would not the result have been different? the emphatic reply was, Do not press me for an answer. Our only share in the transaction was the humble one of lending some of the apparatus. Verily, what betwixt polemics and the jealousy that brooks no consultation, science must indeed be cultivated for her own sake in rustic neighbourhoods.

The success of Dieulafoy's instrument is now so assured, that our *confrères* across the Channel only discuss the comparatively insignificant complications attending its use.

Cauterisation in Carbuncle.

DR. CHAVANIS, in the *Lyon Medical*, states that in a case of anthrax he employed excision and cauterisation with the chloride of zinc paste, and subcutaneous injections of carbolic acid, and salicylic acid internally, but that on the whole carbolic acid does not seem to him to fulfil all its theoretical promise. Three cases of Raimbert's, one of Cezarl's, and his own, are favourable to the use of antiseptics; but it is not on so small a number of cases, in which the cure may be due to cauterisation as much as to antiseptics, that a new treatment can be based. Cauterisation is necessary; carbolic acid may also be employed as an adjuvant, in subcutaneous injections, compresses on the œdema, and also internally, without the pretension of being a specific against anthrax. In all respects iodine seems preferable.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
Is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
„ IF PAID IN ADVANCE 1 1 0

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 12, 1877.

MEDICAL REFORM.—I.

IF by any possibility any Minister could be induced to undertake a measure of Medical Reform, in order to be successful, and to complete it in a manner worthy of a statesman, he would have to deal with it as a comprehensive whole, and thus almost begin *de novo*. In fact, he would have to employ the method advised by Herbert Spencer for all scientific and general inquiries, viz., to commence with first principles, and when these were clearly established and defined then to raise a superstructure, otherwise his efforts would only result in patchwork, and we do not now want fractional legislation. We may briefly point out the difficulties in his path, and also show what are the *desiderata* for satisfactorily arriving at a proper solution of this vexed question.

Medical reform must not be looked upon from our point of view alone; it will not have to consist solely of the preservation or extension of existing privileges, nor of the addition of penal enactments and clauses, nor of pure class legislation; but any policy to be successful must be framed essentially for the protection of the community and the security of the individual, as it is to be above all remembered that the public do not exist for our benefit, but that our only *raison d'être* is their advantage. Starting then in the region of first principles, preliminary education will be the first subject demanding attention, and there should be no difficulty on this point. The struggle for national education is now over, and it is a confirmed axiom of every politician, of every shade of opinion, that every child born on British soil shall have as a birthright, instruction in the first elementary principles of education — reading, writing, and arithmetic.

Presuming that the candidate for the medical profession has a knowledge of the three *R's*, a higher standard of education must also be required which will fit him for the high position he ought to occupy, in the social circle, and as a powerful integer in the direction and shaping of our national manners and morals. It will, then, be necessary to frame some standard, which will give us a guarantee of a certain value that his mind is sufficiently prepared to enter on a course of still higher training.

The increasing activity in our educational circles, the higher standard of knowledge expected of those who have no profession, and the education even of the masses, all indicate that the preliminary education of the embryonic medical practitioner should advance *pari passu*. It will be urged, as it has been urged in the past, that the setting of a leg, or the performance of any surgical operation, can be as well done by the man who has not had the advantages of an university or even grammar-school education, as by the man who has had. And here, in this objection, we have almost the root of the evil, which has so long fettered the advancement of our profession. We have too long looked upon medical education in its purely surgical aspect, we have too long allowed surgical monopoly in its direction, and we have been educating surgeons to perform essentially medical functions, though, we must confess, not without protest from individual minds, not without words of warning from medical journalists, hitherto directed to unwilling ears, on the absurdity and fallacy of the system. With more advanced views we look upon medical preliminary education, not in a medical, or in a surgical, or in a special-branch light, but as it affects the general welfare of the country and the individual welfare of the whole profession. We have long recognised the influence of medical men upon our national manners and morals as a powerful engine of good, and we believe this influence might be extended with still greater advantage to the community, and also to the elevation of our social position. In our previous articles on the remedial measures for quackery, and on citizenship in sanitary work, we have shown how intimately the medical attendant is connected with the inner life of the country, with the directorship of its bodily welfare, with its social improvement; that his *rôle* embraces pure medicine, midwifery, hygiene, and, least of all, surgery; and that for nine-tenths of the population he fulfils the office of adviser, confidant, and physician. We do not pretend that a higher standard of preliminary education will give us a perfect assurance of a superior class of practitioners; we do not pretend that every candidate who passes such an examination as we deem necessary will have a special fitness for the medical profession; but we do claim that it will give us a better guarantee than the present system, and that the social advantages of introducing a better educated body of men must have a beneficial reaction on the profession. We do not insist upon too high a test; and for the sake of argument, in taking the matriculation of the London University, we believe we are not asking for too much. Other earnest promoters of educational progress in the profession would even go further and suggest the necessity of a preliminary scientific training.

Mr. Quain, when he delivered the Hunterian oration, pointed out the benefits that would be derived, "supposing that at school young people had acquired some exact elementary knowledge in physics, chemistry, and a branch of natural history—say botany—with the physiology connected with it. They would have thus gained some necessary knowledge with some practice in inductive reasoning. The whole studies of medicine are processes of observation and induction—the best discipline of the mind for the the purpose of life—by that plan the burden of the early medical course would be much lightened, and more time devoted to practical studies."

Professor Huxley has also expressed his opinion, and, looking at the question in its bearing on the public benefit, and not in a purely class light, in the following forcible and practical words, giving utterance to his ideas:

"There is no one of us who may not at any moment be thrown, bound hand and foot by physical incapacity, into the hands of a medical practitioner. The chances of life and death for all and each of us may, at any moment, depend on the skill with which that practitioner is able to make out what is wrong in our bodily frames, and on his ability to apply the proper remedy to the effect. . . . A young man commencing the study of medicine is at once required to endeavour to made an acquaintance with a number of sciences, such as physics, as chemistry, as physiology, which are absolutely and entirely strange to him—not only is he devoid of apprehensions of scientific conceptions—not only does he fail to attach any meaning to the words 'matter,' 'force,' or 'law' in their scientific senses; but, worse still, he has no notion of what it is to come into contact with nature, or to lay his mind alongside of a physical fact. The youngster, thus unprepared for serious study, is turned loose among his medical studies, with the result, in nine case out of ten, that the first year of his curriculum is spent in learning how to learn. Indeed, he is lucky if, at the end of the first year by the exertions of his teacher and his own industry he has acquired even that art of arts. After which their remains not more than three, or perhaps four, years for the profitable study of such vast sciences as anatomy, physiology, therapeutics, medicine, surgery, obstetrics, and the like, upon his knowledge or ignorance of which it depends whether the practitioner shall diminish or increase the bills of mortality. Now, what is it but the preposterous condition of ordinary school education which prevents a young man of seventeen, destined for the practice of medicine, from being fully prepared for the study of nature, and from coming from the medical school equipped with that preliminary knowledge of the principles of physics, of chemistry, and of biology, upon which he has now to waste one of the prescious years, every moment of which ought to be given to those studies which bear directly upon the knowledge of his profession."

MILK SICKNESS.

In a long article in the current number of the *Veterinary Journal* Prof. James Law, F.R.C.V.S., Cornell University, Ithaca, U.S.A., has given a full and interesting account of a disease of which little or nothing is known in this country.

The disease is prevalent among cattle and human beings in various primeval and unreclaimed districts of America; it is a contagious disease, and has received its name from the fact of man contracting it chiefly through drinking the milk of infected cows. The symptoms are well-marked, and are very characteristic. In milch cows they may be very slight, for the outlet for the poison through the mammary secretion appears to protect them from the graver phenomena. But in steers and other dry cattle and sheep the symptoms are well marked. There is great nervous and muscular prostration, tremblings of the body, the breath sweet or fœtid, with blood-shot eyes, and staring coat; the bowels are obstinately constipated, and, in vomiting animals, emesis is a prominent symptom. In all cases prostration is one of the most characteristic features of the disease, and when death ensues it is by asthenia.

In man the first symptoms are feelings of languor and muscular weakness, with nausea and vomiting. The patient soon seeks a recumbent posture, and the disease is rapidly developed. The pulse is generally slower, and temperature lower than natural. There is a flushed or rather bronzed and dirty appearance and a dry state of the skin. The breath is fœtid and of a peculiar odour. The stomach and bowels are apparently empty, the abdomen is retracted, and there is obstinate constipation. All the secretions and excretions are rapidly diminished. The urine is rarely voided, it is clear and limpid, below the normal specific gravity, and rarely deposits a sediment. The mind is generally in a state of hebetude expressive of utter indifference or *abandon;* but delirium is a rare symptom. The muscular weakness daily increases until the patient cannot raise his head or put out his tongue. The vomiting persists; the great muscular prostration increases, as shown by the peculiar decubitus, dependent position of the head, &c. The patient gradually passes from a state of stupor into one of coma, more or less profound; respiration and circulation become gradually weaker, there is a failure of all the vital forces, and death ensues without a struggle. Some cases, however, run an exceedingly limited course; others completely overwhelm the subject, and death by coma takes place within one or two days from the commencement of the disease. Convalescence is also peculiar, and is rarely ushered in by a critical evacuation of any kind. It is generally marked by a cessation of the characteristic symptoms and a gradual resumption of the impaired and suspended functions.

Now, with regard to the *etiology* of this disease, the most interesting fact to notice is, that a "constant condition of its prevalence is the unreclaimed state of the land on which it appears." In the Carolinas and Georgia it is found only on the highest mountains; and in Kentucky, Ohio, Indiana, and Illinois only on the heavily timbered lands or marshy river bottoms in their virgin condition. But the removal of the primeval forest, the drying of marshy spots, and the general cultivation of the soil is the signal for its disappearance. "In many localities," remarks Dr. Phillips, "where it formerly prevailed to a dangerous extent within the memory of the present generation, it has now, by reason of the cultivation of the soil, been entirely exterminated." Although there is no uniform geological condition in the different districts in which the disease prevails, Dr. Law is of opinion that when introduced into a locality, its permanence is, in common with other enzootics, directly dependent upon the nature of the soil and the imperfection of drainage. In the *milk-sick* localities, the retentive nature of the soil is a matter of common observation. They are rich unbroken lands, more or less dotted with marshy spots, and over circumscribed beds of clay or other impervious material that will retain moisture and generate malaria, and that these conditions are essential to the preservation of the poison, is that it is never found to exist in the soil apart from them. Many have attributed the disease to the ingestion of poisonous plants, but this explanation fails utterly to account for the fact that the poison is manifestly reproduced and multiplied in the animal system, and that the smallest quantity of diseased flesh or milk may infect fatally. According to the microscopic observations of Dr. Phillips, it would appear to depend rather upon the presence in the blood of certain vegetable organisms. In one example, Dr. Phillips found the blood to contain a great number of living moving spiral bacteria, similar to those described by Prof. Lebert as abounding in the blood of relapsing fever patients. Dr. Schmidt, however, denies the existence of bacteria in the blood of his cases. But that the disease arises from the blood being infected with germs of a specific nature, there can be very little doubt, and is quite in keeping with the fact that the disease is produced in widely different conditions of climate, vegetation, and geological formation. For reasons, above mentioned, cows giving milk do not show the disease at all, but their calves have it all the time as long as they suck the milk. As might be inferred from the name, the disease is generally caused in man by the use of the milk; and according to the experiments of Dr. Schmidt, the poison resides mainly or exclusively in the cream and butter. There is, however, reason to believe that neither milk nor butter is essential to the development of the malady in man, but that the human being contracts the affection just as do cows and other animals. Dr. Phillips adduces cases in which the patient denied having used either milk, butter, cheese, or fresh meat for months prior to the attack. Mr. Beardsley, too, was acquainted with wells in the woods that had the general reputation of producing milk-sickness in man or beast that drank from them.

Some idea of the pathology of this affection may be gained from the brief description above given. Some have considered it to be identical with malignant anthrax, but though like that malady, it is enzootic in malarious localities, and is communicable by ingestion of the morbid products of the disease; and though bacteria are present in the vital fluids, it is in no way interchangeable with it, and never gives rise to malignant pustule, splenic apoplexy, black-quarter, and other varieties of malignant anthrax. Enlarged spleen is never observed. The disease has a period of incubation varying from a few days to as many weeks. The virus expends its energy on the great nerve-centres, and the most prominent symptoms are those of asthenic muscular weakness, constipated bowels, and impaired functions generally. There is neither the hæmorraghic extravasation nor the extensive sloughts which characterise anthrax, nor does it resemble any of the malarious fevers. It shows no periodicity, there is no increase of body tempe-

rature, and it is not controlled by quinine or other anti-periodics. A poison is introduced and proliferates in the animal system, and is transmissible from one system to another. The nervous and especially the sympathetic system is overpowered, as are also the functions of circulation and nutrition. Tissue waste is arrested, as shown by the small quantity and low density of the urine and the absence of urea in the blood; and lastly, one attack affords no immunity from a second, but rather predisposes to it.

Unfortunately, there is little to be said in the way of treatment. Some have administered large and frequently repeated doses of purgatives as well as active enemata, and some have thought to stimulate the nervous system by strychnine, and the vaso-motor system by belladonna. Others have prescribed with success five or ten doses of calomel, repeated four times in the twenty-four hours. All acknowledge the value of a free use of brandy or whisky as a stimulant. "But it does not," remarks Dr. Law, "seem to have occurred to anyone to try the effect of such agents as the sulphites, iodides, carbolic acid, and the like, in destroying the poison, or setting a limit to its increase."

THE PHYSICIAN, THE PRIEST, AND THE PEOPLE.

ALTHOUGH the address of Dr. Bucknill, delivered before the British Medical Association, has been much admired for its originality, few have thought it worth while to comment upon the subject which Dr. Bucknill chose for his discourse. That subject was certainly calculated to attract to it more than ordinary attention, as it is not very often a scientific association listens to a discourse on auricular confession, and on the relative duties of the physician and the priest. As, however, the address was given in connection with the Section on Psychological Medicine, it naturally opened with a few remarks of a more purely professional nature than those which characterised the rest of the address. There were three points to which the attention of his audience was particularly directed: the narrowness of mind which is apt to warp the judgment of the psychological expert, and indeed of all who are engaged in special employments; the large amount of instruction and guidance for his own work the physician of the mind can derive from a better knowledge of the outside world; and, on the other hand, the deal of light he can throw upon some of the most important and most obscure problems of human life.

That man is the creature of his social surroundings, and that the character of different races of men is developed from their objective surroundings, was known ages before Buckle wrote his "History of Civilisation," or Herbert Spencer his "Sociology;" and that medical specialists form no exception to this rule the annals of forensic medicine and our voluminous law reports too plainly show. Dr. Bucknill, however, seems to overestimate the extent to which the mind of the psychologist is influenced by the peculiarity of his studies and of the business of his life. That the sound mind can be made to vibrate the discords of unreasoning by association with the unsound is, he remarks, "a dreadful fact, dimly revealed in the history of our specialty," and in order to escape those touches of imperfection from the contagion of his surroundings, the mental physician is exhorted to have recourse to frequent recreation of mind and body, to sane companionship, and sound-minded occupation and study, to breathe the pure air of rational life, and to make himself more familiar with the outside world. No one will dispute the propriety of this advice, but it may be doubted whether, as a rule, the alienist is so influenced by the minds of his patients as Dr. Bucknill's remarks insinuate. If he were in the habit of associating with, and of being much in the company of the insane, his mind would certainly be tinctured by the peculiarity of his associations. But, generally speaking, the consulting physician or the superintendent of a lunatic asylum spends very little more of his time in the society of his patients than a general practitioner does in the course of his rounds. Much of the personal attendance upon the insane is left to subordinate officials—to warders, keepers, nurses, &c. Indeed the keeper is much more exposed to the contagion above mentioned than the physician is, while he is, moreover, more susceptible to its injurious influences, considering that his mind is naturally weaker, and, from the monotony of his occupation, particularly vacant and open to external impressions. But that, with regard to those lunacy inquiries in which the psychological physician is occasionally engaged, his opinion is apt to be prejudiced and biassed by the peculiar train of thought to which his mind has been habituated, has been often illustrated in our courts of justice. Dr. Bucknill refers to a case in which a lady was considered insane because she carried a dagger in her dress, carrying such daggers being a common freak of fashionable dressmaking unknown to the innocent physician who examined her. Other instances he had also met with in men who had been certified and treated as lunatics on account of certain habits which, although unnatural and portentous to Englishmen, had been acquired in countries where such habits were common. These mistakes, however, are not, in our opinion, of common occurrence among accomplished physicians. They are more apt to be committed by medical men engaged in general practice, who are often called upon to certify to the insanity of patients, but who, from their want of knowledge and experience, frequently assign insufficient reasons for their signing a certificate of lunacy. Nor is it to be forgotten that much of the difference of opinion which we see publicly expressed by psychological experts is owing to the partisan manner in which their services are engaged, and which not infrequently tempts them to magnify the import of evidence upon which, under other circumstances, they would not have placed much value.

A far more flattering view of the duties and opportunities of lunacy physicians is the assistance they can give towards the solution of some of the "most important and difficult problems of human life." "Were it not," says Dr. Bucknill, "that men were too selfish and passionate to follow our advice, we could give counsel which, if followed, would prevent fools and madmen from being born into the world." Considering, however, the number of fools

there are in the world, we fear it will be a long time before psychological medicine will have any influence in realising such sanguine anticipations. As far as good counsels go, both the physician of the mind and the physician of the body can do much towards improving the physical and mental condition of the community. They can teach the "right principles of sound-minded heredity, and healthy fecundity and fœtality." They can give valuable advice as to the better methods of education for healthy children, so as to avoid the evils of physical and moral insanitation, of excessive brain-work, and of vicious habits or immoral practices; and they may unravel some of the mysteries of the criminal mind, so as to enlighten "the law-making classes as to the genesis and real characteristics of the law-breaking classes." But preaching is one thing and practice another. It is so easy to give advice, so difficult to follow it. And perhaps, as we remarked on a former occasion, the progress of hygiene and sanitary science will always be in advance of public opinion and public action. The prejudices and passions of mankind are too strong for us; and if we would aim at something higher than improved drainage, model houses, and immaculate air and water, we must endeavour to gain our object gradually, and by various indirect and circuitous paths. There is, however, much to hope for. There is a sort of "evolution" in the moral and intellectual, as well as in the physical world. Hence that spirit of benevolent rationalism which has within the last century exerted so much influence upon the habits and opinions of mankind; hence the impetus that has been given to the general education of the people, and the active share which a most unselfish and liberal profession has taken in the physical improvement of all classes of society.

Notes on Current Topics.

Increase of Drunkenness.

We have only to glance at the daily papers to see how much intemperance is on the increase, and what strong reasons there are for the legislature taking some measures to put a check upon the evil. A few days ago at the Annual Brewster Sessions for the Staincross Division of the West Riding Constabulary, Mr. Superintendent Sykes called the attention of the magistrates to the alarming amount of drunkenness prevailing in the town of Barnsley. During the past year, 1,040 had been proceeded against, whereas in the previous year the number was only 884. He also mentioned the significant and suggestive fact that drunkenness among the wives of working men had seriously increased during the past two years, owing to the facilities afforded for purchasing intoxicating liquors under the guise of groceries. There can be no doubt that the grocers' license to sell wines and spirits is nothing less than a most serious social evil, and has done much to increase the prevalence of drinking, and especially of secret drinking, among all classes of the community. It is well known what an enormous business is being done by a certain firm of wine merchants through the medium of the grocers, and how, through their agents alone, to say nothing of other grocers, unprecedented facilities for the purchasing of wines and spirits are now offered to the inhabitants of every town and village of the kingdom. The housekeeper cannot have a parcel of groceries sent to her house without there being inclosed some advertisement or price-list of the wines and spirits vended, the cheapness of which and the ready, convenient, and secret manner in which they can be obtained, is of course a great temptation for people to buy them, who before had seldom a bottle of wine or spirits in their house. Instead of the old-fashioned gooseberry or currant wine, upon which the sober villager used to regale, he is now invited to provide himself with a little marsala, or cheap sherry, at one shilling and sixpence per bottle, or if he wants something stronger, a little gin at one and tenpence.

Another fact of which we have daily illustrations is the misery entailed upon the children of drunken parents. Thus in the same paper, in which we are informed respecting the increase of drunkenness at Barnsley, we read of four miserable children being charged with begging. The family consisted of father, mother, and six children, the latter being in a most filthy state. They all occupied one bedroom, but there was no bedding of any description, the family sleeping on bags. The father and mother were habitual drunkards, and hence the neglect of their children. No doubt had Mr. Bradlaugh or Mrs. Besant entered this hovel they would have put down all the poverty and misery around them to over-population, but this is not the real cause of all the evils that have been ascribed to large families. Improvidence and drunkenness are at the bottom of most of the poverty, dirt, disease, and crime, which are so prevalent in the more crowded districts of large towns. Improvidence, waste, and extravagence, are conditions over which the government cannot exercise any control; but over habitual drunkenness it can, and before long it will be forced to do something to check an evil which is a disgrace to any civilised country.

The Overworking of Coroners.

An accident occurred the other day, owing to circumstances which must not be lost sight of when Parliament takes into consideration the amendment of the present law respecting the office of coroner and the holding of coroners' inquests.

At the usual monthly meeting of the East Moulsey local board, on Tuesday evening, it was stated that in a case of suicide Mr. William Carter, the coroner for East Surrey, had delayed the holding of an inquest for six days, the body becoming during that long interval in a state highly dangerous to the health of those living in the same cottage with it. In a letter to the Home Secretary Mr. Carter said: "The delay complained of was quite unavoidable on my part, in consequence of the number of cases I had fixed before receiving the official information of the death—nine in number—some at St. Thomas's Hospital, the authorities and relations of the persons wishing the cases disposed of in consequence of the extreme heat. Some are cases by drowning, the persons having been in the water many days, eight to ten of

which are in a terrible state of decomposition. I had upwards of twenty cases last week, and others I had to forward to my colleague that there should not be an unnecessary delay. Some of mine are far apart. I did all I possibly could to take them. My last case last night was six o'clock, so that I did not get home until just before nine, having first gone a distance of twenty-two miles out."

It appears that the board did not consider Mr. Carter's letter at all satisfactory; but, supposing that it was not in his power to get a deputy to conduct the inquest in question, we do not see that he is so much to blame. Considering that coroners are at present paid according to the number of inquests they hold, it follows that it is not their interest to shirk the duties imposed upon them, and, according to his own statement, Mr. Carter certainly tried to get through as many inquests as time and opportunity allowed. But if complaints are made now that coroners have every incentive to hold not only inquests that are really necessary, but also inquests that are not necessary, what will be the result when coroners are paid by a stipulated salary, and not according to the work they do. In many respects the present plan in which coroners' services are remunerated is a good one, and was adopted in order that the coroner should himself have an interest in furthering the ends of justice and in preventing any attempted evasion of the law. That now and then the practice has been abused, and that inquests are often held when a certificate of a medical man would do as well, is generally admitted. But this is an error on the right side. Better that a few people should be put to the inconvenience and annoyance of an inquest than that one of them should be liable to die under suspicious circumstances without any official inquiry being made into the cause of his death. There can be no doubt that both in the fees paid to the general practitioner for attending an inquest or performing a *post-mortem* examination, and in the present method of paying the coroner, the public have some security that their interests will not be neglected. On the other hand, when the coroner knows that his salary is the same whether he holds a large or a small number of inquests, he will, under some circumstances, be tempted to evade the performance of his duties as a coroner, especially when such heavy demands are made upon his services as appear to have been made in the case of Mr. Carter.

Suggestions for Restoring Suspended Animation.

We commented in a recent number upon the many deaths by drowning which not unfrequently might be prevented if certain precautionary measures were adopted. A sad case having occurred at Scarborough during the past few days, in which doubts were expressed whether artificial respiration would not have restored animation had it been persisted in by the medical attendant. Dr. Peirson of that town gives a few practical hints as to treatment which he has found signally successful during some thirty years' experience at the sea-side. Our correspondent says:—

A case is recorded in which life was restored by the most persevering friction, which was kept up for eight hours before the humanity of the surgeon, Dr. Douglas, of Havre, was rewarded by a return of respiration, with artificial respiration by a small pair of bellows, &c., which is required in all cases of suspended animation, whether from drowning, injury, noxious gases, chloroform, or narcotic poison. But the air must be forced into the lungs with very great gentleness; at the same time the body should (in drowning) be wiped dry and assiduously rubbed with hot flannel cloths, hot bricks and bottles of hot water wrapped in flannel should be put under each arm, the feet, and the stomach, according to the urgencies of the case. The head should be raised and ammonia applied to the nostrils, and suitable stimulants given if able to swallow, and treated on the general principle of medicine. But, when able to procure it, I have invariably had recourse to the warm bath, at a temperature of from 90 to 95 degrees Far., and should the respirations not be quickly restored, whilst the friction is being continued for some time, have recourse to the galvanic battery, which I have found of the greatest service if all the usual means have failed, and I consider every medical man who is called to a case of asphyxia from drowning or strangulation ought to provide himself with a portable galvanic battery, and to see that it is in perfect order previously, as they are now to be had in every large town so cheaply, can be carried under the arm like a book, and of sufficient power for all ordinary purposes. In most cases of suspended animation, where its use is indicated, I have found it almost invariably most useful. The great want of my galvanic battery, after all other known means had failed, I found some years ago, when I happened to be visiting a patient on the North Cliff. I was hastily summoned to the case of the late Mr. Allen and his friend Mr. Lloyd (two collegiate students then visiting Scarborough). The former was a good swimmer, but far from being a strong man, he succumbed in the brave and noble attempt to save the life of his friend, who could not swim, and whom he saw struggling for life in the water, until assistance was rendered him from the shore by a man on horseback. Mr. Lloyd was the first to be landed, and seemed to be in an almost hopeless condition, but after my exertions for more than an hour, with all the known means at my disposal, he was happily restored to his friends. I also spent more than three hours over Mr. Allen in trying to restore animation, but found he had been too long in the water for resuscitation.

The Changes in the Ciliary Processes During Accommodation.

The theory of accommodation, formulated by Helmholtz, Graefe, and others, is confirmed by the observations of J. Hiort in a patient deprived of the iris by traumatic causes (total traumatic irideremia), in whom the ciliary processes could be distinctly seen by oblique light, the ophthalmoscope, &c. It was easy to study the action of the ciliary body during accommodation, and after instillations of extract of calabar bean and of atropia. His observations showed that in accommodating for near objects, 1, the obscure border of the lens became wider; 2, the ciliary processes approached the axis of the eye and became swollen; 3, the distance between the edge of the lens and the ends of the ciliary processes (zonular space) did not appear to undergo any change; 4, these changes were not instantaneous, but demanded an appreciable time. Relaxation of accommodation was also accomplished in a gradual manner. The distance of the lens from the sclerotic was increased during accommodation, and just enough so as to correspond with the advancement of the ciliary processes. By the action of atropia, the ciliary processes receded a little, but it could not be ascertained that there was any change of zonular space.

Payment of Irish Poor-Law Medical Substitutes during Illness.

THE Killala Dispensary Committee having appointed a medical officer, proceeded at once to resolve:—

"That on any future occasion of the doctor requiring a substitute from any cause, to perform his duties, the expense of such substitute shall be borne by him, unless the committee consider that under the circumstances of the case the district should pay the cost of same, or any portion thereof."

It ought not to be necessary for us to remind our readers that a Board of Guardians has no power whatever to make such a rule, nor need the medical officer hold himself in the slightest degree bound by it. By the 22nd Article of the Dispensary Regulations the medical officer is entitled, as a matter of right, to his sick leave as soon as he has notified his illness to the hon. sec. of his committee, and *recommended* some competent person as *locum tenens*. This done he has nothing whatever to say to the question of payment. The guardians *must* pay him, and they *must* pay the *locum tenens* also if he makes his bargain beforehand, but not otherwise. Dispensary medical officers commonly put themselves in a false position by meddling in the appointment of a substitute, and making a private arrangement with him to take the duty. If they do this they should make him distinctly understand that they have nothing to say to the payment, and that he must make his own bargain or suffer the penalty. This privilege of the medical officer applies to no case except illness, and we presume the committee may demand evidence that the illness is such as to incapacitate from duty.

The Contagious Diseases Acts.

THE debate on the extension or repeal of these Acts, formed one of the most lively episodes of the late British Medical Association meeting at Manchester. Mr. Lowndes and Professor de Chaumont led the sortie in favour of extension, while the abolitionists secured a very important convert in the person of Dr. B. F. McDowel, Surgeon to the Lock Hospital, Dublin. Dr. McDowel ought to be able to express a very reliable opinion on the general question of the relation of unrestricted prostitution to the propagation of syphilis, and his views were, on this occasion, stated very emphatically in favour of the abolitionists. Our sympathies, as our readers know, have always been in favour of the control of prostitution, and we shall be glad to hear any good scientific reasons for the removal of such control. We cannot, however, recognise as a valid reason, the desirability of permitting the propagation of venereal as a penalty upon prostitution. We might, as reasonably maintain that typhoid fever should be cultivated as a tax upon dirt, or gonorrheal ophthalmia as a penalty upon undue amativeness. We should like to see the subject discussed without the intervention of this or the religious argument. Can the would-be repealers of the acts really disprove the statement that their effect is to stamp out syphilis? If not they may, we think, spare the profession the argument of the question on sentimental grounds.

Forging Certificates of Death.

ONLY a week or two ago we had occasion to notice a case in which a medical assistant was charged with the above offence, and we remarked at the time that the practice is more common than is generally supposed. That it is a crime which may be easily committed, and that therefore there is all the more reason for inflicting upon the offender the strongest penalty allowed by the law, is again shown by a case which came last Thursday before the Manchester City Police-court. An undertaker and his wife were chargedwith uttering a number of forged medical certificates of death. The prisoner was agent for the Prudential Assurance Company, and the prosecution had reason to suspect he had an ulterior motive in what he did. He obtained forms of certificates of death, given by medical men, and filled in the names of persons alleged to have died, and signed them with the name of some medical man. He took these certificates to the registrar of the district, and tendered them, in order that the death might be registered. After registration he went to the assurance company and entered the "death" in their books. This was done in a great number of instances, and they proposed to proceed against the prisoner for uttering certificates knowing them to be forged.

We shall not now enter into the details of the case; suffice it to say that the prisoner was committed for trial at the assizes, bail being refused.

Slate-Paper.

PROF. MARX, of Stutgart, has originated an exceedingly handy method for preserving drawings or diagrams made with chalk upon a black surface for lecture purposes. It is frequently necessary to place figures or drawings upon the black board which have to be wiped off again, and have to be re-written every time they are wanted. He has caused the firm of C. Lienhard, of Stutgart (manufacturers of paper-hangings), to make an endless dead-black paper, one metre wide, of which a piece of the necessary length is cut off and pinned upon a flat surface. When the drawing or writing is finished, the chalk is fixed upon the paper with a dilute solution of shellac made by dissolving 50 gm. of bleached shellac in one litre of alcohol of about 85 per cent., and filtering. This solution is applied by means of a spray apparatus. The chalk-marks disappear at first, but reappear on drying.

Artificial Atrophy of the Eye.

DR. N. FEUER describes the method employed in the clinic of Professor Schulek to produce artificial atrophy of the globe of the eye. A small seton of thread is introduced into the vitreous, by means of a curved needle passed behind the ciliary body; this is left in position four to six hours, until a slight chemosis is produced, when it is withdrawn. Subsequently atrophy of the organ occurs. This operation has been used in most diverse cases, such as hydrophthalmos, staphyloma, ciliary pain following anterior synechiæ, and even to prevent sympathetic trouble. No bad results have supervened, and there is thus obtained a stump which answers very well for the adaptation of an artificial eye.

Photographs of Microscopic Preparations.

Dr. Allen Thompson, the President of the British Association, brought under the notice of the Biology Section the approaching publication of a series of photographic representations of the minute distribution of blood-vessels in a number of the organs of the animal body, made under the superintendence of Professor Dantscher, of the University of Innsbruck, from preparations made by himself. Dr. Thompson saw some of these preparations some years ago at Innsbruck, and admired them much. The collection had since been much increased, and the photographs, executed partly on paper and partly on glass, and some of them coloured after the original preparations, are capable of being viewed with the stereoscope, so as to give a most truthful and instructive view of the beautiful structures they represent. Dr. Thompson regretted that accidental circumstances had made it impossible to show some of these photographs to the Section. They are all to be presented to the meeting of German naturalists at Munich in September, and the work would be dedicated to the University of Zubingen on the occasion of the 400th anniversary of its formation, which was held in the past month of July. Professor Rolleston made some observations on the arterial supply of various parts of the brain. He strongly supported the theory of right-handedness as caused by the better irrigation of the left side of the brain. Professor Redfern, on the other hand, did not believe that right-handedness was to be accounted for in the manner supposed by Dr. Rolleston.

Mallow Spa Water.

Messrs. Wm. Plunkett, Fellow of the Chemical Society, and Lancelot Studdert, LL.D., have published an interesting report on the "Solid and Gaseous Constituents of the Mallow Spa, in the County of Cork," which was read before the Royal Irish Academy, June 23rd, 1877, and published in the "Proceedings," 2nd Sec., Vol. III. (Science). The waters, according to their analyses, contain carbonic anhydred, 43·28; oxygen, 5·75; and nitrogen, 50·97, in every 100 parts. The solids are composed of silica, ferric oxdyi, calcic sulphate, calcic carbonate, magnesic carbonate, magnesic chloride, and sodic chloride. The temperature of the principal Spa was taken August 31st, 1874, and September 29th, 1874, on both of which occasions it stood at 2·1 and a fraction centigrade. A variation to the extent of ·3 was observed between the first and second readings, that of the last-mentioned date being highest. Efficacy is claimed for these waters in the treatment of cutaneous diseases, chronic gout rheumatism, palsy, stiff joints, scrofula, and consumptive diseases. Thanks are due to Messrs. Plunkett and Studdert for their carefully drawn up report.

Another vendor in England of "Castor-oil Pills" made from calomel, rhubarb, and other purgatives, but without a trace of castor-oil, has been fined in a penalty with costs amounting to £14 9s. for the fraud. The defence was the usual one, *i.e.*, that the pills were as good or better than castor-oil, but the Bench did not recognise the relevancy of that question to the charge against the prisoner.

Typhoid Fever in Edinburgh.

About a week ago information was communicated to Dr. Littlejohn, medical officer of health for Edinburgh, with reference to a serious outbreak of typhoid fever at Coltbridge and other districts in the west end of the city, which it was believed had been caused by means of milk sold at a dairy in which a person was suffering from fever. The medical authorities have inspected the place, and had notices served on the occupant of the dairy, as well as on that of another, the sanitary arrangements of which were not in a satisfactory condition, to have them put right. The *Scotsman* understands that the retailers of milk in Edinburgh who were supplied by the dairies referred to have been advised by Dr. Littlejohn to discontinue their supply in the meantime, and that this recommendation is to be acted upon. At present over twenty families in the district are suffering from the fever. Several cases have been attended with a fatal result.

Dr. B. W. Richardson in Dublin.

The first of the lectures by Dr. B. W. Richardson of London, on "The Science of Temperance," will take place on to-morrow evening—Thursday—the chair being occupied by the President of the College of Physicians. The visit of this eloquent lecturer to Dublin is an event of some importance, especially in its relation to the effort made last session in Parliament to check Sunday drunkenness. It is expected, that the profession will muster in force to hear him.

Determination of Albumen in Urine.

According to J. Stolnikow, urine containing albumen is diluted with water, until a sample poured upon some nitric acid contained in a test-tube still produces a faint white ring at the point of contact, after a lapse of forty seconds. The number of volumes of water added to the volume of the urine (which may be taken as one) is divided by 250, and the quotient will be the percentage of albumen in the urine. This relation has been established and confirmed by gravimetric determination.

Palpitation of the Heart.

Dr. Lardies, in *L'Union Médicale*, describes a method by which palpitation of the heart not due to organic lesions may be arrested at once. The patient is directed to bend the body head down, with the arms hanging so as momentarily to cause coongestion of the upper part of the body. In all cases of nervous or anæmic palpitations the heart quickly resumes its normal functions. If respiration be arrested for a few seconds while the patient is in the above position, the relief is still more speedy.

The British Medical Association, not having received an invitation from any of the large towns in the United Kingdom to hold their annual meeting in 1878, the Council have applied to the Mayor and Corporation of Portsmouth to receive them. As, however, such a reception would tax the ratepayers to the extent of several hundreds of pounds, the Mayor has deferred giving an answer until he shall have consulted with his colleagues.

Child-Poisoning by Opium.

THE administration of narcotics to children—so common amongst the lower orders in England—resulted last week in two deaths—one in Devonport from the effects of a chemist's prescription, and the other in Liverpool, from "Steedman's Powder." The public might remember with great advantage that one death under these circumstances is equivalent to hundreds of cases of illness arising from the same cause, but which never see the light.

Fixed Oil of Stavesacre.

THIS is a specific parasiticide for pediculus capitis, p. corporis, p. pubis, and acarus scabiei. Mr. Balmanno Squire first used an ointment prepared from the seeds, but, owing to its unsightliness, later selected the oil of the seeds, extracted by ether or better by simple expression. It is colourless and odourless, and non-irritant, an impotant advantage it possesses over sulphur in the treatment of itch.

Diphtheria in Lowell in 1876.

THE report of the Massachusetts State Board of Health says that the year 1876 was a memorable one for Lowell, because in it the city has been visited by the most fatal epidemic ever known in its history, there being in all 231 deaths.

Bichromate of Potash as an Antiseptic.

M. LAUJORROIS lately presented a note to the French Academy, on the antiseptic properties of bichromate of potash. Experiments had shown him that the addition of one-hundredth part of bicromate in ordinary water prevents the putrefaction of all sorts of organic matter, such as meat, urine, &c. A thousandth part of bichromate prevents beer from turning sour. After three months' immersion in a solution, meat was hardened and dry.

Simple Method of Testing the Purity of Chloroform.

DR. LUEKE, of Strasbourg, gives the following simple method of testing the purity of chloroform :—Immerse a small piece of thin white blotting paper into the chloroform, and then let it dry in the air. As soon as all the chloroform has evaporated, the paper will not present the least smell if the chloroform is pure. If there is any acid smell perceptible, it indicates the presence of butyric acid in the chloroform, and as a rule has the strong characteristic odour of that substance.

ACCORDING to the latest famine report in the Bombay Presidency there were 264,314 persons employed on relief works, an increase of 13,000 during the week. The fund at the Mansion House in aid of the Famine Relief Fund has already realised the handsome sum of £130,000, to which Dublin, Belfast, Bristol, Liverpool, Cork, Manchester, &c., have contributed largely.

LAST week at Glasgow Dr. Summerhill, Superintendent of the Maternity Hospital, was committed for trial for a breach of the Anatomy Act. The case arose out of the alleged cruel treatment of a patient named Flora Macdonald and the dissection of her infant.

PROFESSOR ERASMUS WILSON, at whose expense Cleopatra's Needle is to be brought to England, has received telegraphic intelligence of its safe launch on board the ship which is destined—accidents excepted—to bring it to these shores.

SCIENCE has lost a great man by the death of Joseph Bienaimé Caventou. In 1820, together with Pelletier, he discovered quinine, one of the most valuable remedies that has been contributed to the repertory of pharmacy.

WE understand that Sir Thomas White, Lord Mayor of London, has declined to fill the vacancy caused by the untimely death of Sir Francis Hicks, as Treasurer to St. Thomas's Hospital, in consequence of his official duties.

WE learn that the presidential address at the opening of the Homœopathic Medical Congress to-morrow at Liverpool, will be devoted to discussing "The cause of Professional Opposition to Homœopathy."

"ALL is not gold that glitters" at the seat of war as some of our surgeons have found to their cost. But considering the uncivilised warfare that for the most part has been carried on, they have not as a whole fared badly. The valuables however, of Surgeon Weller, appear to have attracted the kind attention of some Turkish irregulars who, on Sunday last surrounded him, and quietly relieved him of all that was movable.

WE understand that Dr. Sayre, our distinguished American *confrère*, who has been in Ireland for a short time, has consented to give a Demonstration of his Method of Treatment of Defotmities, in the Operating Theatre of the North Cork Dispensary, at twelve o'clock on Tuesday next.

WE recently commented upon the case of Dr. Deville, *versus* the Harrogate Commisioners in which, as Medical Officer of Health, he was peremptorily dismissed from his post without the usual quarter's salary, for refusing to apologise for having read a paper at a medical meeting which reflected upon the neglect of certain sanitary measures by the said authorities. Dr. Deville took the case into the law courts and was successful, but the customary *bete noir*, law expenses followed, and he was mulcted into £150 costs, rather a heavy fee for upholding the dignity of the profession. To meet this Mr North, president of the Yorkshire Association of Medical Officers of Health, has started a Fund, and we are glad to learn that he has already received about half the amount, which we trust will be considerably augmented before the Fund closes.

Mortality Statistics of Foreign Cities.—The annual rates of mortality, according to the most recent weekly official returns, were, in Calcutta 24 per 1,000 of the population, Bombay 54, Madras 142, Paris 24, Geneva 22, Brussels 23, Amsterdam 22, Rotterdam 25, The Hague 22, Copenhagen 21, Stockholm 28, Christiania 20, St. Petersburgh 35, Berlin 35, Hamburg 30, Breslau 38, Munich 31, Vienna 23, Buda-Pesth 41, Rome 20, Naples 22, Turin 21, Venice 26, Alexandria 39, New York 31, Brooklyn 27, Philadelphia 23, and Boston 27.

Correspondence.

HYDROPHOBIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As my name has been mentioned by "A Surgeon," in your issue of the 5th inst., in connection with hydrophobia, permit me to make a few remarks in reply to his observations. The latent or incubative period of this disease is very indefinite, more so, perhaps, than that of any other malady with which we are acquainted, the interval varying from a few days to months, and even years. In my work "Rabies and Hydrophobia," p. 165, I have entered fully into this subject, and have given statistics relating to the incubation period of hydrophobia in mankind and animals, as well as the facts which support the above assertion.

The *Daily Telegraph* erred in attributing to me the statement, that when the disease appears after a long interval has elapsed, it is not true rabies, but nervous tetanus or mental hydrophobia.

The statement is not mine, but that of Trousseau, whom I quoted in my work. I do not believe in the existence of mental hydrophobia. It is utterly impossible for any human being, and particularly if he had never seen a case of this disease, to simulate or imitate the symptoms. They are beyond simulation or imitation. For the same reason I do not believe in mental tetanus. The number of animals which perish from rabies every year, the result of inoculation, is far greater than that of mankind. Can we attribute their disease to imagination? And what about children and young people whose mind cannot be so vividly impressed by a slight scratch or bite?

Hydrophobia is largely on the increase in this country, owing to causes which we need not here specify, and none of the deaths, so far as I can ascertain, have been of persons who were not inoculated with the saliva of an animal susceptible of rabies. Mental hydrophobia could surely occur without the intervention of a rabid animal. Mental anxiety may lead to an earlier development of the disease after inoculation, but not always. I have known of many persons wounded by really rabid dogs, who suffered months of miserable torture and suspense, but did not become hydrophobic. I have myself been inoculated and kept in an unhappy state for a long time.

My opinion, therefore, is that real hydrophobia is not a mental disease any more than is tetanus, but is a specific inoculable malady, which we can produce at will, and experimentally in a certain percentage of animals purposely inoculated with the saliva of a rabid animal. There is a *pseudo*-hydrophobia, but I have never known it to be fatal, and the symptoms are widely different. It is produced merely by fear, and can be readily allayed by tact and judicious management. Real hydrophobia is always fatal.

I am, Sir, yours respectfully,

GEORGE FLEMING, F.R.C.V.S.
Veterinary Surgeon, 2nd Life Guards.

MATICO IN POST-PARTUM HÆMORRHAGE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR

SIR,—In page 170 of your issue of August 29th, I noticed the remarks of Mr. E. Martlett Boddy, F.R.C.S., &c., on the utility of matico in post-partum hæmorrhage. In contrasting the action of this drug with that of the perchloride of iron, in certain cases, he evidently claims a superiority for matico on the grounds of the perchloride "having been known to cause a fatal termination," remarking, at the same time, that "nothing of a pernicious nature *could possibly ensue* from an injection of the infusion of matico." Admitting the fact that the perchloride has terminated fatally, I am inclined to ask Mr. Boddy whether the result was not due more to the bungling of the surgeon in attendance than anything else? And with regard to his remark to the effect that the injection of the uterus with an infusion of matico "*could not* possibly terminate fatally," it must pass for what it is worth, as we all know that death from peritonitis has, on more than one occasion, followed the injection of fluids altogether innocuous. Matico, or its tincture, of which the following is the composition, and mode of preparation: "matico in coarse powder three ounces; proof spirit, twenty fluid ounces: marcerate for fourteen days, strain, express, and filter;" this preparation could, in my opinion, be more successfully employed in cases of external hæmorrhage, as for instance from leech-bites, incisions, &c. Indeed, it is my belief that it is only in such cases that matico itself is of the slightest avail, as its action is altogether of a *mechanical* nature. If such, then, be the case with regard to the plant, I cannot reasonably see how the tincture or infusion could have the slightest control over such hæmorrhages as are consequent on the relaxation of the fibres which close the blood-vessels of the uterus. In these cases (at least in as many of them as I have seen) the blood pours forth with an impetuosity which is most appalling. Should such cases be tampered with? Would any practitioner be justified, in such a case, in resorting to an agent which is altogether devoid of the properties of a *true* styptic? Should he not rather follow up the advice of Barnes, and use *iron*, the hæmostatic effect of which, he says, is produced in three ways: "first, there is a direct action in coagulating the blood in the mouths of the vessels; secondly, it acts as a powerful astringent on the inner membrane of the uterus, stongly corrugating the surface, and thus constricting the mouths of the vessels; thirdly, it often provokes some amount of contractile action of the muscular wall?" Iron, after the manner recommended by the same able writer, is the material which I have been instructed to have recourse to; iron is the great favourite styptic. Such have I seen Dr. Brice Smyth, Belfast, resort to, on more than one occasion, with the happiest result. He simply carried out the designs of Barne, and I am certain (in these cases at least) that the slightest deviation from that course, or an adoption of any other mode of treatment, would have ended disastrously to his patients, and acted in a manner detrimental to his high-standing reputation as an obstetrician, as death would have been the inevitable result. Hoping you will give this a place in your next issue,

I remain, yours, &c,

ANDREW JAMES BLAIR,
Medical Student.

Sept. 1st 1877.

THE NERVOUS ORIGIN OF HYDROPHOBIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Can you tell me whether hydrophobia can result from a diseased imagination, or is there such a thing as spontaneous rabies? I can quite imagine such a theory possible, and as we have mania, melancholia from exciting causes as grief, trouble, religion—purely mental unsubstantial ideas reacting on weak imperfectly formed brains—so the bite of a healthy dog, or even without a bite the dread of being bitten, might develop the train of horrible symptoms we call by the above name.

The nervous construction is very complex, producing fear, hate, pleasure, love, anger, and all forms of emotions. Now they are all dependant on external impalpable influences of various kinds, and I should like to know whether we can assign all the passions and emotions to the same set of nerves.

A man may imagine himself Jesus Christ, a woman may imagine herself doomed to death from committing the unpardonable sin, and without any lesion externally, I have seen a young woman in the seeming possession of health, droop and fade like a plucked flower, and die from the result of a mental idea. We have all heard of woman, pining and going mad from unrequited love. The roses have faded from the cheek, the hitherto active powers of mind have withered, languor, indifference, apathy, have taken the place of activity, energy, spirit, and with as much certainty as if a poison, of a palpable determined agent had been introduced like virus, so do such patients collapse. I am not drawing on my imagination—these are facts. Are they medical heresies?

Yours faithfully,

ONE IN DOUBT.

Leicestershire, Aug. 30th 1877.

THE (SO-CALLED) HOMŒOPATHIC SCHISM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Since you are good enough to offer me space to reply to Dr. Wyld's letter in your last issue, allow me first to say that I perfectly agree with you in your remarks as to Dr.

Wyld in your editorial comment appended to his letter. Dr. Wyld and the party he represents, have the most perfect right to abandon the name of the medical system which they have practised for years, if they see fit to do so, but I do not see how this is to effect a union between those who have studied and who practise homœopathy, and those who have not studied it, and consider an avowal of a belief in its tenets a sufficient reason for expelling any physician or surgeon from communion with the profession at large.

The view I take is, that the only firm basis of union is, *to prove ourselves in the right.* I do not blame that conservatism on the part of the profession which induces resistance to our revolutionary theory and practice. It is for us to overcome the opposition by counter-opposition, and I do not so far underrate the intelligence nor the manliness of the profession at large, as to credit them with absolute and wilful deafness and blindness. Sooner or later, if we are speaking the truth, and if we are practising what is true, our theory and practice will win its way, and then we shall be received into those Societies, Hospitals, Schools, &c, which now reject us. I chiefly blame the want of public spirit by which the leaders in Homœopathy have neglected its public teaching, as the cause of the treatment to which we have been subjected by the profession. When, during fifty years, no public courses of instruction, practical and theoretical, have been provided, when a certain amount of mystery exists in the practice of Homœopathy, through the practice of giving medicines out of a pocket-case, in place of writing prescriptions, what was to be expected? For my own part I carry no pocket-case; I invariably write prescriptions, and do so in English; and we now are endeavouring to form a school of Homœopathy, in which our whole system, theoretically and practically, will be laid open to the freest criticism. I may be wrong, but I do not for a moment believe that our ostracism comes from our use of the term Homœopathy or Homœopath. I credit the profession with more sense; nor do I conceive that we are ostracised because our practice is believed to be unsound. Men holding opposite views, on almost every point in medical science, have been allowed the freedom of their opinions; I conceive it is from a disbelief in the honesty of our practice that we are excluded, and this has resulted partly from the mystery of the pocket-case, and partly from the want of earnest public teaching on the part of our leaders.

In direct reply to Dr. Wyld's last letter, I have only two points to notice—one, that in paragraph four, he quotes a misprint, and argues that I am illogical when I am made to say, "he both claims and *avoids* liberty of action" instead of "accords" which is what I wrote; and secondly, I can only express my surprise that Dr. Wyld should charge me with mis-statements. In the P.S. to my letter of August 25th, every one of the three statements in that P.S. I am prepared to substantiate, but it would take more time than I am inclined to devote just now to the task, and more space than you would be able to give me, were I to do so "*in extenso!*"

Thanking you for your courtesy.

I am, Sir, yours faithfully,

WILLIAM BAYES, M.D.

[This correspondence must now close.—ED. M. P. & C.]

Mortality Statistics of the Past Week.—During last week 5,748 births and 3,327 deaths were registered in the 23 large towns of the United Kingdom. The natural increase of population was 2,421. The mortality from all causes was at the average rate of 21 deaths annually in every 1,000 persons living. The annual death-rate per 1,000 of the population was, in Sheffield 18, London 18, Edinburgh 19, Plymouth 20, Portsmouth 20, Bradford 21, Leeds 21, Dublin 21, Glasgow 22, Bristol 22, Oldham 23, Norwich 24, Manchester 24, Newcastle-on-Tyne 24, Nottingham 24, Liverpool 25, Sunderland 26, Wolverhampton 26, Birmingham 27, Hull 27, Brighton 30, Leicester 33, and the highest rate 38, in Salford. The annual death-rate from the seven principal zymotic diseases averaged 5·5 per 1,000 in these towns, and ranged from 3·5 in Oldham, to 11·6 and 13·7 in Hull and Salford. Diarrhœa showed exceptional fatality in Leicester, Hull, and Salford. Scarlet fever caused 8 deaths in Wolverhampton, where the annual death-rate from this disease averaged 4·5 per 1,000 during July and August. Small-pox caused 23 deaths, of which 20 occurred in London, and 3 in Liverpool.

NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—The Publishers will be glad to receive the subscriptions for the past year, 1876—£1 2s. 6d., at either of the offices in London, Dublin, or Edinburgh.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

TREPHINE.—Cerebral localisation may be utilised as a guide for the use of the trephine, at least, French surgeons say so. M. Lucas-Championniere, M. Broca, MM. Proust and Terrilon have operated on indications from the above. The patient whom M. Tillaux recently opened an abscess of the brain died three days after the operation. At the *autopsy* four abscesses were found in different regions of the brain; the one punctured by M. Tillaux corresponded with the foot of the second and third occipital convolutions.

JUROR'S HEALTH CERTIFICATES.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Some weeks ago I wrote a certificate for a patient of mine stating he was under my care, and that were he to leave his house to attend on a jury it would be dangerous to his life. My patient's son took the certificate to the Clerk of the CROWN, who first compelled him make his affidavit that what I stated was true, and then refused to present the certificate to the judge unless he got six shillings. The young man refused to pay it, and the consequence was, in the face of my certificate and the young man's affidavit, the gentleman was fined £2. On the gentleman protesting, he got his option either to give six shillings to the Clerk of the Crown or pay the fine. He paid the six shillings and got off paying the £2 fine.

Now, Sir, what would you recommend to be done in this matter? If our certificates are to be dishonoured in this manner, what do we gain by paying to become registered practitioners?

Yours,

ORIEL.

[It seems to us that the juror was fined—not from a disbelief in his incapacity to serve—but because he did not pay the 6s. Why an inoffensive citizen should be mulcted in 6s. for leave to excuse himself for being sick is one of the incomprehensibilities of the law. We hope our correspondent may never have occasion to be acquainted with legal practices of this sort. If he should be so unfortunate he will speedily discover that his friend the juror had a happy escape in being bled only of 6s.—ED.]

CANTATOR.—We do not trust such reports, but we do trust that Mdme. Tittiens will again charm us. There was some mystery about the decease of Mdme. Malibran. Dr. Bardsley was unceremoniously discharged, fresh medical attendance secured, and a considerable amount of dissatisfaction was expressed by the Profession at the time.

DR. H., Leeds.—We hardly think we can assist you; every practitioner may, if he likes, open a provident dispensary, but the profession itself can very easily mark its disapproval of an individual's conduct in the usual way. Dr. Clifford Allbutt can hardly suffer very much, for we imagine his patients would soon find out their mistake. The handbill is simply abominable. If the name of the member for Leeds is on the list of patrons he should at once strike it off.

ALCOHOL.—Tardieu wrote many years ago on the effect of alcoholism in modifying the cure of wounds, &c., so that the views are not new.

STATISTICS.—In the section of economic science at the late meeting of the British Association Dr. Farr took the subject of population and its increase. He is not in favour of French practices. Names are only relatively valuable, you know, "Homer sometimes nods."

MR. E. SMITH, Kettering.—The gentleman referred to is still in practice.

PRIZEMAN.—The prize has been awarded to MM. Eulenberg and Guttman, and probably it will become a question for legal authorities to settle whether, under Sir Astley Cooper's will, such an award is legal.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Are appointments to dispensaries or workhouses difficult to obtain in England?

Is there as much competition as in this country for such?

Does England or Ireland offer the best facilities (to young men willing to work) for rising in their profession?

Answers to the above will much oblige

Yours faithfully,

HIPPOCRATES.

[The competition in England is not so keen as in Ireland, because the appointment is worth much less, being really of little value except as a *nidus* for local practice. Moreover, special qualifications are requisite, inasmuch as the London "College and Hall" licenses are usually a passport to the appointment. An English workhouse is hardly within the scope of Irish competitors.—ED.]

THE CONTAGIOUS DISEASES ACTS.—Mr. Thos. Worth, M.R.C.S., of Nottingham, writes to us in reference to a paragraph which appeared in a recent issue that "no authenticated case of interference with respectable women under the working of these Acts had come to our knowledge." Mr. Worth points out that such instances have occurred: one is mentioned in the Report of the House of Commons Committee, in which a woman was suspected by the police, and, upon examination, her virginity was fully established. He also sends particulars of another case which occurred at Chatham in January, 1876, where a girl of 18 was suspected, and, because she refused examination, was forcibly detained and treated with great indignity for a fortnight. As the only means of regaining her liberty, she at last submitted, and, upon the careful examination of two surgeons, she also was found to be a virgin. Our correspondent expresses himself in indignant terms of the Acts, under which, he says, "the whole female population is practically outlawed."

MR. BOOTH.—We have been unable as yet to get the information wanted.

MR. BURGESS.—Thanks, we fear, however, that we shall be unable to give the necessary space.

AN EDITOR.—You will find the subject referred to in our issue for August 29.

VACANCIES.

Baltinglass Union, Rathvilly Dispensary.—Medical Officer. Salary, £120. Election, Oct. 8.

Bradford General Infirmary.—Resident Surgeon. Applications, with testimonials, to the Chairman of the Weekly Committee, on or before the 27th inst.

Bristol General Hospital.—Physician's Assistant. Salary, £50, with board, &c. Applications to the Secretary by the 21st inst.

Edinburgh University.—Examiner in Chemistry. Applications for the appointment to be lodged before October 1st with the Secretary.

Granard Union, Granard Dispensary.—Medical Officer. Salary, £120. Election, 22nd inst.

Granard Union Workhouse.—Medical Officer. Salary, £120. Election, 24th inst.

Kent and Canterbury Hospital.—Assistant House Surgeon and Dispenser. Salary, £50, with board and lodging. Election, 21st inst. Apply to the Secretary.

North Devon Infirmary, Barnstaple.—House Surgeon. Salary, £100, with board and lodging. Election, Oct. 2. Certificates, &c., to the Secretary.

Northumberland County Lunatic Asylum, Morpeth.—Assistant Medical Officer. Salary, £100, with board, &c. Apply to the Medical Superintendent by the 13th inst.

Parsonstown Union, Ferbane Dispensary.—Medical Officer. Salary, £120. Election, 20th inst.

Royal Free Hospital, London.—An Assistant Physician and an Assistant Surgeon on the staff. Both Honorary. Full particulars of the Secretary. Election, 19th inst.

St. Mary's Hospital, Paddington.—Pathologist and Medical Tutor. Salary, £100. Full particulars of the Dean. Latest day, 24th inst.

Westminster Hospital.—House Surgeon, and an Obstetric Assistant. Board and lodging provided, but no salary. Address the Secretary by the 15th inst.

APPOINTMENTS.

ATKINSON, J., L.R.C.S.I., L. & L.M.K.Q.C.P.I., Medical Officer to the Killala Dispensary, Killala Union.

MCNULTY, J., L.R.C.S.I., L. & L.M.K.Q.C.P.I., Medical Officer to the Killala Union Workhouse.

STACK, R. T., M.D., M.Ch. Univ. Dub., L. & L.M. R.C.S.I., Dental Surgeon to the Dental Hospital of London.

WHITBY, P. J., L. & L.M. R.C.S.I., L.K.Q.C.P.I., Medical Officer to the Ullid Dispensary, Waterford Union.

Births.

ADAM.—Sept. 6, at Caterham, Surrey, the wife of J. Adam, M.D., of a son.

DUPRES.—Sept. 6, at 17 Pentonville Gardens, Kensington, the wife of Dr. A. Dupré, F.R.S., of a son.

M'IVER.—Sept. 2, at Cookstown, the wife of William M'Iver, M.D., of a son.

Marriages.

INGHAM—KENT.—Sept. 4, at St. Mathew's, Rugby, the Rev. E. G. Ingham, M.A., to Josephine, widow of B. A. Kent, M.D., late of St. John's Park, Isle of Wight.

SHAPTER—BAYLY.—Sept. 3, at St. Sidwell's Church, Exeter, Lewis Shapter, M.D., of Barnfield, Exeter, to Charlotte Bayly, youngest daughter of Capt. E. Bayly.

Deaths.

CARR.—On Sept. 1, at Effingham House, Leamington, Jabez Carr, M.R.C.S., L.S.A., aged 66.

DUKES.—On Sept. 4, at 52 Marquess Road, Canonbury, Arthur E. Dukes, youngest son of E. Dukes, M.R.C.S.

GULLAND.—On Sept. 2, at St. Heliers, Jersey, Olivia, wife of Surgeon-Major Gulland, M.D.

SCOTT.—On Aug. 28, at 27 India Street, Edinburgh, William Scott, M.D., Surgeon-Major, late Madras Army, aged 60.

YORKE.—On Aug. 27, at Granard, co. Longford, Christopher Francis Yorke, M.D., aged 42.—R.I.P.

Established 1848.

PROFESSIONAL AGENCY AND MEDICAL TRANSFER OFFICE,

50 LINCOLN'S INN FIELDS, W.C.

J. BAXTER LANGLEY, LL.D., M.R.C.S., F.L.S.

&c. (KING'S COLL.), and Author of VIA MEDICA, &c.,

AND

J. GEOFFREY LANGLEY, M.B. (London), M.R.C.S

Dr. Langley has always upon his books a large number of desirable Investments and available Appointments for negociation.

The business of the Professional Agency is based upon the general principle, that no charge is made unless work has been done and services rendered.

No Commission charged to Purchasers.

Full information as to terms, &c., sent free on application.

Office hours, from 11 till 4; Saturdays excepted.

COMPETENT ASSISTANTS provided without expense to principals. No Gentlemen recommended whose antecedents have not been inquired into.

LOCUM TENENS.—Dr. Langley has now organised a thoroughly reliable Staff of suitable Gentlemen to take full Charge of any Practice which may require it in the absence of the principal, at fees from £3 3s. 0d. upwards, according to age, experience, qualifications, &c. One of these gentlemen can be despatched by an early train after receipt of telegram or letter stating duties and terms. Office fee 10s. 6d., payable by the principal.

PRACTICES AND PARTNERSHIPS NOW OPEN for Negociation (in addition to those advertised in Dr. Langley's List, which is sent post free on application).

A 418. In a charming Inland Watering Place in the West of England. A gentleman holding an increasing Practice desires to secure the co-operation of a doubly-qualified Partner, accustomed to good society. Receipts are £840 a year, and there is no opposition within 8 miles. No midwifery under £1 1s. Very easily worked appointments are connected with the Practice. A Third Share is offered with succession to Half as may be arranged. Terms based on 2 years' purchase.

A 417. Old established FAMILY PRACTICE on the South Coast. Receipts, £750 a year. Appointments, £150. To a gentleman willing to receive resident patients this investment is particularly eligible, as the house is large, and there are grounds attached. The Successor should be a Conservative and a Churchman.

A 416. First-class NUCLEUS in a Pleasant little Town in the West of England. Average receipts, £300 a year, with great scope for increase. Transferable appointments yield £200 a year. All expenses small. No horse required. Very little midwifery.

A 415. Near LONDON, with easy access by rail, an Old established PRACTICE, realising £600 a year, and capable of considerable extension. Midwifery, chiefly £1 1s. to £5 5r., visits, 2s. 6d. to 10s. Large family residence, with extensive garden, field, stabling, &c. Rent, £40. Pop., 9,000. Only one opponent. The Incumbent not being in good health has not actively pushed the practice of late years.

A 414. In the EAST. The Succession to a large and very profitable PRACTICE in British India is open for negotiation. It is situate in a remarkably healthy seaport town, with an extensive European commerce. The receipts vary from £1,900 to £2,500 a year, and are verified by the certificates of the local magistrates. References can be given to medical men in large practice in England who are personally acquainted with the place and practice. A knowledge of European languages is desirable. Easy terms would be conceded to a suitable gentleman, but no one without £750 at command need communicate.

A 412. Within 40 miles of London, with direct rail, a high class COUNTRY PRACTICE realising £3,000 a year. Appointments, £230. Large house in a commanding situation, with convenient premises. Introduction for 12 months if desired.

IRISH POOR-LAW INTELLIGENCE.

ABBEYLEIX UNION.

DURROW DISPENSARY.

THE hon. sec. forwarded minutes of the meeting of the committee on the subject of Dr. Palmer's leave of absence and the payment of his substitute. Six members of the committee attended the meeting, and it was unanimously resolved, "That three weeks' leave of absence be granted to Dr. Palmer from the 20th ult., he undertaking that his place shall be supplied during said period by a properly qualified officer residing in the town of Durrow."

A resolution was proposed that Dr. Palmer's substitute be paid £2 2s. per week out of the union rates; but the motion on a division was rejected.

A FRACTURE IN A LUNATIC.

RECENTLY, a girl, named Beatty, labouring under mental derangement, was sent from the Enniskillen Workhouse to Omagh Asylum. She had been very violent in the workhouse, and had to be kept under restraint by a strait waistcoat. She had previously, about four years ago, been in the County Infirmary for a broken leg, but it had been healed. From the preliminary inquiry before the guardians, it appeared she had been able to run about the place. The next morning she lay in bed in her ward The matron noticed her leg swollen, and she had to be carried. The doctor did not examine her for a broken leg, as she was so unruly they could not do anything with her; and he told the Board that it confirmed his view that the workhouse was not the place for such patients. Acting on the doctor's recommendation the girl was sent to Omagh Asylum on the 18th, in charge of the porter and three other persons. The mother of the girl had been anxious to see her whilst she was in the house, on several occasions, but as it was always found she became worse after such interviews, the guardians, at the suggestion of the doctor, gave orders prohibiting them. The girl was quiet during the transit to Omagh, and was again carried to the cab there, and brought to the asylum. The mother attended at the Enniskillen guardians and rather upbraided the Board for not letting her have her child out of the workhouse. The guardians interrogated the doctor of the house, the matron, and the hospital nurse at great length, but none of them knew that she laboured under a broken leg when being sent to the asylum; and as Dr. West's letter did not make it clear whether it was the old fracture that had been re-broken—which the patient's own violent conduct while under restraint in the work house might have effected —or whether it was a fracture of the other leg, the Board decided on authorising the Clerk to write to the resident medical superintendent of the asylum.

DONOUGHMORE UNION.

PAYMENT OF OFFICERS ON LEAVE.

MR. RUDD moved "that all officers of this union seeking leave of absence for amusement or otherwise, do pay their substitutes while taking such leave, and that each and every officer be held responsible for the faithful discharge of the duties attached to the office." He proceeded to say that he could not be accused of having brought on this motion behind the backs of any guardians, inasmuch as notice of it had been given that day four weeks. The considerations involved in it were of no special moment to himself, neither was the motion directed at any one officer in particular. The ratepayers were crying aloud why he and the other guardians permitted their officers to be paid twice. They were already paid large amounts each; they ought to be satisfied with them and pay their own substitutes when they went on leave for pleasure or amusement. This system of paying substitutes was not practised in any of the surrounding unions of Abbeyleix, Mountmellick, or Roscrea, and he hoped the guardians by their votes would put an end to it here to-day, and not allow the ratepayers to be unnecessarily taxed.

Mr. Walpole—The statement about Abbeyleix union is not correct. I know of my own knowledge that when the medical officer there got leave his substitute was paid by the board. In other unions it is quite a common thing to pay substitutes, and I think the rule we have always followed ourselves should be left as it is, and the cases when they come before us decided according to their merits. The speaker concluded by moving an amendment to that effect.

The board then divided, when there appeared for the motion, 6; against, 5. The motion was therefore carried

The Chairman in recording his vote for the motion, said he thought it was a great hardship to ask the ratepayers to pay for substitutes, except where their officers were compelled through ill-health to seek leave.

Mr. Walpole—That is exactly my view. I think when one of our officers gets sick we should pay his substitute.

LIMERICK UNION.

A DISINFECTING CHAMBER.

A LETTER was read from the Local Government Board urging the necessity on the Board to erect a disinfecting chamber in the workhouse.

Dr. Sullivan said he advocated the necessity of such when the matter was under discussion before. It was then proposed that the Board of Guardians and the Corporation should unite in erecting a disinfecting chamber; he (Dr. Sullivan) had, on several occasions, waited on the Rural Authorities but nothing practical had resulted. He would now propose the erection of a disinfecting chamber solely for the use of the workhouse.

Ald. Myles said chloride of lime and sulphur had

served the use of a disinfecting chamber before. If it were cheaper why should it not be used now?

Dr. Sullivan withdrew his proposition for the present.

A LUNATIC FEVER CASE.

Ald. Myles said an old woman was admitted while in a state of lunacy into the fever hospital by Dr. O'Kelly, the resident medical officer, a few days ago. She was subsequently removed to the Limerick Lunatic Asylum by the order of Dr. O'Connor, one of the visiting physicians. The woman was from Clare, he asked to have the woman sent to the Clare Lunatic Asylum.

Dr. O'Kelly said there was a mistake in the matter, but at the time he believed he was acting properly. The woman was brought to him in a feverish condition, also suffering from mental excitement. He was told that she had been seen by two doctors who diagnosed her case as fever, and at the time he thought he was acting prudently.

Dr. O'Sullivan said he hoped such a state of things would not be allowed to continue. It was a serious thing to do—to admit a lunasic into a fever hospital.

The Chairman held it was a mistake which might happen to the most skilled medical man.

LIMERICK DISPENSARY.

Dr. Gelston—The sub-sanitary officer came to us yesterday and stated that he had been ordered by the Urban Sanitary Authority to call upon us once a week for a list of the names of people labouring under infectious diseases. Are we to furnish such a list?

Mr. Holmes—It is very unfair that the houses of the poor can be entered by the sub-sanitary officer and the houses of the rich passed over.

Dr. Gelston—I must decline to give the names of persons labouring under infectious diseases. In private cases I will give no information whatever.

Mr. Lenihan—Why should the duty be imposed upon the doctors, I don't think there is anything in the Act of Parliament to authorise such an order. To call on the doctors to furnish such information would be to impose upon them duties of a domiciliary and very obtrusive character.

Dr. Gelston—Dr. Carey as well as myself and Dr. Holmes, wish to have the order of the dispensary committee as to whether we should give the names of the poor people who come to us for medical advice. In private cases I'll give the Sanitary Board no information whatsoever.

Ald. Myles—We have no authority to interfere with anything which emanates from the Sanitary Board.

Dr. Gelston—It is from the books of the dispensary that the information is to be furnished, and this committee can in my opinion direct whether we shall give the information or not.

Chairman—This committee will give no directions on the subject.

Ald. Myles—Apply to the Local Government Board for advice.

Mr. Lenihan—The Act of Parliament ought to be consulted and if there is no authority for the order of the Sanitary Board we should direct our officers not to give the information asked for.

Dr. Gelston—On my own responsibility I'll refuse to give Berret any information. I don't see what right he has to come to us to get the names of any party.

Mr. Lenihan—I have heard the city is extremely healthy.

The committee made no order in the matter.

CROOM UNION.

Dr. J. Hartigan, medical officer to the workhouse, applied to have two infirmary wards disinfected, and a disinfecting chamber to be erected for the purpose of disinfecting patients' clothes.

The Master (Mr. Carroll) regarded the proceeding as unnecessary, and thought that the application of the doctor would lead the public to believe that the wards alluded to were in a filthy condition.

Dr. Hartigan—No, indeed, the public will not think so. It is usual to do this at times, and the wards have not been cleansed since I came here.

The Master—I beg to differ with you, Doctor, the wards are cleaned.

Dr. Hartigan—Disinfected is it?

The Master—No but they are washed out once a week, and cleaned up every day in addition.

Dr. Hartigan—When I was in Dublin the hospital ward was often disinfected.

The Master—Yes, when any infectious disease was in the house.

Dr. Hartigan—Were patients' clothes ever disinfected here Mr. Carroll?

The Master—No, for when a patient was going out, his, or her friends always brought clean clothes for them and took away the other clothes.

Dr. Hartigan—I remember a case of a young girl coming in some time ago having diphtheria, some of her clothes were burnt, while the remainder were disinfected. And when people take out the clothes of a patient having an infectious disease they merely give them an airing before the fire and wear them again.

The Master said he was not aware that they did so with them.

Chairman—I will make an order that the Master and Doctor will get the ward disinfected.

Dr. Hartigan—Every case in the hospital is infectious—even sore eyes, erysipelas, and bed sores, are all infectious.

Chairman—Atmospheric influence has a great deal to do in these cases too.

Dr. Hartigan—Most assuredly, sir.

It was ultimately decided that the wards be disinfected under the supervision of the Doctor and Master.

KILLALA DISPENSARY

ELECTION OF MEDICAL OFFICER.

At a special meeting of the Committee of Management, there were three applications from Dr. Henry Mark Scott, Dr. Joseph Atkinson, and Dr. John McNulty. The first is medical officer of the Easkey Dromore West; the second acting medical officer of the Killala dispensary and workhouse since Dr. Handy's decease, and the third is medical officer of Adragolle, Castlebar union.

Chairman—Does any person propose Dr. Scott?

Sir C. Gore proposed Dr. Scott.

The nomination was not seconded, and the votes were taken for the other candidates with the following result:—

For Dr. McNulty, 4; for Dr. Atkinson, 12.

The Chairman, before declaring Dr. Atkinson elected, wished an expression of opinion from the committee upon a subject which had been previously discussed by some of the members. It related to the payment of the person acting for the medical officer while absent from his district on sick or other leave. It was the opinion of quite a number that the medical officer should pay his substitute, and not the rate payers, as so often heretofore.

Mr. Flynn—We had to pay £37 to a substitute one time.

Chairman—The question now is—will the doctor have to pay his substitutes in all cases?

Colonel Gore—If he gets sick I would pay his substitute for him.

Father Nolan—If sick he will try to make out that the sickness was contracted while in discharge of his duty.

Mr. O'Hara—The payment should then come out of his private pocket, and not ont of the pockets of the rate payers.

Mr. Farrell—When a doctor gets leave he should pay his substitute.

Mr. Flynn—If he does not I would be for deducting it from his salary, as we have been too much mulcted already.

Chairman—Suppose your doctor contracts fever while attending a fever case, would you in that case oblige him to pay his substitute?

Mr. Flynn—He is employed to attend these cases.

Mr. James Massey—When sick the doctor will require something to support him, and more especially if he have a family. If you oblige him to pay a substitute, he will have to pay more than he himself receives, which would be too severe.

Mr. Kirkwood would be inclined to pay a doctor's substitute during illness but not otherwise.

Sir Charles Gore suggested that the board should reserve to themselves the power to pay the medical officer's substitute in special cases, as of sickness contracted while discharging his duty.

Mr. Flynn thought that would meet the case.

The Chairman then drew up the following resolution, which was unanimously adopted :—

"Resolved—That on any future occasion of the doctor requiring a substitute from any cause to perform his duties, the expense of such substitute shall be borne by him, unless the committee consider that under the circumstances of the case the district should pay the cost of same or any portion thereof."

KILLALA GUARDIANS.

ELECTION OF MEDICAL OFFICER.

There were three applicants—Dr. J. Atkinson, and Dr. McNulty—the same persons who presented themselves for election to the dispensary committee, which met previously.

A vote was then taken with the following result :—

For Dr. McNulty, 10 ; for Dr. Atkinson, 7.

Father Nolan said he was not sure if Dr. McNulty would accept the appointment ; but if he did not it would still be the duty of the Board to appoint a medical officer for the workhouse other than the dispensary medical officer, as it was all important to have two doctors, that the sick poor might not be neglected in the event of the absence or incapacity of one of them.

LIMERICK SANITARY BOARD.

A letter was read from the Local Government Board acknowledging the receipt of a letter of the 16th ult., forwarding a copy of the minutes of proceedings of the Public Health Committee, at their meeting on the 14th ult., containing an entry of the report of Dr. Barry, consulting sanitary officer, for the quarter ended the 30th of June, and with reference to Dr. Barry's remarks on the importance of the sanitary sub-officer receiving information respecting the places where dangerous infectious disease occurs ; the Board desire to suggest to the Committee the propriety of directing the sanitary sub-officer to wait on the sanitary officer at the dispensaries every week and make inquiries on the subject.

The sanitary sub-officer was directed to carry out the suggestion of Dr. Barry.

ATHY UNION.

The Clerk read the following :—

"The following is my report of milk submitted to me by the Master :—1st. That it contained only 8 per cent. of cream. 2nd. That it contains 25 per cent. and more of water. 3rd. That it was intensely acid after 16 hours. 4th. That it was unfit for use, and more, it was calculated to produce diarrhœa, thrush, colic, and many other diseases in delicate children and patients labouring under typhoid fever.

P. L. O'Neill."

Mr. O'Brien.—That is very bad indeed. Do you consider it was adulterated to the extent of twenty-five per cent. of water?

Dr. O'Neill.—It is not easy to ascertain to a certainty the quantity of water milk may be adulterated with. Good milk, in its normal state, contains between eighty and ninety per cent. of water, and that is increased or diminished according to the food cows are fed on. In this case the water contained twenty-five per cent. more water than good milk ought to contain, but it is not easy to say whether it was the produce of the pump, or attributable to the feeding of the cows. Except we can discover some mineral salt that we know is peculiar to some waters, we cannot say for a certainty that milk is actually adulterated, and if distilled water, which is very easily procured, be used, it would be nearly impossible to detect it in milk, except, of course, it were used in very large quantities.

Mr. O'Brien.—Do not tell them that, doctor.

Dr. O'Neill.—Oh, they know it quite well.

Mr. J. Brennan.—How long was the milk in the house, doctor?

Dr. O'Neill.—Twelve or thirteen hours.

Mr. O'Brien.—In that case you could not point to the contractor for anything you found wrong, for of course he could easily tell you it was tampered with in the house. It is the business of the master, if he has reason to suspect the milk, to take a sample of it in the presence of the contractor, giving him a third, retaining a third, and send the remainder to be subjected to an analysis.

It was agreed that no action should be taken at present, but that the new master receive instructions in accordance with Mr. O'Brien's suggestion.

TRALEE GUARDIANS.

The following letter was read from the Local Government Board :—

"Local Government Board, Dublin,
14th August, 1877.

"Sir,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 9th instant, inquiring if Doctors Hannafin and Kane, Medical Officers of Castlemaine and Kilgobbin Dispensary Districts of the Tralee Union, are entitled to an increase in their salaries as sanitary officers, their salaries as medical officers having been raised ; and, in reply, the Local Government Board have to state that the additional salaries of the officers under the Public Health Act are not subject to fluctuation according to an increase or decrease in their salaries as union officers, unless the Board of Guardians should determine to alter them subject to the terms of the scale approved of by the Treasury.—By order of the Board,

"B. Banks, Secretary.

"To the Clerk, Tralee Union."

Readers! take note. The Local Government Board for Ireland long since adopted the dispensary salary as the standard by which to gauge the sanitary salary, although the duties of one office have no relation whatever to those of the other. It has now decided that one salary shall *not* be regulated by the other, and it leaves the Guardians to make one ruling coincide with the other as best they can.

"THE UNION AMALGAMATION COMMISSION."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—Will you be good enough to inform your readers whether you think it probable that the commission, for which a government warrant has been issued to amalgamate the Irish unions and workhouses, so as in some measure to relieve the, at present, over-burdened rate-payers, will embrace in their useful inquiries the abuse of the Poor-law medical

relief system, which, if confined by some legal method to only the *fit objects*, would tend very materially to the same effect.

Faithfully, yours,
G. S. B.

September 3rd, 1877.

[So far as our information goes, the Commission will deal only with workhouse amalgamation, and only with the medical service so far as it is affected by such proposal. It will probably not touch the dispensary officers at all. The Irish Medical Association, is however, on the alert, and has communicated with the Commissioners, and should the interests of either workhouse or dispensary officers be involved, they will be looked after.—Ed M. P. & C.]

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF AUGUST, 1877.

August 1st.—Patterson, John, 4 Charlemont Terrace, Kingstown, co. Dublin, M.B. Univ. Dub. 1877, Lic. R. Coll. Surg. Irel. 1877.

2nd.—Sherrard, Henry Robert, Fermoy, co. Cork, Lic. K. Q. Coll. Phys. Irel. 1877, Lic. R. Coll. Surg. Irel. 1877.

2nd.—Bull, George Henry, South Charitable Infirmary and County Hospital, Cork, M.D. 1877 and M.Ch. 1877 Q. Univ. Irel.

3rd.—MacDermott, Ralph Jean, Kelly, co. Meath, M.B. 1877 and M.Ch. 1877 Univ. Dub.

3rd.—Delmege, Louis Edward, 36 Fithwilliam Square West, Dublin, Lic. R. Coll. Surg. Irel. 1876.

3rd.—Charleton, Henry Arthur Herbert, Clonmacnoise Shannon Bridge, King's County, Lic. 1877 and Lic. Mid., 1877 K. Q. Coll. Phys. Irel., Lic. R. Coll. Surg. Irel. 1877.

4th.—Evans, Wm. Godfrey, Gortroe, Castletown-Conyers, co. Limerick, Lic. R. Coll. Surg. Irel. 1877.

6th.—Maguire, Stanislaus, 77 Lower Gardiner Street, Dublin, Lic. R. Coll. Surg. Irel. 1877, Lic. 1877 and Lic. Mid. 1877 K. Q. Coll. Phys. Irel.

6th.—Turner, Reuben, 2 North King Street, Stockton-on-Tees, Durham, Lic. R. Coll. Surg. Irel. 1877.

7th.—Booker, Wm. Arthur, Clonleason, Kells, co. Meath, M.B. 1877 and M.Ch. 1877 Univ. Dub.

11th.—Walshe, John Lemon, Tinhalla House, Carrick-on-Suir, co. Waterford, Lic. R. Coll. Surg. Irel. 1877, Lic. R. Coll. Phys. Edin. 1877.

13th.—Dodd, Henry Francis, Killorglin, Killarney, co. Kerry, Lic. R. Coll. Surg. Irel. 1876.

14th.—Flannery, Jas. Gordon, 2 Regent St., Rochdale, Lancashire, Lic. R. Coll. Surg. Irel. 1876.

18th.—Fisher, Robert James, 22 York Street, Dublin, Lic. Apoth. Hall, Dub. 1877.

21st.—Riordan, Patrick Aloysius, Cloyne, co. Cork, Lic. R. Coll. Phys. Edin. 1877, Lic. R. Coll. Surg. Edin. 1877.

24th,—Atkins, Thomas Edward, 7 Patrick Street, Cork, Lic. Apoth. Hall Dub. 1877.

25th.—Walker, Henry Bourne, 4 Belgrave Terrace, Buxton Road, Stratford, London, E., Lic. R. Coll. Phys. Edin. 1877, Lic. R. Coll. Surg. Edin. 1877.

21st.—Bagnell, Wm. Henry, 59 Kenilworth Square, Rathgar, co. Dublin, Lic. R. Coll. Surg. Irel, 1877.

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING SEPT. 1, 1877.

The Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 19, 1877.

STUDENTS' NUMBER.

PART I.—The Future of the Student in Private Practice, or the Public Services.

PART II.—The Education and Qualification of the Student in the United Kingdom.

PREFATORY.

SINCE our last Students' Number a decided step towards medico-educational reform has been taken by the perfecting of the conjoint examination scheme for England, which will probably come into operation during the coming session. When it becomes law, the student will enter the profession in England by one portal, and will be obliged to satisfy as to his competency a Board of Examiners, to which all the Universities and licensing corporations in England will contribute members, and will have the credit of holding the qualifications for practice now issued by each of these bodies separately. This is a great bound toward a remedy of the long-endured abuses of the medical licensing system; and although it may not be followed immediately by a similar co-operation between Universities and Colleges in Ireland, it cannot fail to give immense moral force to the efforts of those who desire to raise medicine to a high scientific position, and to exclude from its ranks the socially inferior and professionally incompetent classes who so readily obtain entrance under the existing system. In Ireland several efforts have been made to arrive at a co-operative licensing scheme such as that now adopted in England, but the influence of lecturers, who fear a reduction in the number of lectures and lecture fees required from the student, has hitherto defeated all attempts. In Scotland examinational reform is scouted by the corporations *una voce*, and it may be safely assumed that the upas tree of North British diploma vending will not yield to any less drastic cure than the axe itself.

Public opinion and professional competition have, however, gone far to effect that improvement in medical education which colleges have rather followed than encouraged. What we said of the year 1876 we are gratified to be able to repeat of the current session. The sciences cognate to medicine are receiving a degree of attention which they have long deserved, but never previously received. This is particularly noticeable with respect to the more practical method now adopted of teaching these sciences, and especially those which, like physiology and histology, were formerly taught in such a manner that a theoretical knowledge of them was all that a student could take away from the schools. Nor can we fail to notice a like improvement in the medical and surgical education of the student, or fail to mark the difference between the qualifications with which the medical practitioner was formerly satisfied, and those which he is now anxious to take. The medical man who twenty years ago thought himself fully qualified with one diploma, now takes two, with perhaps a good degree into the bargain; and he who formerly only knew how to use the stethoscope and was satisfied with a very superficial knowledge of medicine and surgery, is now considered behind time if he is not *au fait* in the study of temperature, pulse tracings, antiseptic surgery, aspiration, germ physiology, bloodless surgery, State medicine, and many other new lights of our profession.

We have, as is our wont, given in our present issue merely the pith of the official regulations of colleges and public services, reserving our space for practical advice and information which every student needs, and leaving our readers to obtain for themselves the official regulations in a more reliable form than we can offer it. We conceive it to be our *rôle* to place in the hands of the student and his guardians the semi-confidential details, directions, and hints which college regulations are not intended to communicate, and which are only known to those conversant with the various systems of education, examination, and qualification, and with the ultimate prospects of the student.

PART I.

THE MILITARY AND NAVAL SERVICES.

ARMY.

THE past year has seen a great revulsion in the Army Medical Department. The department has been "unified," that is to say, the medical officers who have been hitherto attached to a particular regiment for perhaps their whole service life, are now connected with their own special department, and are liable to be shifted from one regiment to another as the requirements of the Service demand. They are no longer called Assistant-Surgeons, but are named Surgeon; while their superiors, sometime Surgeons and Inspectors, are now Surgeon-Majors and Surgeon-Generals. The Service is, moreover, no longer a permanent provision, for after ten years' service a Surgeon is liable to get his *congè*, being handed £1,000 "in lieu of all pension and retirement." This bonus of £1,000 depends wholly on his completing his ten years' service. Should he fall sick before that time he will find himself very differently dealt with. He will be given six months on half-pay to get well, and if he is not up to time, six months longer *without* pay; and, if still ill, will be then dismissed without pension or bonus if he has not achieved his five years, with a reduced bonus if he have. It may be believed that these arrangements so far from allaying the discontent of Army Medical Officers have aggravated it, and all the objections previously urged against the Service apply with increased force now. The Director-General has, consequently, had the greatest difficulty in finding a sufficient number of candidates for the Service to keep the Army Medical Department alive. It is likely that Parliament will sweep away the whole arrangement in the coming Session.

CONDITIONS.

The official regulations may be obtained on application to the Director-General, Army Medical Department, 6 Whitehall Yard, London, S.W.

Examinations are held in February and August, but have ceased to be competitive owing to the dearth of candidates.

The candidate must be under thirty-two years of age, but may be married.

The candidate must make a declaration that he labours under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a medical officer in any climate. His physical fitness will be determined by a board of medical officers, who are required to certify that the candidate's vision is sufficiently good to enable him to perform any surgical operation without the aid of glasses. A moderate degree of myopia would not be considered a disqualification, provided it did not necessitate the use of glasses during the performance of operations, and that no organic disease of the eyes existed.

Having received his diploma in surgery and medicine, both of which are essential to his competition, the student is obliged to apply himself vigorously to the study of certain collateral subjects, which he does usually through the medium of a "grinder." He must perfect himself in chemistry, pathology, and comparative anatomy, and if he can throw a proficiency in botany and natural history, and French and German into the scale, he will materially improve his position in the scale of merit, and establish for himself a character with the authorities for industry and scientific attainments.

The surgeon is subjected to two examinations; one on admission into the service, and a second six months later on leaving Netley.

For the first candidates will be examined in the following, and the highest marks attainable will be distributed as follows:—1. Anatomy and Physiology, 1,000 marks; 2. Surgery, 1,000; 3. Medicine, including Therapeutics, the Diseases of Women and Children, 1,000; 4. Chemistry and Pharmacy, 100. Examinations will also be held in French and German (150 each) 300 marks; Natural Sciences, 300. The Natural Sciences will include Comparative Anatomy, Zoology, Natural Philosophy, Physical Geography, and Botany, with special reference to Materia Medica. The number of marks gained in both the voluntary subjects will be added to the total number of marks obtained by those *who shall have been found qualified for admission*, and whose position on the list of successful competitors will thus be improved in proportion to their knowledge of modern languages and natural sciences.

For the first two days of his examination he is employed in penning answers to printed questions; for the third and fourth days he is examined *viva voce* on all subjects; and on the fifth and sixth days he is tested by the diagnosis of disease at the bedside in the hospital, by the application of surgical apparatus, and by operations on the dead subject. This trial finished, the successful candidates are selected.

SERVICE ON THE WEST COAST OF AFRICA.

A certain number of candidates, whose answering has been satisfactory, but not sufficiently so to entitle them to a place, were formerly offered appointments on the West Coast of Africa, but recently they have been appointed to the Naval Medical Service, as vacancies on the Coast have not existed for some time. These situations, while they are subject to strong objection on the score of the deleterious nature of the climate, possess some advantages for those whose health can resist its influence. The districts comprised under the West Coast Districts are Sierra Leone, Gambia, and Cape Coast Castle. If the candidate accepts the appointment he is sent out at once, without the period of probation to which others are subjected at Netley Hospital. He is allowed to spend a year at home on full pay, for every year spent in Africa, and the entire period at home and abroad should count as service for pension.

PROBATION AT NETLEY HOSPITAL.

The competitor who has been so fortunate as to obtain a place in the ordinary Service is not allowed to join a regiment at once. He is obliged to undergo a probation of four months at Netley Hospital, near Southampton, where he is compelled to attend the following lectures: Hygiene, vacant; Pathology, by Dr. Aitken; Military Surgery, by Dr. Longmore; and Clinical and Military Medicine, by Dr. Maclean; Dr. de Chaumont, Anatomy Hygiene; and Dr. Macdonald, on Naval Hygine. The lecturers on Military Surgery include gun-shot and other wounds; arrangements for the transport of wounded; duties of army surgeons in the field, during sieges, on transport, &c., and other special subjects. Those on Military Medicine refer to the tropical and other diseases of the British possessions and colonies, and to the losses by disease. The lectures on Hygiene relate to the examination of water, air, food, clothing, &c. of the soldier, his duties and exercise, and the circumstances affecting his health, meteorology, statistics, and prevention of disease. The lectures on Pathology have reference chiefly to the scientific examination of tropical diseases, and of the other complaints which the army surgeon is especially called on to investigate. The candidates also attend the wards of the hospital under the Professor of Medicine and Surgery, to make themselves acquainted with the system of recruiting, and the modes of keeping the Army Medical Returns. They are also called on to make post-mortem examinations, to operate on the dead body, and to pass through laboratory practice on the modes of recognising the qualities and adulterations of food, and on microscopic examination of morbid tissues, and adulterations of food, &c. During his preliminary training here the student is understood to be in Her Majesty's Service; he wears uniform, is under military discipline, and receives pay at the rate of five shillings per day, and two shillings per day for lodging money, if he be not provided with lodgings in the hospital. A sum of money equal to the half-yearly interest on £1,200, the surplus from the "Herbert Memorial," is at the end of each session awarded to the candidate who has the highest number of marks, the fortunate young man who wins this "Blue Ribbon of Netley" being tolerably certain to be well provided for. At the termination of the four months he is again examined in the subjects in which he has been instructed during that period, his marks are added to those obtained by him at the competitive examination, and his position on the list of merit determined by the total. Successful candidates are now eligible to be gazetted to a regiment, or employed on the staff, and enjoy all the rank and honour, pay and privileges, of surgeons, as provided by the regulations.

Thus it will be observed that the first examination simply admits the candidate to the Service, and the conjoint result of it and the Netley examination determines his order of merit.

LIFE AT NETLEY.

The medical candidates, as the surgeons are called until they have passed out of the hospital by their second examination, are congregated at Netley, in addition to the commissioned officers who may be there. During the period of his residence at the Army Medical School each candidate will receive an allowance of 5s. per diem, with quarters, or 7s. per diem without quarters, to cover all cost of maintenance; and he will be required to provide himself with uniform (viz., the regulation undress uniform of a surgeon, but without the sword). Each candidate has to pay £5 towards the mess fund, one half on his arrival and the remainder when he has passed his second examination. He is then a member of the mess, and entitled to dine at any time during the remainder of his service. The cost of dinner is 2s. 4d. daily, not including wine, and of breakfast from 10d. upwards.

INDIAN MEDICAL SERVICE.

THE regulations, subjects, and times for examination are the same as for the Army Medical Department. Passage allowance to India on appointment will be given, or a passage provided. When passages are provided on board the Indian troop ships, a charge for messing will be made at the rate laid down in the Royal Passage Warrant of 1865. Pay at 10s. a day will be allowed from date of passing final examination at Army Medical School.

Indian allowances and time of service for pension will reckon from the date of arrival in India.

Surgical instruments are provided in India by the Government for the use of medical officers.

The pay of medical officers in the Indian service is much better than at home, and, if unmarried, the cost of living not greater. Moreover, the medical officer frequently holds lucrative civil medical appointments which afford him a handsome increase of income. Without doubt, to a healthy, temperate, unmarried man the Indian Service is greatly preferable to that at home, but to a delicate person, or one burthened with a wife and children, the advantages are questionable.

For official regulations of the Indian Medical Service apply to the Indian Office, Whitehall, London, S.W.

NAVAL MEDICAL SERVICE.

In applying to be admitted as a Surgeon in the Royal Navy it is merely required to address a letter to the Secretary to the Admiralty, stating that you are in possession of a diploma from such a College—naming it; that you are desirous of being admitted as a candidate; when, if there are any vacancies, you will be informed when you will be required to present yourself at Somerset House, London, for examination.

The subjects and method of examination and the subsequent service at Netley are in all respects similar to those referred to above under the head of Army Medical Department.

Having passed your examination and served your Netley, probation you will, in the course of the following day, receive your appointment as acting Surgeon to one of Her Majesty's ships, either for service on board that ship, or for service on shore, at one of the naval hospitals—Haslar or Plymouth. You will at the same time be informed that you are granted two or three weeks', as you may require, leave of absence, to enable you to provide your uniform and appointments. These you can get at any of the naval outfitters.

The expense of a Surgeon's uniform is about £47 5s. You must also provide yourself with a set of surgical instruments, which will cost you from ten to fifteen guineas. All kinds of underclothing, towels, handkerchiefs, &c., may be purchased much more advantageously from a regular dealer in those things than from any naval outfitter.

PRIZE MONEY.

Medical officers share in the proceeds of all prizes captured from the enemy, of captures and seizures under the several Acts of Parliament passed relating to the revenues of Customs, and of trade and navigation, for the abolition of the slave trade, for the capture and destruction of pirates and piratical vessels, and of the rewards conferred for the same, as also in the awards of all salvage granted to the crews of her Majesty's ships and vessels of war with other officers of corresponding rank.

The full and half-pay of Naval Medical Officers is in accordance with the following scale:—

Full-pay: Surgeon—Under five years' service, 11s.; eight years', 12s. 6d.; under eleven years' service, 14s.; under fourteen years' service, provided he passed his examination as Staff Surgeon, 15s. 6d.; above fourteen years', 17s. Staff Surgeon—On promotion, 18s.; seventeen years', £1; and for each additional year of service, 1s. a day more until the maximum is reached—namely, £1 2s. Fleet Surgeon—On promotion, £1 3s., and up to £1 10s. Half-pay Surgeon—Five years', 6s.; eight years', 8s.; eleven years', 10s.; above eleven years' service, provided he passed his examination for Staff Surgeon, 17s. Staff Surgeon—On promotion, 11s.; seventeen years', 13s.; above seventeen years', 14s. Fleet Surgeon—On promotion, 16s.; twenty years' service, 16s. 16d.; and for each additional year of service, 6d. a day more until the maximum is reached—namely, 18s. 6d.

Retirement is provided for according to age and service, under special regulations.

By warrant of February, 1875, it has been enacted—

1. Surgeons on entry have the same relative rank as Paymasters, Chief Engineers, and Naval Instructors—namely, to rank with Lieutenants under eight years' seniority.

2. Staff Surgeons to be denominated "Fleet Surgeons," and Staff Surgeons second-class simply "Staff Surgeons;" the distinction in rank between these two grades to be denoted by a small difference in the uniform.

3. Inspectors-General to be compulsorily retired at the age of sixty; to be allowed £2 per day, provided they shall have completed the service to entitle them to the maximum half-pay of their rank.

4. Fleet Surgeons and Staff Surgeons same scale of retirement as chaplains and naval instructors, secretaries and paymasters.

5. Fleet Surgeons to have the option of retiring after twenty years' full-pay service in all rank at 15s. per day, and after 25 years, 21s.

THE CIVIL PUBLIC SERVICES.

POOR-LAW MEDICAL SERVICE.

A young qualified practitioner indisposed to be an assistant, and desirous of commencing general practice without investing any money in purchasing a succession, may, perhaps, obtain a Poor-law appointment, though he should scarcely expect to obtain a livelihood from the inadequately remunerated appointment.

ENGLISH POOR-LAW MEDICAL SERVICE.

Prior to the passing of the Medical Poor Act of 1867 the English Poor Law Medical Service may be said to have been in the hands of the guardians, supervised by the Local Government Board. Each Parish in England and Wales has its Guardians of the poor, and these parishes were grouped together to form unions. The unions were divided into districts for medical relief. Union medical officers, therefore, have the care of a district, or sometimes the care of the workhouse of the union—sometimes of both. The officer was elected by the guardians, and the appointment approved by the Local Government Board. He was required to have both a medical and surgical qualification. In some instances these were specified, but almost always the *London College of Surgeons* and Apothecaries Hall *were the most favoured* diplomas. But this is not the case now. So long as candidates possess a durable qualification, such as that of the L.R.C.P. Lond. they are quite eligible for these appointments, and have a good chance of obtaining them if their testimonials are good, and they have a few friends on the Board.

The salaries of Poor-law appointments are very low; in fact, so preposterously inadequate that it would seem as if the medical man were paying the union for the monopoly of doctoring its paupers. *£25 a year is a not uncommon salary* for attending and providing physic for a large district, and thus as the medical officer has to provide all the medicines, the poor have often to put up with a very scanty supply. It must, however, be admitted that lately the Local Government Board have done much to mitigate this evil by providing, as far as large towns are concerned, local dispensaries from which the pauper patients are supplied with medicines. By this means not only is the work of the medical officer much lightened, but as he has not to pay for the drugs, his salary is virtually increased. Although this plan is only adopted in London and some of the larger towns, it is to be hoped that it will be extended as far as possible to the more populous rural districts. Where dispensaries cannot be established a fixed sum might be allowed for drugs, for if the medical officer chooses to work for nothing, or next to nothing, it is a great hardship both upon him and his poor patients to make a contract that he should have to provide everything out of his small salary. Let all the drugs be found for him; for to this it must come at last.

Usually all capital operations, reduction of dislocations, midwifery, vaccination, &c., are paid for at a separate tariff. But vaccination which used to be a considerable addition to the salary of the parish doctor, is often given in urban districts to medical men who are in no way connected with parish work.

The above system differs in many respects from that of Ireland, referred to below. In English districts, moreover, the practitioner derives much of his income from "clubs," and from attendance on small tradesmen, artisans, and tenant-farmers, who would certainly be recipients of gratuitous relief in Ireland; and therefore the parish work of the English provincial doctor is proportionately much lighter than that of his Irish *confrère*. The sanitary duties of the profession in England are also remunerated at a much higher rate, though by no means more onerous than similar duties in Ireland. Parish appointments are, however, sought after by young men as a means of getting into practice, and are often almost obligatory in the country to prevent fresh opposition being introduced. The Metropolitan Poor-law Act, 1867, assimilates the Poor-law, so far as London is concerned, to that of Ireland, and the Poor-law Board is now merged in the new Local Government Board. It has established in London asylums and dispensaries, and distributed the cost of supporting them over the metropolis. Under the new Public Health Act many Poor-law officers have been also appointed medical officers of health.

THE IRISH POOR-LAW SERVICE.

The newly-qualified medical practitioner who may elect to try his luck in the Irish provinces sets his hopes, in the great majority of instances, upon obtaining one or more Poor-law medical appointments in some district where there is hope of private practice. There are 163 workhouses and about 793 dispensary medical officers, besides apothecaries. The number of vacancies that occur annually averages 100. The average salary in this service is now about £103 15s.; and when it is taken into consideration that in the vast majority of rural districts it is necessary to keep a horse, and in some a boat as well, the average area being from forty to sixty square miles, it is plain that there will not be a very large margin left from the public emoluments. The medical officer is also *ipso facto* the registrar of births, marriages, and deaths, and the medical officer of health for the district, under the Public Health Act passed in 1873. The former office, in country districts, seldom yields more than £10 a year, and often not half that amount, and the emoluments of the latter appointment in very few cases reach £20, averaging about £12. The medical officer is also vaccinator for the locality, and is required to vaccinate every one who wishes to come. For each patient his fee of 1s. is paid, along with his salary, by the guardians, and the sum total of these fees varies, according to the populousness of the district, from £2 to £50, an average for the provinces being about £5. Despite the miserable salary, and the very many discomforts of dispensary life, these appointments are generally eagerly sought for—firstly, because they afford the new comer a certain, though hardly-earned salary, to supplement his private earnings; and, secondly, because, if not secured by the new comer, they would of necessity bring a competitor for practice into the field, and inasmuch as private income is of far greater import than public earnings, country medical practitioners are obliged to undertake the public duty in order to save themselves the monopoly of their private emoluments.

APPOINTMENT.

The qualifications required by the Poor-law Commissioners are a Licence in Surgery or a Diploma in Medicine, and a Diploma in Midwifery; the candidate must also be 23 years of age.

The appointment lies with the Dispensary Committee, who elect by vote. As politics and religious feeling run high in Ireland, these elements enter into the election of Poor-law medical officers. Family interest also possesses great weight.

The candidate will do well to bear these facts in mind, as his personal attendance on the day of election will be required, and whatever other qualification he may have, he will then find that his compatibility in these respects with the majority of the committee is essential; and, accordingly, he had better first make himself acquainted with the local peculiarity, whatever it may be, before he enters on his candidature, otherwise, in all probability, any expenditure that he may make in the matter will be simply thrown away. We may here observe, also, that in very many instances the appointment is virtually made before the advertisement appears for a medical officer, in which case, also, candidates are put to unnecessary trouble and expense under false pretences.

CONTROL.

Each district is under the direct control of a committee composed of the neighbouring landholders, the appointment of medical and other officers is made by this committee, and the entire management of the district is under their control. Their acts are, however, subject to the approval of the Local Government Board, who have the power either of interposing their veto on any appointment, or even of expelling an officer by a "sealed order," without trial or accusation, or without the resource of appeal or investigation. The salary is paid by the Board of Guardians, and no increase can be made in the amount without their assent and that of the Local Government Board. Under the late Sanitary Act the committee may recompense the medical officer for special services, such as those during an epidemic of cholera, or for sanitary reports. The number of unions in Ireland is 163, to each of which is attached a medical officer, who is appointed and controlled by the Board of Guardians in the same manner as the dispensary surgeon is by his committee. The salary is usually better than that of the dispensary doctor, and the duties of a more easy and satisfactory description, inasmuch as the duties are confined to daily attendance at the workhouse hospital, and no night visits out of doors or any long journeys across the country are involved.

DUTIES.

The duty of the dispensary doctor is twofold. He is to attend his dispensary on a given day or days in the week. Frequently there are two dispensaries in the district, separated from each other by several miles, and he will have perhaps to attend two days a week. He has also to visit at any hour of the day or night a sick person for whose relief a visiting-ticket has been issued by a member of the committee or by the relieving officer, and to continue his attendance as often as may be necessary until a termination of the case. Moreover, he has a great many registry books to keep and a multitude of returns to make, and in the majority of districts he has to make up all the medicines for the poor.

The pressure of these duties is in the greatest degree dependent on the goodwill of the members of his committee. If the medical man be a favourite with his masters, they will give him very little trouble with "scarlet runners," as the visiting-tickets are, from the colour of the paper on which they are printed, humorously called, and will be unwilling to trouble him even with cases deserving of personal attendance.

If, on the other hand, it is his misfortune to come in contact with some of the half-bred committee-men, who know nothing of the treatment fit for an educated gentleman, or cherish a personal spite, the discharge of his duties may become simply unbearable. He may be peremptorily summoned, in any weather, at any hour, and to any distance, to a case which he may probably find to be altogether trivial, or to a person whom he may know to be perfectly well able to pay—aye, even the committee-man's own brother or daughter.

SUPERANNUATION.

By a recent Act of Parliament a Poor-law medical

officer may now receive a pension not exceeding two-thirds of his salary on being incapacitated from illness or old age. This grant is strictly at the discretion of the guardians; nevertheless, it has been given in most cases in which physical incapacity has been clearly proved. It is, however, at best a miserable resource, and can by no means be calculated upon as a provision for old age. There are now 53 ex-medical officers receiving superannuation allowance, whose average term of service before pension was 20 years, and whose average allowance is £64 15s. Their average age at retirement was 63. All official information may be obtained of B. Banks, Esq., Local Government Board, Custom House, Dublin.

Complete information as to fees, emoluments, duties, and appointment of Irish Poor-law medical officers will be found in the "Irish Medical Directory" for 1877.

ASSISTANCIES, SHIP SERVICE.

ASSISTANTSHIPS IN ENGLAND.

As soon as a gentleman has secured his diplomas he begins to look round him and consider (often for the first time) what he is to do next. The public services such as the Army, Navy, and Civil Service, are all open to competition; they are not, however, very popular, because the remuneration is not such as would enable anyone to save money, and the pension is far off and inadequate to retire upon.

The courses remaining open, therefore, are to secure a practice in Great Britain or to become an assistant, at home or abroad. The purchase of a practice involves the outlay of capital, for no one can be expected to give away (especially to a stranger) that which he can sell. This and other points are fully and fairly discussed in a little shilling pamphlet, entitled *Advice on Transfer of Medical Practices and Partnerships*, by J. Baxter Langley, M.R.C.S. A perusal of this would seem a great waste of time and money to those who seek to settle in practice by purchase or otherwise.

We therefore turn to "Assistantships at home or abroad" as the alternative presented to the possessor of a new diploma. There are scarcely any such appointments in London except in the artisan quarters. The higher class of Practitioners in the West End or high-class districts write prescriptions, visit their own patients (who would accept no substitute); and such medical men could not find any work for assistants and do not as a rule employ any. An appointment as assistant, therefore, need not be sought in London (except at the East End or like localities).

In the country an assistant is necessary to every man in large practice. The conditions and legal responsibilities of such situations are fully set forth in a small work entitled "Via Medica" by the author previously quoted. No young gentleman should enter upon an assistantship without reading this little book. We especially commend its study to gentlemen educated in Ireland and Scotland, who come to England and seek for appointments for which they are wholly unprepared by previous experience.

Assistantships in England are either *out-door* or *in-door*. The "out-door assistant" lives in lodgings or sometimes in a house provided by the principal. As a general rule, he is expected to provide himself with board, residence, attendance, &c., and is paid a salary varying from £120 to £200 a year. The work falling to his share is that which the principal himself desires to avoid—viz., the dispensing, the club and parish work, and sometimes the book-keeping. Very few medical men in England keep a dispenser, and when they do so they rarely or never require any other assistant. The "indoor assistant" lives in the house, being provided with board and residence; his duties are the same. His comforts mainly depend upon the relations existing between himself and the family of the principal with whom he is constantly associated.

It should be distinctly understood that assistantships in England cannot be regarded as stepping stones to practice or partnerships, at least so far as the particular place where the assistant is engaged. His chances of success there are less than in any other place, and so long as any surgeon can get his work done by an assistant he is not likely to sacrifice a part of an assured income to a partner.

Locum-Tenens appointments may be classified with assistantships. Such appointments can only be prudently undertaken in England by doubly qualified and registered men *accustomed to English practice*, as they are left in sole charge during the incumbent's illness or other contingency. They are paid from £2 12s. 6d. to £5 5s. a week with board, residence, and second-class travelling expenses. Some gentlemen give their entire time to this kind of work which, however, requires peculiar adaptibility.

SURGEONCIES IN THE MERCANTILE MARINE.

THE appointment of surgeon in sea-going vessels is much sought after by young surgeons who are desirous of seeing a little more of the world than school, college or home have shown them; but the office is seldom held for more than a few years. These apoointments are almost uniformly in the gift of directors and secretaries of companies, and of the owners themselves, with whom, as may be believed, personal influences are a better recommendation than any professional qualification.

The Cunard and other American mail lines select their surgeons through the interest of owners and managers. The English ships are bound to carry English medical officers, and American ships American surgeons. The pay varies from ten guineas per month upwards, and the arrangement may be terminated by the surgeon at any time that the ship is laid up, unless he has signed special articles.

The West India Mail Service admits candidates only between the ages of twenty-two and forty. A regular curriculum similar to that required by the licensing bodies is necessary, and a special examination in climateric disease is sometimes administered to the candidate. At entry, surgeons are requested to join vessels in the West Indies or Brazils, relieving surgeons longest out, and being themselves relieved in turn.

BRITISH SETTLEMENTS.

THERE is a growing demand for surgeons for small European colonies, and several desirable appointments have been recently made. A number of colonists feeling the want of efficient medical advice subscribe an annual guarrantee salary of from £200 to £800, allowing the appointed candidate to make what fees he can by private practice in addition. In most instances a knowledge of the French or German languages is essential. At present some such vacancies exist in newly-settled districts north of the Cape of Good Hope. Candidates must be practical surgeons, and able to ride fifty or a hundred miles a day.

PART II.

THE FIRST STEP IN MEDICINE.

REGISTRATION.

To the General Medical Council is entrusted the supervision of Medical Education, and it has made a number of recommendations, the majority of which have been accepted by all the Examining Bodies, and are, consequently, found in their regulations. The student has, therefore, nothing to do with the Council, except that he must take care to be duly registered as a Student in Medicine, *at the commencement of his career*, at the offices, 315 Oxford Street, London, or at the office of the Branch Registrar of the division of the United Kingdom in which he is residing. He must in England previously have passed a preliminary *Arts Examination*. In order to effect this, each student should apply according to a form, accompanied by a certificate, of his having passed such examination, the same to be lodged with the Registrar, who will thereupon enter the name in the Students' Register, and issue a certificate to that effect.

The intention of this registration is to ensure that the student shall occupy four years in medical study, which is, theoretically, the period which must be devoted to his education before his entry to the profession. In England this requirement is set down as essential, and no student can present himself for examination sooner than four full years from the date of registration, but the obligation to occupy this period in medical study is frequently satisfied by a nominal service for the first year under a general practitioner, or in a provincial hospital or dispensary, and the actual period of medical study is often really three years. Recently, however, the several qua-

lifying bodies are recommended by the Medical Council not to admit to the final examination, for a qualification under the Medical Acts, any candidate whose name has not been registered at least 45 months previously. Besides, the standard of medical education, as well as of the examinations of the various examining bodies, is so much higher than it formerly was, while our knowledge of medicine and the collateral sciences, and the scope of our medical studies, have recently become so enlarged, that four years is by no means too long a period to be devoted to medical study. And even the diligent student will find that at the expiration of this term he will have but an imperfect acquaintance with several branches of his profession.

In Ireland and Scotland the majority of the licensing bodies do not insist on the passing of Arts Examination before registration, nor do they insist on four years' study from any fixed date—a system which is reprehensible on the part of the licensing bodies, highly objectionable in its effect upon medical education, and very injurious to the student. It offers a premium to idle or uneducated students to put off the paltry preliminary examination *de die in diem* until the eve of his medical examination, and it enables the student to receive his diploma within less than three years of study, because the date from which his commencement is calculated is not fixed. Generally speaking, in Ireland the student's name is forwarded to the Registrar of the Branch Council by the public officer of his school, and therefore he need give himself no trouble about it.

REGISTRATION OF PRACTITIONERS.

All duly-qualified Physicians, Surgeons, Medical Graduates, and Apothecaries are required by the Medical Act 21 and 22 Vic., c. 90, to be registered before they can hold any public medical or surgical appointment, or issue valid medical certificates.

The medical registration of any practitioner may be effected on personal application or in writing (according to a form to be had in London or at either of the Branch Offices). With such application he must produce or transmit the *Diplomas* to be registered, and also pay or remit the fee, which is regulated by the Medical Council —viz., £5 for first registration, and 5s. for every qualification which may be subsequently added. Each practitioner is entitled to receive a copy of the official Medical Register containing the registration free on application.

THE CAREER OF THE ENGLISH MEDICAL STUDENT.

Several courses are open to the young gentleman who has decided to enter the medical profession in England, whether he fulfil his curriculum in London or in the provinces. As the latter course is generally determined by local causes, we will first of all point out a few things that concern both London and provincial medical students.

APPRENTICESHIP.

The Society of Apothecaries, hitherto fettered by Act of Parliament, required an apprenticeship. The apprentice was, however, of late years allowed to fulfil part or all of his curriculum during his apprenticeship, and under the Act recently passed it is entirely dispensed with. This system, be it said, when carried out in a liberal manner, was not without its advantages. In the early part of his pupilage the apprentice not only learned practical pharmacy, and became acquainted with the more generally used articles of the materia medica, but was often assisted in preparing for the preliminary examinations. He often, indeed, gained a thorough acquaintance with, and had indelibly impressed upon his memory, the doses of the different drugs used in medicine, the composition of the more important compound preparations, those drugs which are compatible and those which are incompatible with each other, and many other facts in practical pharmacy, of which, under the present system, even otherwise good men often show a lamentable amount of ignorance. Moreover, he prepared himself to take, should he ever wish to do so, the post of assistant to a general practitioner, as the experience he had thus acquired would procure him a situation in preference to prizes, gold medals, and even university distinctions. Again, this experience was of the very highest value on settling in general practice, especially in country practice, where he would, in all probability, be bound to dispense his own medicines.

PUPILSHIP.

In place of the old plan of apprenticeship a young man can become the *pupil* of some one in practice. This is frequently done by those who aim at the higher branches of practice. An experienced practitioner, whether a physician or a surgeon, who will superintend or direct a pupil's studies, offers great advantages, and we think that those who can afford a pupilship, will not regret the expense of providing themselves with such a guide.

THE PRELIMINARY EXAMINATION.

We would remind the student that some preliminary examination in arts, which is recognised by the General Medical Council, *must* be passed by him *before* entering a hospital. The subjects must include Latin and mathematics. There are numerous preliminary examinations of which a list may be obtained. For the English Medical Student we should say that, *cæteris paribus*, the Matriculation Examination of the London University is the best. We do not deny that it is more severe than most of the other preliminary examinations, but, nevertheless, we would recommend those who have sufficient ability and the time to prepare for it to matriculate, as they will thereby be enabled hereafter, if they should desire so to do, to present themselves for examination for the degrees in Medicine or Surgery conferred by this University. It is also accepted by the College of Surgeons in lieu of the Arts Examination otherwise imposed on candidates for its Fellowship.

Should circumstances deter the student from offering himself for the matriculation, he will find an easier standard in one or other of the preliminary examinations for the Fellowship or Membership of the Royal College of Surgeons of England, or the Licence of the Society of Apothecaries. Full information with regard to the dates and subjects of examination, or the list of examinations recognised by these bodies, may be obtained from the Secretary to the College of Surgeons, Lincoln's Inn Fields, or from the Beadle at Apothecaries' Hall, Bridge Street, Blackfriars.

It is to be hoped, however, that the student has not gained a knowledge of classics merely with the view of passing the preliminary examination, or that these studies will not be entirely thrown aside and forgotten directly he has passed this examination. Independently of the mental discipline involved in the pursuit of these studies, the nomenclature adopted in the study of his professional subjects and the etymology of scientific terms, are so generally of Greek or Latin origin, that were it for this reason only, it would be quite worth while for the student to keep up, as far as possible, a knowledge of these languages. At the same time the modern languages must not be forgotten, as a good knowledge of either French or German, especially the latter, will be found of great service to those who wish to enter the higher ranks of the profession, more particularly with respect to any future contributions they may make to medical literature.

HOSPITAL STUDY.

A pupil may enter at any of the London hospitals without having passed through either a pupilship or an apprenticeship. Provided he has passed a preliminary examination, he has only to pay his fees and hear the Introductory Lecture on the 1st of October, when he is admitted at once to all the privileges of a medical student. He should decide on the diplomas he requires,

and guide his studies accordingly. Most schools have now a composition fee, entitling to all lectures and practice required for the ordinary qualifications in medicine and surgery. They also mostly have another sum, very little higher, entitling the student to *perpetual* attendance on all lectures and hospital practice. It is best to take the perpetual ticket, as all contingencies are thereby provided for. The fees are generally payable in instalments, at the commencement of each winter session. The Dean of any school will always forward details, as well as any special information which a student may need.

RESIDENCE.

The student who comes to London to fulfil his curriculum at a metropolitan school generally requires lodgings, unless he can live with relatives or friends, which is of course better. Comfortable furnished apartments are to be had in respectable streets near all the hospitals. Two brothers or two friends can, of course, do this a little less expensively than one. The price varies with the season and the quality of the rooms. It should be mentioned that one or two of the Medical Schools (St. Bartholomew's, University College, King's College), have collegiate institutions in connection with them, where rooms may be had, instead of taking lodgings. At many schools, also, some of the lecturers receive pupils. Special information on this subject may be had on application to the Dean or any of the lecturers.

PRIZES AND SCHOLARSHIPS.

As to contending for prizes, there are differences of opinion. Diligent attendance on the classes and in the wards will enable the student to store his mind with knowledge fitting him for his profession, and this should be his first aim. Gold and silver medals are honourable distinctions, but only secondary ones. Still, we would not discourage those intending to compete. It should be remembered by all students that the true end and aim of their studies should be to make them good physicians or surgeons. They should study diligently to make themselves such, and there can be no reasonable objection to their striving for, in addition, an extra good standard in any subject or subjects in which they feel they are qualified to obtain it. In so far as prizes and scholarships encourage the study of particular branches, there can be no objection to them. Nearly every student excels in some subjects more than others, and a prize is an additional incentive to arduous, but otherwise unrequited, studies. The only danger is that they should become too special, and encourage one branch of study at the expense of the others. Students have often failed at examinations where the number of subjects was numerous through giving undue attention to some favourite branch of study.

Competition for appointments to dresserships and other offices, where much practice is seen, stands on a different footing. No prizes can equal such posts, and the possibility of getting them should influence largely the choice of a school. In some schools they must be paid for. In others the diligent gain them without extra expense. The student having selected his hospital and school, has chosen his teachers. We have only to remind him that, however able they may be, the result depends chiefly on his own application.

CURRICULA AND QUALIFICATIONS.

As to these, the information most valuable to students may be divided into two parts :—

I. The regulations with which they must comply before they can present themselves for examination to any of the licensing bodies.

II. The means that exist to enable them to do so. In the first division are to be placed the regulations of the corporations ; in the second, some account of the many schools of medicine and hospitals where professional education can be pursued. A natural supplement to this information is a brief sketch of the career open to young men after they have obtained their diplomas, especially in the public services.

In accordance with this plan, we proceed to consider—first, the Regulations of the Qualifying Bodies. These may also be divided into two classes—I. The Universities ; II. The Corporations.

THE UNIVERSITIES.

OXFORD AND CAMBRIDGE.

Every student in medicine must pass all the examinations for the degree of B.A., and date the commencement of his medical studies from the final examination for arts. Candidates for the degree of B.M. are required to pass two examinations, embracing the usual subjects. At the second examination he is examined in two of the ancient authors—Hippocrates, Aretæus, Galen, and Celsus—and in some modern authors, as Morgagni, Sydenham, or Boerhaave. He must spend two years in study prior to the first or scientific examination, and two years more after passing the first, prior to the final examination for the same degree. A dissertation has to be publicly read three years after obtaining the M.B., before being eligible for the M.D.

At the University of Cambridge, five years of medical study are required, unless the student has graduated with honours as B.A. For the M.B., he must have resided nine terms in the university, and have graduated in arts. There are three examinations for this degree. The first is in chemistry, physics, and botany ; the second, in anatomy (human and comparative), physiology, and pharmacy ; and the third, in the usual practical subjects. After the third examination an Act has to be kept, which consists in reading an original thesis, followed by an oral examination on the subject of the thesis. The M.D. degree may be taken three years after the M.B. An Act has to be kept, with oral examinations, and an essay has to be written *extempore*. There is also a degree of Master in Surgery, for which the candidate has to attend extra courses of lectures on anatomy and surgery. An examination in so much of State Medicine as is required by medical officers of health, will be held in October, 1877. With respect to Cambridge (and almost the same remarks apply to Oxford), a residence during nine terms—*i.e.*, the greater part of each of three years—is by statute requisite to obtain any degree in arts, medicine, or any other subject. The actual cost of this to a student who keeps his terms by residence in a college is from £150 to £200 a year. This, however, would include all payments to the university and the college—all fees, as well as clothes, pocket-money, travelling expenses, &c. But the non-collegiate students have only to pay the university fees, which are very small. They lodge and board as they like, and their expenses, therefore, are entirely in their own hands.

THE LONDON UNIVERSITY.

For those who would not like or cannot afford to enter a college, it is, perhaps, preferable to graduate at the University of London. The medical degrees of this university have now obtained a reputation second to none. No student can therefore propose to himself a higher qualification. The training is rather longer than is required for the diplomas of most corporations. The examinations are very stringent, but in after years the student will feel the gratification of having obtained such a degree. Every student is required to go through the full course of hospital duties *after* he has passed the matriculation examination. It is, therefore, very important that he should matriculate before entering a medical school, otherwise he will be compelled to stay more than four years at an hospital, as the university regulations require four years of hospital study and attendance on lectures *after matriculation*. The matriculation examination of this university is accepted as a preliminary by the Medical Council, and therefore the labour bestowed in preparation will serve the student's purpose, even if he do not proceed to a degree.

We should also strongly recommend those students who

intend to graduate at the London University to so arrange their studies as to pass the preliminary scientific examination *before commencing their regular medical studies*, taking a preliminary year for the purpose of preparation. In this way much knowledge will be gained which will go to clear the way for his first year's studies, which would otherwise be much encumbered. The medical degrees of the university are Bachelor and Doctor of Medicine, Bachelor and Master in Surgery, and Bachelor and Doctor of Science. There are at each stage of the graduate's career examinations for honours, which afford the student the opportunity of gaining highly-prized distinctions in various branches. There are prizes, exhibitions, and scholarships for the most successful.

Certain changes have recently been made in the regulations for the University of London's degrees of Bachelor and Doctor in Science. It has come to be generally felt that scientific knowlege, to be real, must be practical as well as theoretical, and that a thorough knowledge limited to a comparatively small range is preferable to a slighter acquaintance spread over a more extended area. In the first examination for Bachelor of Science, which every candidate will be required to pass, while the programmes in mathematics, experimental physics, and inorganic chemistry have been carefully revised, little fundamental change have been made in them. In place of the superficial acquaintance with both zoology and botany formerly required at this examination, there is a single examination (written and practical) in general biology, in which a more thorough knowledge is required of the simplest forms and elementary phenomena of animal and vegetable life. The regulations for the second B.Sc. examination, on the other hand, are framed with the view of allowing the candidate to bring up any three of the following nine subjects:—(1) Pure mathematics, (2) mixed mathematics, (3) experimental physics, (4) chemistry, (5) botany, including vegetable physiology, (6) zoology, (7) animal physiology, (8) physical geography and geology, (9) logic and psychology. Moreover, in the matricular examination, which forms the basis of the science curriculum, German may now be taken in substitution for Greek. In regard to the Doctor's Degree, a change has been made in favour of candidates who prolong the interval between their first and second examinations for the degrees of Bachelor from one year to two or more, as such will be allowed to come up for the degree of Doctor of Science within a year of their attaining the degree of Bachelor.

UNIVERSITY OF DURHAM.

Two licences and three medical degrees are conferred by this university—viz., licence in Medicine and Surgery, and the degrees of Bachelor of Medicine, Master in Surgery, and Doctor of Medicine.

The candidate for a licence in Medicine must have been engaged in his professional subjects for four years after registration, and one of those four years must be spent at the University of Durham. The regulations for the licence in Surgery are similar to those for the licence in Medicine.

With regard to the degree of Bachelor of Medicine, no one will be admitted to that degree unless he has kept one year's residence in Arts at the Durham University College of Medicine, and has passed both the final examination for the degree of Bachelor of Arts, or an equivalent to it, and also the examination for the degree of Bachelor of Medicine.

No grace for the degree of *Doctor of Medicine* will be granted unless the petitioner is a Bachelor of Medicine of the standing of twenty-one terms (seven years) at least from his registration or matriculation, and of three terms at least from his admission to the degree of Bachelor of Medicine, nor unless he has written an essay based on original research or observation on some medical subject selected by himself, and approved of by the Professor of Medicine.

There is also an examination for the degree of Doctor of Medicine for medical practitioners of fifteen years' standing, *without residence*, and in which, unless he has previously passed an examination in Arts, he is examined in classics and mathematics.

THE ROYAL COLLEGE OF PHYSICIANS OF LONDON.

The high position which this venerable College holds among the corporations is too generally acknowledged to require any particular attention being drawn to it. And it is gratifying to know that this College has lost none of its prestige by sympathising and becoming more associated with the general body of practitioners. Its licence is an honourable one, the examination for this licence very fair and up to a good standard, and we are surprised that students are not more ambitious than they are to enter the profession through its portals.

THE FELLOWSHIP.—The Fellowship of this College is attainable only by election, and no one can be proposed who is not a member of at least four years' standing.

THE MEMBERSHIP.—A person may become a member of this College without holding a degree in medicine, or, indeed, any diploma. But every candidate who shall have commenced his professional studies after September, 1861, shall satisfy the Censors' Board that previously to the commencement of his professional studies he has obtained a degree in Arts from some university of the United Kingdom or of the Colonies, or from some other university specially recognised by the Medical Council, or that he has passed examinations equivalent to those required for a degree in Arts. The curriculum extends over five years.

Graduates in Medicine of any British university are admitted to an examination for the Membership. Such graduates are exempt from some parts of the examination —*e.g.*, anatomy and physiology. Even graduates of accredited foreign universities have no difficulty in being admitted to examination. All persons who have been admitted before February 16, 1859, licentiates of the College, and also all extra-licentiates who are not engaged in the practice of pharmacy, may be proposed to be admitted a Member of the College. Every candidate for the membership is expected to pass an examination, but there are certain cases, referred to under sections 15, 16, and 17 of the by-laws of the College, in which the candidate is exempted from some portion of the examination.

THE LICENCE.—The Licence of this College is a qualification to practise medicine, surgery, and midwifery, and is recognised by the Poor-law Board as a qualification in surgery as well as in medicine, but unless a graduate of some university, he is forbidden to use the title of doctor, but we regret to say many do so. It was regarded at first as a diploma for the general practitioner, intended to supersede that of the Apothecaries' Company. The examination is conducted by specially-appointed examiners, and is complete in the several departments. There are two examinations for the Licence, the *first* of which may be passed after the termination of the second winter session, while the *second* examination cannot be passed until after four years of professional study. The fee for the College licence is fifteen guineas, of which five are to be paid on admission to the first examination.

Every candidate for the College Licence will be required to produce satisfactory evidence of having completed the course of study in accordance with the by-laws and regulations of the College, which may be obtained of the Registrar, and to pass the professional examinations conducted by the Examining Board.

Nearly eight years ago the most important change occurred that has ever taken place in reference to the qualifications of general practitioners. This Licence of the London College of Physicians was then recognised by the Poor-law Board as a qualificatiou in surgery as well as medicine. Consequently, this single diploma is sufficient to enable anyone to take a Poor-law appointment. Anyone contented with the diploma of L.R.C.P. Lond. would then have all he needed as a legal qualification.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

No College has exercised more influence over the pro-

fession than this. Without the M.R.C.S. it is not easy to obtain any English surgical appointment. Its membership, although no longer essential, yet carries great weight in a parish appointment. For this reason most English students take this diploma, which, together with a medical qualification, suffices for every purpose of the general practitioner. The College gives four diplomas, the Membership, Fellowship, a diploma in Dental Surgery, and one in Midwifery, which last is, however, mostly confined to those who are already members.

THE MEMBERSHIP.—This diploma gives no vote in the affairs of the College. It is only a licence to practise, and corresponds with the licentiateship of the Edinburgh and Dublin Colleges.

In future, candidates for the diploma will be examined in the Practice of *Medicine*, although there are certain conditions on which he can claim exemption. He must also have passed the preliminary examination of the College, or one that is recognised by the College. There are now two professional examinations for the Membership, the Primary and the Pass.

THE FELLOWSHIP.—Members of long standing are often admitted to the Fellowship by election. As, however, this grade is obtainable by examination, is of greater value, and needs no personal influence, men who have sufficient time and ability prefer the F.R.C.S. after exam.

For the Fellowship he must be a Member of the College of eight years' standing, and is admitted to examination on producing a certificate signed by three Fellows to the effect that he has been engaged in the Practice of Surgery for eight years, and is a fit and proper person to be admitted a Fellow.

Few consulting surgeons in England are without the Fellowship, and in most of the London hospitals appointments are unattainable without it.

APOTHECARIES' SOCIETY OF LONDON.

The Licence of the Society of Apothecaries is perhaps the most useful medical diploma for the general practitioner in England. The monopoly enjoyed by this body for many years, in this respect, is not easily to be disturbed. The laws of many institutions require their medical officers to hold this diploma, and these laws are not readily altered. Though other medical qualifications are recognised by the Poor-law Board, there is no doubt that the guardians throughout the country—and they elect the medical officers—are familiar with the diploma of the Apothecaries' Society, and it is to them more of a guarantee than other qualifications of which they are ignorant. Everyone, therefore, intending to settle in *England* as a general practitioner—even if he take other diplomas—would probably consult his own interest by taking up the L.S.A.; and as the fee is only six guineas, a very large number of young men will, no doubt, secure this avenue to appointments.

NOTES ON THE HOSPITALS AND MEDICAL SCHOOLS IN LONDON:

CHIEFLY IN REFERENCE TO THE PRIZES, SCHOLARSHIPS, AND APPOINTMENTS OPEN TO STUDENTS.

ST. BARTHOLOMEW'S HOSPITAL.

This ancient and popular hospital receives within it walls upwards of 6,000 in-patients annually. The clinical practice comprises a service of 710 beds, of which 322 are allotted to surgical cases, 227 to medical cases, 26 to diseases of the eye, 20 to diseases of women, and 81 to syphilitic diseases, while 34 are for convalescents at Highgate. Four house physicians and four house surgeons are appointed annually. There are no fees payable for House Physiciancies and Surgeoncies. The midwifery assistants, the ophthalmic house-surgeons, the clinical clerks, and the out-patient clerks and dressers are appointed, without fee, from among the diligent students. Sixteen free in-patient dresserships are awarded annually; other dresserships may be obtained on payment of the usual fees. The assistant chloroformist is appointed annually, and receives rooms and a salary of £25. Accommodation is provided for residence of students in the college connected with the institution, for which an entrance fee of £2 2s. is required. By applying to the resident warden, Dr. Moore, students may obtain information respecting rooms in the college, or will be advised as to residence out of the hospital. The following scholarships and prizes are awarded. Open Scholarships in Science of the value of £100 each tenable for one year, and competed for September 26th. The subjects of examination are Physics, Chemistry, Botany, and Zoology. Preliminary Scientific Exhibition, of the value of £50, tenable for one year, and the examination, which is in the subjects above mentioned, is confined to students of the hospital of less than six months standing, and is awarded in October. Two Brackenbury scholarships in Medicine and Surgery respectively.—Lawrence Scholarships and gold Medal of the value of £80. The Jeaffreson Exhibition, of the value of £20 yearly, and tenable for two years, is awarded, in October, to the student who passes the best Examination in the subjects of General Education—A Senior Scholarship, £50, in Anatomy, Physiology, and Chemistry.—Junior Scholarships in the subjects of study of the first year: 1, £50; 2, £30; 3, £20.—The Wix Prize is awarded for the best essay on a given subject.—The Bentley Prize for the best report on Surgical cases occurring in the wards of the hospital during the previous year.—The Hichens Prize for the best examination in "Butler's Analogy."—Foster Prize for the best examination in Practical Anatomy (senior)—The Treasurer's Prize for the best examination in Practical Anatomy (junior). The Kirkes Gold Medal for Clinical Medicine.

CHARING-CROSS HOSPITAL.

This hospital derives from its situation great advantages. It is in the very centre of London, where there is constant communication with every part. During the present year some very extensive alterations have been undertaken, which have rendered this hospital and its medical school worthy its splendid position, and given it a claim to be reckoned amongst the most important of the metropolis. Since the opening of the new wards a few months since by their Royal Highnesses the Prince and Princess of Wales, nearly 200 beds are placed at the disposal of the staff for clinical teaching. In connection with it the practice of the Royal Westminster Ophthalmic Hospital, close by, containing 50 beds, is open to matriculated students, and affords an excellent opportunity for the study of that branch of the profession. There are also other special branches taught in the school, skin and mental diseases, and public health amongst the number.

The following scholarships are open to students:—Two entrance scholarships, of the value of £30 and £20 respectively tenable for one year, are awarded annually. Two scholarships are open for competition to matriculated students—the Llewelyn Scholarship of £25, for those who have just completed their second year; and the Golding Scholarship of £15, for those who have just completed their first year. The Pereira Prize of £5 is open to all matriculated students, the award being for the best clinical reports. The Governors' clinical gold medal, and silver and bronze medals in all classes are awarded annually.

There are clinical clerkships and dresserships, as at the other hospitals, and assistant surgical and medical officers to those further advanced in their hospital course. The fee for the three years' course of study, including matriculation fee, is £80 7s., payable in five instalments. Dental surgery is taught on payment of a composition fee, including matriculation, of £42 2s. Students are also admitted without matriculation to the medical and surgical practice of the hospital for the full period required by the University of London, the Colleges of Physicians and Surgeons, on payment of a fee of 30 guineas.

GUY'S HOSPITAL.

This hospital is situated close to the London Bridge Railways. Hence great facilities for getting to any part of London or the country. It is quite practicable for students to reside a little distance down either of the lines that converge at this point, and thus enjoy the benefit of country air during their hospital career. The appointments are numerous. House physicians and surgeons, obstetric residents, dressers, and clinical clerks are selected from the students according to merit and without payment.

There is an open scholarship of the value of £105 in Classics, Mathematics, and Modern Languages; and one of the value of £105 for Science. The prizes are: At the end of the summer session in Anatomy, Physiology, Chemistry, Materia Medica, Botany, and Comparative Anatomy—First prize, £50; second, £25; and third, £10 10s. For Students in their second year: The Joseph Hoare Prizes—First prize, £25; second prize, £10. Subjects: Anatomy, Physiology. The Sands Cox Scholarship, of £15 per annum for three years. Subjects: Physiology and Elementary Physics. The Michael Harris Prize, of £10 for Anatomy—For Students in their third year: First prize, £35; second prize, £20. Subjects: Medicine, Surgery, Midwifery, and Medical Jurisprudence—For Senior Students: The Treasurer's Gold Medal in Medicine; the Treasurer's Gold Medal in Surgery; the Gurney Hoare Prize of £25, for Clinical Medicine and Surgery. The fees for hospital practice and lectures are—First year, £40; second, £40; and third, £30; or on payment of 100 guineas a student is entitled to a perpetual ticket.

ST. GEORGE'S HOSPITAL.

This hospital contains 353 beds, of which 205 are devoted to surgical, and 148 to medical cases. One great advantage to students is its unrivalled position, at the corner of Hyde Park, one of the most salubrious parts of the metropolis.

All the medical appointments, including those of house-physician, house-surgeon, clinical clerks and dressers, are awarded to pupils, without additional fee, after examination.

The following paid offices are awarded yearly, upon the recommendation of the Medical School Committee—viz., Obstetric Assistant, with a salary of £100 and board and residence; Curator of the Museum, Medical Registrar, Surgical Registrar, and Demonstrator of Anatomy, with a salary of £50 each.

Among the most valuable prizes, &c., are:—The William Brown Exhibition of £100, tenable for two years, to be competed for by perpetual pupils who have recently obtained their diploma. Another of £40, tenable for three years, for fourth year students. The annual Brackenbury Prize of £35 each in Medicine and Surgery. The Treasurer's Clinical Prize of £10 10s. Sir Benjamin Brodie's Clinical Prize in Surgery, and Dr. Acland's Clinical Prize in Medicine. There are also general Proficiency Prizes, of £10 10s. each, to first, second, and third years' pupils.

A compounding fee of 40 guineas each the first and second years, and 10 guineas each succeeding year, admits to the hospital practice and lectures required for the diplomas of the Colleges of Physicians, Surgeons, &c. For a perpetual ticket 100 guineas. Students in dental surgery are also admitted to the lectures and hospital practice required for the L.D.S. on payment of a fee of £45. Valuable prizes are given to successful students, and there is also a William Brown exhibition of £100 per annum, tenable for two years.

Those who have commenced their professional studies at any of the English Universities will be admitted as perpetual pupils on payment of a reduced fee, calculated on the proportion of lectures from which they can claim exemption by producing certificates which will be accepted by the licensing bodies.

KING'S COLLEGE.

This College is situated close to Somerset House, in the Strand, having a frontage on the new Thames embankment, within a few minutes' walk of several railway stations. The physician's assistant, physician-accoucher's assistant, and house-surgeon, as also their assistants, clinical clerks, and dressers, are selected by examination from among the students, without extra fee.

The scholarships and prizes are very numerous at King's, and comprise—Warneford Scholarships.—Students entering the medical department of this College in October will have the exclusive privilege of contending for three scholarships of £25 each for three years. The subjects may be ascertained by applying to the secretary. Five medical scholarships are awarded at the close of each winter session for proficiency in professional subjects—viz., one of £40 for two years, one of £30 for one year, and three of £20 for one year. Sambrooke Registrarships.—Two of £50 tenable for two years. Daniell Scholarship.—One of £20 for two years, for proficiency in chemistry. Science Scholarship.—One annually of £25 for two years, given by the Clothworker's Company. Endowed prizes of the value of £25, £15, £10, and £4 4s. each, and college prizes of the value of £60 are annually awarded.

The fees, amounting to £105, may be paid either in one sum of £100 on matriculation, or in three amounts at the commencement of each winter session.

Special courses of lectures are given to meet the requirements of the University of London for their Preliminary Scientific Examination.

THE LONDON HOSPITAL.

The Medical College of the London Hospital has been greatly enlarged of late, and with its splendid hospital presents as fine a field for practical study, especially for surgery, as any in the metropolis. The government of this college has been re-constituted, every department supervised, and a secretary appointed to ensure proper discipline, and promote the general improvement. There are now a large number of scholarships and prizes of considerable value, but more important still to studious men, all the numerous appointments in the wards are open to pupils without extra payment, and the value of the dresserships, clerkships, house-surgeoncies, house-physiciancies, and other residential positions in a hospital of the first magnitude are always considerably enhanced where the staff take such interest in the development of its educational resources as at the London. The hospital contains 800 beds, and the number of in-patients last year amounted to nearly 9,000. There is a first-rate Pathological Department under the supervision of Dr. Sutton, and constitutes a part of the "Grocer's Wing" lately erected.

There are two entrance scholarships in Natural Science of the value of £60 and £40 respectively. Two Buxton Scholarships for students who distinguish themselves most in the subjects appointed by the General Medical Council as the subjects of the preliminary examinations. A scholarship, value £20, to the first-year student who shall pass in April, 1878, the best examination in Human Anatomy. A scholarship, value £25, to the first-year or second-year student who shall pass at the end of the winter session the best examination in Anatomy, Physiology, and Chemistry. A hospital scholarship, value £20, for proficiency and zeal in Clinical Medicine. A hospital scholarship, value £20, for proficiency and zeal in Clinical Surgery. A hospital scholarship, value £20, for proficiency and zeal in Obstetrics (awarded at the end of June, 1878), besides several valuable prizes.

ST. MARY'S HOSPITAL AND MEDICAL SCHOOL.

This hospital is located, together with the medical school, at Paddington, in close proximity to the Great Western Railway Terminus. Many of the pupils take advantage of the railway, and reside some few miles in the country, coming to town daily to attend the hospital practice and lectures. Students with slender purses will find the neighbourhood of the hospital a moderate one as regards lodgings, and easy of access by omnibus and the Underground Railway from all parts of London. This hospital was the first in which departments were made for the study and treatment of special diseases, and at the present time there are special departments for diseases of women and children, of the eye, the skin, and the throat, in which clinical demonstrations are constantly given by the physicians and surgeons in charge. Three resident medical officers are appointed for twelve months, and an obstetric officer for six months, who board free of expense in the hospital. A resident registrar is also appointed from among the students, with a salary of £100 a year. These appointments are awarded after competition, without additional fee. In addition to the above, a demonstrator of anatomy is appointed annually, with a salary of £100 a-year, and the medical tutor in like manner, with a salary of £100 a-year. There are three scholarships in natural science, each tenable for three years, of the value of £60 the first year, £40 the second year, and £20 the third year; an exhibition in natural science of £20 for one year; a scholarship of £20 in anatomy, carrying with it the appointment of assistant demonstrator; a scholarship of £20 in pathology, carrying with it the appointment of assistant curator; and an extra science scholarship of £100, also some extra prizes, particulars of which may be had of the Dean, Dr. Shepherd. Two of the above scholarships will be awarded by open competitive examination, in October, 1877; one in natural science, tenable for three years, of the value of £60 the first year, £25 the second, and £15 the third; the other in classics and mathematics, tenable for one year, and of the value of £35.

MIDDLESEX HOSPITAL.

This hospital contains 300 beds, 180 being devoted to medical and 120 to surgical cases. There is a special department for cancer cases, affording accommodation for 33 in-

patients, whose period of residence in the hospital is unlimited. Wards are also appropriated for the reception of cases of uterine disease, and of syphilis, and beds are set apart for patients suffering from diseases of the eye.

Two Broderip scholarships, of the annual value of £30 and £20, tenable for two years, and two clinical prizes are annually awarded to those students who pass the most satisfactory examination at the bedside, and in the post-mortem room. Two entrance scholarships, of the annual value of £35 and £20 respectively, will be offered for competition at the commencement of the winter session. Each scholarship is tenable for two years, and are open to all who commence their studies in October next. The examination will take place on September 28th and following days. The Murray medal and scholarship, in memory of the late Dr. John Murray, have been founded in connection with the University of Aberdeen, and will be awarded every third year to a student of this hospital. The governors' prize of twenty guineas, is awarded annually to the student who has most distinguished himself during his three years curriculum. Class prizes are also given, and six resident clinical appointments are annually awarded, after competitive examination, to students who have completed their education and complied with the regulations of the school. The officers thus appointed reside and board in the hospital free of expense. Clinical clerks and dressers are also appointed for six months, and are so arranged that every student may hold both a clerkship and a dressership at some period of his attendance on hospital practice.

The general fee for the curriculum required by the Royal College of Physicians and Surgeons and the Society of Apothecaries is £90, which may be paid by instalments. Fee for dental students, 40 guineas, which may also be paid by instalments.

ST. THOMAS'S HOSPITAL.

This magnificent building, or rather series of buildings, is situated at the foot of Westminster bridge, on the south bank of the Thames, facing the Houses of Parliament. From its proximity to some of the largest factories in London, it affords scope for surgical practice from accidents second to none, whilst amongst the members of its staff are names of European reputation in medicine and science.

There is accommodation for residence and free maintenance in the college-house for the resident assistant physician, resident assistant surgeon, two house-physicians, the resident accoucheur, two house-surgeons, one dresser, one obstetric clerk, and an assistant obstetric clerk, which appointments are awarded by competition. There are many prizes and scholarships. For first year's students: Two entrance Scholarships in Natural Science of the value of £60 and £40. The Wm. Tite Scholarship of £30, awarded annually—College Prizes—£20 and £10; summer, £15, £10, and £5. For Second-year's Students: the College Scholarship of 40 guineas, and the Musgrove Scholarship of 40 guineas per annum, awarded biennially to the student who shall take the highest place in the first-class list in the examinations at the end of the second winter session. For this and the next year College Prizes same as for first year. Clinical clerks and dressers are selected according to merit. The Grainger Testimonial Prize of £20, awarded biennially to third or fourth year's students, for the best Physiological Essay, to be illustrated by preparations and dissections; and Cheselden Medal, for Surgery and Surgical Anatomy; and the Mead Medal, awarded annually to fourth-year's students in respect of a special practical examination in Medicine. The Solly Medal, with a prize of at least 10 guineas, awarded biennially to a student of the third, fourth, fifth, or sixth year, for the best report of Surgical Cases. The Treasurer's Gold Medal, for general proficiency and good conduct, awarded annually to a fourth year's student. The admission fee to practice and all the lectures is £40 for the first year, a similar sum for the second, £20 for the third, and £10 for each succeeding year, or £105 at one payment for unlimited attendance. Special entries may be made to any course of lectures or to the hospital practice, and a modified scale of fees is arranged for students entering in their second, third, or any subsequent year. Fee for general subjects required for students of dental surgery for two years, £45, or by instalments of £40 for the first year, and £10 for the second year. All students have the opportunity afforded them of being engaged in the performance of practical duties in connection with the medical, surgical, obstetrical, ophthalmic, and pathological departments in the hospital.

UNIVERSITY COLLEGE AND HOSPITAL.

Few colleges in London have of late years been so successful as this, both in its annually increasing number of students and in the number of those who subsequently pass their several colleges on first presentation. The College, which is situated in Gower Street, about 100 yards from the hospital, gives instruction in every department of science, and specially prepares students for degrees in all the faculties at the University of London. As appears from the Fifth Report of the Royal Commission on Scientific Education, about one-third of the various degrees conferred by the University of London have been obtained by students from University College, although the University is open to candidates from every part of the British Empire, including the Universities of Oxford and Cambridge, besides a numerous body of colleges and other institutions in India, the various Colonies, and not a few Continental institutions. There are numerous scholarships open to the students of the college. There is the Surgical Fellowship, value £45 per annum for three years; the Physiological, value £70; Pathological Anatomy, £30; the Cluff Prize for Anatomy, Physiology and Chemistry; besides various other prizes and medals. There are also annually awarded three Entrance Exhibitions, of the respective values of £30, £20, and £10 per annum, tenable for two years, the subjects of examination being Classics, Mathematics, Natural Philosophy, and either French or German. The fees are much the same as at the other medical schools.

WESTMINSTER HOSPITAL.

The school attached to this Hospital is the smallest in London. Its situation, however, is very convenient, near the Abbey and the Houses of Parliament. Lodgings are also very reasonable in the neighbourhood, and the school is one of the most moderate in respect to fees. The hospital contains 191 beds, and received during the past year more than 2,000 in-patients and 18,000 out-patients. There are separate departments for diseases of the eye, ear, skin, teeth, and diseases peculiar to women. In addition to the practice of the hospital, pupils who enter for the whole period of medical education are like those at the Charing Cross school, permitted to attend without further fee the practice of the Royal Westminster Ophthalmic Hospital, and that of the National Hospital for Paralysis. The whole course of study for the usual examinations may be here completed for £80, payable in two instalments. The perpetual fee is only 80 guineas, or £78 in one sum on entrance. The scholarships are not so valuable as at some of the larger hospitals, but they are sufficient to induce students to employ their time to the best advantage, and are as follows: Exhibition in Anatomy and Physiology, value £10 10s., for first year's men. Prize of £2 2s., for diligence in the dissecting-room, for first year's men. A Scholarship in Anatomy and Physiology, value £21, tenable for one year, for second year's men. Prizes for histology, midwifery, clinical medicine and pathology, and for clinical surgery and pathology. The Frederick Bird Medal and Prize, for students who have completed their fourth year. Subjects: medicine, midwifery, diseases of women and children, and pathology; and the Chadwick Prize, £21, for general proficiency. There are also two Entrance Scholarships of £50 and £10 each, tenable for two years.

Resident appointments, clerkships, &c., are all conferred without extra payment. The medical and surgical registrars receive each a salary of £40.

SCHOOL OF MEDICINE FOR WOMEN.

This school was opened two years ago at Henrietta Street, Brunswick Square, for the purpose of giving to women the advantages of a complete course of medical education, though at that time no qualifying examination was open to them. Now the College of Physicians of Dublin and the University of London have resolved to admit women to examination, and in addition the authorities and medical staff of the Royal Free Hospital have undertaken to supply them with clinical instruction and ward practice.

The Session will commence in October with the course of lectures for first-year's students. No male students are admitted to the lectures in the school, nor are they allowed in the wards of the hospital during the instruction of women students, so that mixed classes, so distasteful both to the medical profession and to the public, are avoided. Two entrance scholarships of the value of £30 and £20 respectively, will be awarded according to the results of a competitive

examination, to be held on October 1st, 1877. Intending candidates should apply, at least ten days before the date of examination, to Mrs. Thorne, Hon. Sec., at the School.

LONDON SCHOOL OF DENTAL SURGERY.

This institution, which is situated in Leicester Square, is the only recognised school of dental surgery in London. The meetings of the Odontological Society are also held here. In winter lectures are delivered on Mechanical Dentistry by Mr. J. S. Turner, on Wednesdays, at 7 p.m. ; on Metallurgy, in Dentistry, by Mr. G. H. Makins, on Tuesdays and Fridays, at 6.30 p.m. In summer Mr. S. H. Cartwright lectures on Dental Surgery and Pathology, and Mr. C. S. Tomes on Dental Anatomy and Physiology. General fee for special lectures required for the curriculum, £15 15s. In connection with the above is the

DENTAL HOSPITAL OF LONDON.—Surgeons : Messrs. Fox, Medwin, Gregson, Coleman, Harding, and Hill. Assistant-Surgeons : Messrs. Moon, Bartlett, Hepburn, Gibbings, Woodhouse, and Hutchinson. Dental House-Surgeon : Mr. M. L. Read. Assistant Dental House-Surgeon : Mr. Fothergill. Fee for two years' hospital practice, £15 15s.

THE BLOOMSBURY SQUARE SCHOOL OF PHARMACY.

The thirty-sixth session of this school commences on October 1, 1877, terminating July 31, 1878. Chemistry and Pharmacy, Prof. Redwood, F.C.S. ; Botany and Materia Medica, Prof. Bentley, F.L.S. ; Practical Chemistry, Prof. Attfield, F.C.S. The object of this school is to provide sound instruction, not in the practice of Pharmacy, but in the principles on which the practice of Pharmacy should be based. Lectures are given on Chemistry, Chemical Physics, Pharmacy, Botany, and Materia Medica. A good laboratory is provided for instruction in Practical Chemistry ; and there are also a library, reading-room, and museums. Various prizes, medals, &c., are given to successful students. Fees payable in advance :—Botany and Materia Medica, one course (five months) £2 2s. ; an entire session (two courses) including Systematic and Practical Botany, £3 3s. ; Systematic and Practical Botany, separately, £1 1s. ; perpetual admission to all the courses, £4 4s.

SOUTH LONDON SCHOOL OF PHARMACY.

This school is situated in the Kennington Road, and is decidedly the most popular institution for the study of Practical Pharmacy and Chemistry in London. Instruction is also given in Analytical Chemistry for the purpose of qualifying gentlemen in search of appointments under the Public Health and Adulteration of Food Acts, by the Principal, Dr. Muter. Lectures are delivered daily in the Laboratory, and each student is required to practically illustrate the subject taught as the lecturer proceeds. The winter session commenced yesterday.

SCHOOL OF HOMŒOPATHY.

Until recently Homœopathy has had no recognised teaching school for students ; now there exists an institution in Great Ormond Street, where lectures and instructions according to homœopathic principles are given by duly qualified members of the medical profession, and where students who believe in the *similia similibus curantur* theory can be taught according to their bent. The winter session at this school opens on Oct. 2nd with an Introductory Address by Dr. Richard Hughes.

NOTE.—*Where fuller information is required by the reader than that contained in the foregoing notes, it will generally be found on reference to our advertising columns, where also will be found the names of the staffs, lecturers, &c.*

HOURS OF THE INTRODUCTORY LECTURES

To be delivered on Monday, Oct. 1, *at the different Metropolitan Schools.*

Charing-Cross Hospital—Mr. J. A. Bloxam.—4 p.m.
St. George's Hospital—Mr. Pick—4 p.m.
Guy's Hospital—*Conversazione.*—8½ p.m.
King's College Hospital—Prof. Lister.—4 p.m.
London Hospital—*Conversazione.*—8 p.m.
St. Mary's Hospital—Mr. Herbert Page.—3½ p.m.
Middlesex Hospital—Mr. A. Hensman.—3 p.m.
St. Thomas's Hospital—Mr. Wagstaffe.—4 p.m.
University College—Dr. Williams.—3 p.m.
Westminster Hospital—Dr. Grigg.—3 p.m.

THE PRINCIPAL METROPOLITAN HOSPITALS TO WHICH NO MEDICAL SCHOOL IS ATTACHED.

Open to Students from the larger Hospitals.

BETHLEM HOSPITAL.—This Hospital is open for the admission of two resident medical students, who have recently obtained their diplomas to practice Medicine and Surgery, for the acquisition of knowledge regarding the Insane. The next election takes place on the 8th of October, at Bridewell Hospital, and the elected candidates will be expected to commence residence on the 1st of November.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park.—This is a large and important hospital at the East End, containing 164 beds. Consulting Physicians: Drs. T. B. Peacock, J. Risdon Bennett, E. Lloyd Birkett. Consulting Surgeon : Mr. John Hilton, F.R.S. Physicians : Drs. S. H. Ward, J. Andrew, J. C. Thorowgood, Shepherd. Assistant-Physicians : Drs. Eustace Smith, J. B. Berkart, Evans, and Fothergill.

EAST LONDON HOSPITAL FOR CHILDREN.—Physicians : Drs. Barnes, Andrew Clark, Eustace Smith, and Horatio B. Donkin. Assistant-Physicians : Drs. Warner and Crocker. Surgeons: Messrs. B. Shillitoe, A. Cæsar, H. A. Reeves. Assistant-Surgeon : Mr. R. W. Parker. House Surgeons : Messrs. Spooner and J. Cæsar. Secretary : Mr. Ashton Warner.

GREAT NORTHERN HOSPITAL, Caledonian Road.—Physicians : Drs. Leared, Cholmeley, Crucknell, Cooke, Bridges. Obstetric Physician : Dr. Gustavus C. P. Murray. Consulting Surgeon : Mr. F. Le Gros Clark, F.R.S. Surgeons : Messrs. Gay, W. Adams, T. Carr Jackson, W. Spencer Watson, and W. H. Cripps. Ophthalmic Surgeon : Mr. Lowne. Aural Surgeon : Mr. A. E. Cumberbatch. Dental Surgeon : Mr. C. J. Fox. Chloroformist : Mr. Eastes. House Surgeon : Mr. T. H. Gillam.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.—This is the largest institution for the treatment of affections of the chest in the United Kingdom, and contains 257 beds. Consulting Physicians : Drs. C. J. B. Williams, W. H. Walshe, R. B. Cotton, and R. Quain. Consulting Surgeon : Prof. John Marshall, F.R.S. Physicians : Drs. J. E. Pollock, E. S. Thompson, C. T. Williams, R. D. Powell, and J. Tatham. Assistant Physicians : Drs. R. Thompson, Burney Ye, F. Roberts, T. H. Green, and J. M. Bruce. Three clinical assistants reside in the hospital for a period of six months. Pupils are admitted to the practice of the hospital. Terms, £3 3s. for three months ; perpetual, £5 5s.

BRITISH LYING-IN HOSPITAL, Endell Street, St. Giles's, W.C. —Consulting Physician : Dr. Priestley. Consulting Surgeon : T. Spencer Wells, F.R.C.S. Physicians : Drs. Heywood Smith, Arthur Edis, and S. Fancourt Barnes. This institution receives women only, as midwifery pupils. The fee for the course of three months is £10 10s. Pupils who prove themselves competent receive a certificate signed by the physicians, enabling them to practise midwifery.

ROYAL INFIRMARY FOR CHILDREN AND WOMEN, Waterloo Bridge Road.—Instituted 1816. Consulting Physicians : Drs. Wilks and John Williams. Consulting Surgeon : Mr. J. Cooper Forster. Physicians : Drs. G. V. Poore, W. Park, G. Roper, and W. A. Sturge. Surgeon : Mr. Edwin Canton. Surgeon-Dentist ; Mr. Drury. Resident Medical Officer : Mr. E. Overman Day. Secretary : Mr. W. Champion. Advanced students in medicine are allowed to attend the practice of this hospital gratis.

WEST LONDON HOSPITAL.—A well appointed hospital at the western extremity of the metropolis in the Hammersmith Road containing 60 beds. Consulting Physician ; Dr. Maudsley. Consulting Physician-Accoucheur : Dr. W. O. Priestley. Consulting Surgeons ; Messrs. S. A. Lane and William Bird. Physicians : Drs. Goddard Rogers and Thorowgood. Physician for Diseases of Women ; Dr. Wiltshire. Surgeons : Messrs. W. F. Teevan and Alfred Cooper. Ophthalmic Surgeon ; Mr. B. J. Vernon. Junior Physicians : Drs. Fish and Fothergill. Junior Surgeons : Messrs. H. T. Butlin and Keetley. Surgeon-Dentist : Mr. H. E. Sewill. Analytical Chemist : Mr. William Crookes, F.R.S. Resident Medical Officers : Two House-Surgeons and an Apothecary. Gentlemen desirous of acting as clinical clerks or dressers can obtain all information by application to Mr. T. Alexander, at the hospital.

HOSPITAL FOR DISEASES OF THE THROAT, Golden Square, W. —Clinical Instruction and Laryngoscopic Demonstrations are given daily on cases under treatment. Consulting Physician : Dr. Billing, F.R.S. Consulting Surgeon : ——. Physicians : Drs. Morell Mackenzie, Semple, Prosser James, and Whistler. Surgeon : Mr. E. Woakes.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, Queen's Square, W.C.—This new building, recently opened by royalty, is probably the most magnificent children's hospital in Europe. There are now 104 beds in the hospital, and 52 beds at the country branch. In-patients last year, 1,274 ; out-patients, 9,149.

The staff consists of—Physicians: Drs. Dickinson, Gee, and Cheadle. Assistant-Physicians: Drs. O Sturges, R. Bridges, R. J. Lee, and Thos. Barlow. Surgeons: Messrs. T. Smith, F. Howard Marsh, J. W. Haward, and Mr. Owen. Surgeon-Dentist: Mr. A. Cartwright. Fee for three months' attendance, £3 3s.; perpetual, £5 5s. Secretary: S. Whitford. The practice of the hospital has been recently thrown open gratuitously to all hospital students on conditions which may be ascertained of the Secretary.

National Hospital for the Paralysed and Epileptic, Queen's Square, Bloomsbury.—Physicians: Drs. Ramskill, Radcliffe, Hughlings Jackson, and Buzzard. Physician for Outpatients: Dr. H. Charlton Bastian. Assistant-Physicians: Drs. Maclure and Gowers. Surgeon: Mr. W. Adams. Hon. Medical Superintendent: Dr. Herbert Tibbits. Resident Medical Officer and Registrar: Mr. H. R. O. Sankey. The hospital is open to students on presentation of their cards.

Seamen's Hospital (late *Dreadnought*), Greenwich.—For the reception of seamen of all nations who are received at all hours. Apartments are provided in the house of the surgeon for students and others who may be desirous of studying diseases incidental to tropical climates before entering the services or going abroad. Honorary Consulting Physicians: Drs. George Budd and Stephen H. Ward. Visiting Physicians: Dr. Charles Henry Ralfe and Mr. Harry Leach. Honorary Consulting Surgeon: Mr. Geo. Busk. Visiting Surgeon: Mr. N. Davies-Colley. Surgeon: Mr. W. Johnson Smith. House-Physician: Dr. H. H. Murphy. House Surgeon: Mr. Frederick Shann. Secretary: Mr. Henry C. Burdett.

London Fever Hospital, Islington.—260 beds. Consulting Surgeon: Mr. W. S. Savory. Consulting Physicians: Drs. Tweedie and Murchison. Physicians: Drs. Broadbent and Cayley. Resident Medical Officer: Mr. S. F. Murphy.

Royal Hospital for Diseases of the Chest, City Road, E.C.—This hospital treats nearly 6,000 out-patients annually, and makes up 26 beds. A new wing, of which the foundation stone was laid by Princess Louise, will raise the number of beds to over 60. Consulting Physicians: Drs. Herbert Davies and Horace Dobell. Physicians: Drs. G. Goddard Rogers, P. J. Hensley, Gilbert Smith, and D. W. Finlan. Consulting Surgeon: Mr. J. Adams. Surgeon: Mr. Walsham. House Physician: Mr. Williams. The office of House Physician, which is tenable for one year, and for which a sum of £80 is given in lieu of board, is filled up annually in October.

Central London Throat Hospital, Gray's Inn Road.—The new building, in its incomplete state, contains but 10 beds, but provision is made for 40. The staff consists of Mr. Carr Jackson, Consulting Surgeon, and Messrs. Lennox Browne and Llewelyn Thomas, Surgeons. Six clinical assistants, being either qualified practitioners or students of three years' standing, are elected to assist the surgeons. There are no fees.

Royal London Ophthalmic Hospital, Bloomfield Street, Moorfields, is the largest of its size in the metropolis, and contains 70 beds. Consulting Physician Dr. F. J. Farre. Consulting Surgeons: Messrs. J. Dixon, G. Critchett, and W. Bandman, F.R.S. Surgeons: Messrs. Wordsworth, Streatfield, Hulke, Lawson, Hutchinson, Cooper, Waren Tay, Adams, and Dr. Soelberg Wells. House Surgeons: Messrs. Gunn and Burnham. Number of patients annually, about 20,000.

Royal Orthopædic Hospital, 315 Oxford Street, W.—Surgeon: Mr. Brodhurst. House Surgeon: Mr. Baker. Operations at 2 p.m.

Royal Westminster Ophthalmic Hospital.—Consulting Surgeon: Mr. Henry Hancock. Surgeons: Messrs. Henry Power, James Rouse, and George Cowell. The hospital contains 50 beds. Operations take place daily at 1 p.m., and the practice is open to officers of the public service. Students are admitted on the payment of a fee of £3 3s. for six months; perpetual £5 5s. Students of the hospital are eligible for the post of House Surgeon.

Royal Free Hospital, Gray's Inn Road.—This hospital contains 102 beds. Of the smaller metropolitan hospitals few offer a more extensive field for students in medicine and surgery. An arrangement has recently been made by which medical students from the School of Medicine for Women will be enabled to attend their hospital courses at this institution. Physicians: Drs. O'Connell and Cockle. Surgeons: Messrs. F. Gant and Rose. Secretary: Mr. J. S. Blyth, from whom full particulars of the dresserships and clerkships may be obtained.

The Temperance Hospital.—The character of this institution is fully described by its title, and the non-alcoholic treatment is carried out in its entirety by an efficient staff. Much valuable information and instruction may be derived by a visit to this hospital, which is situate close to University College in Gower Street.

PRIVATE TUITION.

It is impossible to ignore the extent to which the system of private tuition is carried on both in and outside the medical schools. Nor is the practice to be altogether discountenanced, for although like everything else it is liable to abuse, it is under certain conditions a very legitimate means of assisting the medical student in the prosecution of his studies. "Grinding," "coaching," or whatever else it may be called, may be safe anchorage enough to the diligent hard-working student, but nothing better than a sunken rock on which the idle man is sure to be shipwrecked. We cannot too strongly censure the conduct of that man who wastes the greater part of his medical curriculum in frivolity, idleness, and dissipation, in the hope that two or three months' grinding may at the last enable him to scrape through the minimum examination of one of the licensing bodies. On the other hand, the anxious and diligent student may often get a good deal of assistance from both public and private tutors. There are many who although anxious to learn and to make progress in their medical studies, have not that happy knack of acquiring knowledge which some have. They have no order or method in their studies. They take too much in hand at once, or they devote an undue share of attention to subjects that are of little importance and neglect those which are all important, or they try to get the requisite information from a bulky volume, when a small manual would answer the purpose much better, or they fail in arranging and assimilating their knowledge, so that they do not know so much as they think they do, or cannot pass so good an examination as some who are far more ignorant than they are. Besides, in the lectures and in the more bulky treatises, the most essential facts and principles of a subject, which every student should endeavour to master first, are so often hidden among a crowd of details and irrelevant matter that he is apt to lose sight of them, or they make so little impression upon his mind that he soon forgets them. The tutor, however, can do much to smooth the path and clear away many of the obstacles that lie in the way of the medical student who is really anxious to acquire a competent knowledge of his profession; and he can put that knowledge in a more compact, more comprehensive, and more memorable form than the student could do without such assistance.

It is not for us to recommend any one tutor more than others, but those students who are not satisfied with the private tuition available at their own hospital can resort to the assistance of those public teachers whose advertisements will be found in this and most of the other medical journals. All we would urge upon them is never to trust to "grinding" and other forms of private tuition alone, but merely to make such means supplementary to the studious and rigorous attendance upon the lectures and hospital practice of the school at which they have entered.

Connected with private or supplementary education, there have recently been opened in London two schools—the School of Medicine at 102 and 104 Stamford Street, Blackfriars, of which Mr. Pearson, F.L.S., is a director and secretary; and the School of Anatomy, &c., at 16 Woburn Place, W.C., under the principalship of Mr. Thomas Cooke, F.R.C.S. Both of these schools are well conducted, and the teaching is entrusted to efficient hospital surgeons, who give their personal care to the requirements of individual students. At the former school Medicine, Surgery, and Science are the subjects to which attention is principally given. At the latter special instruction is given in Anatomy and Physiology by the well-known author of "The Tablets of Anatomy, Physiology, &c."

ENGLISH PROVINCIAL MEDICAL SCHOOLS.

Birmingham: Quen's College.

Students are admitted (1) as matriculated students who enter for their entire medical education; (2) as occasional students for one or more courses of lectures; (3) as junior students, to prepare for the preliminary examinations of the licensing boards.

Scholarships, Prizes, &c.—The Sands Cox Prize, value £20. Open to students who have completed their curriculum. Subjects: Medicine, Surgery, and Midwifery. Next examination in the third week in March, 1877. The Warden's Prize, value £5 5s., for first year's students, for general proficiency. The Percy Prize, value £5 5s., for German.

Fees.—College fees for all lectures amount to 50 guineas, payable by two equal instalments.

Hospital practice is obtained at the General and Queen's Hospitals, which have been amalgamated for the purpose of clinical instruction under the direction of the Birmingham Clinical Board, by whose order all schedules are signed and all examinations conducted. The hospitals have a total of upwards of 400 beds, and the staff attached is of a very high order.

All students will be required to attend six months alternately at each hospital, as directed by the Clinical Board, excepting students who enter the hospital for six months only.

Clinical Prizes,—The following prizes are given annually:—Senior Medical Prize, for third and fourth year's students, First Prize, £5 5s., Second Prize, £3 3s.; Senior Surgical Prize, for third and fourth year's students, First Prize, £5 5s., Second Prize, £3 3s.; Junior Medical Prize, for second year's students, First Prize, £3 3s., Second Prize, £2 2s.; Junior Surgical Prize, for second year's students, First Prize, £3 3s., Second Prize, £2 2s.; Midwifery Prize, £4 4s. The examinations for all the appointments and prizes are conducted by the Clinical Board, and are open for competition to all students registered by the Clinical Board.

Fees for attendance for four years on the medical and surgical practice, and on the clinical lectures at both hospitals, £31 10s. One year's attendance, £15 15s.; six month's attendance, £10 10s.; Special Department, for Midwifery and Diseases of Women (optional), £2 2s. Dental fee (optional), £1 1s.

Bristol School of Medicine.—Attached to this school, where there is ample provision for education and practice, are two well-appointed hospitals, the Royal Infirmary, containing 242 beds, and the General Hospital, with 154 beds.

Competitive examinations are held amongst students of the first, second, and third years respectively, and prizes of money, instruments, and books are awarded annually.

The certificates of this school are accepted by all the examining boards.

The general perpetual fee is 55 guineas.

Medical and surgical hospital practice and clinical lectures are attended at the Royal Infirmary or at the General Hospital, at which institutions additional prizes and scholarships are annually offered for competition amongst the students. Arrangements are in progress for the establishment in Bristol of a College of Science and Literature, of which the existing medical school will form a department.

Leeds School of Medicine.—Clinical lectures are given by the physicians and surgeons attached to the General Infirmary. Ophthalmoscopic demonstrations and demonstrations of skin diseases are given in the Infirmary by the surgeons in each department, where also are obtainable six clinical clerkships and eight dresserships.

Besides the Infirmary, there is a large Dispensary and a Fever hospital, both of which are open to students of the School.

Students at this School have excellent opportunities of acquiring a thorough insight of psychological medicine, as the renowned West Riding Lunatic Asylum is in connection, and Dr. Major lectures on Mental Diseases. The systematic lectures are given at the School, and the clinical lectures at the Asylum, which now accommodates 1,500 patients.

Special prizes of the value of £10 each are given in the classes of clinical medicine, clinical surgery, and forensic medicine. Silver and bronze medals and books are given in the class examinations.

Composition fee, entitling to attendance upon all the required courses of school lectures, 44 guineas. The fees for attendance upon the medical and surgical practice of the hospital are 20 guineas each for three years, and proportionally less for single sessions. The fee for the comparative anatomy course is not included in the composition fee.

Liverpool Royal Infirmary School of Medicine.—The Royal Infirmary attached to this School, which contains 300 beds with 40 special wards, for the treatment of diseases of women, is perhaps second to none in England in its general appointments and the facilities it offers to students for gaining practical knowledge. Four exhibitions, value £31 10s. each, consisting of free board and residence in the Royal Infirmary for six months, with dresserships, on award of the Medical Board. Six dressers and six clinical clerks are elected quarterly. Two house-physicianships and three house-surgeonships are open to pupils of the School, who have obtained a legal qualification.

Fees.—For six months' medical practice, 5 guineas; twelve months, 6 guineas. Surgical, 6 guineas for six months; 8 guineas for twelve months (this includes admission to the practice of the Lock Hospital adjoining the Infirmary). Perpetual medical and surgical practice, 32 guineas. On payment of a composition fee of 45 guineas on entrance, or in two equal instalments (one-half on entrance and the remainder within twelve months), the student is entitled to attendance on all the lectures and demonstrations (exclusive of practical chemistry) required for the membership of the Royal College of Surgeons, the licence of the College of Physicians and the Apothecaries Society.

Manchester: Owens College School of Medicine.—This School, as most of our readers are aware, has resulted from the amalgamation of the Manchester Royal Infirmary School of Medicine with the Owens College, and occupies in the provinces a somewhat similar position to that of University College and Hospital in London. It has a Faculty of Science as well as of Medicine, with departments of Laws and Arts. Since the amalgamation a new Medical School has been built, on the most approved principles, at the western extremity of the College estate. On the ground floor are two large lecture theatres, a library, and a museum. Over the lecture theatres is a dissecting-room, and over the library a physiological laboratory.

The course of instruction afforded to students is thoroughly complete. Three of the most important chairs, those of anatomy, physiology, and chemistry, are held by professors who entirely devote their time to the work of instruction.

Students wishing to engage in physiological or pathological researches will find opportunities for study in the complete and well-furnished physiological laboratory. Two valuable physiological scholarships are placed for competition in this branch as an incentive to original research.

Fees.—A composition fee, which may be paid in one sum of £48, or in two sums of £25 each at the commencement of the first and second years of studentship, admits to the whole of the lectures required to qualify for the examination for medical degrees in the University of London, the diplomas of the Royal College of Physicians, the fellowship and membership of the Royal College of Surgeons, and the licence of the Apothecaries' Society, and to attendance on the class of practical anatomy during two winter sessions. In addition to the composition fee, all students (except those who entered before the 1st May, 1873), will be required to pay the Medical Tutor's Fee, £2 2s. annually. Should a student desire to continue his study of practical anatomy beyond two sessions he can do so on payment of extra fees at the rate of £2 2s. for a three months', or £3 3s. for a six months' course.

An extra fee of £1 1s. will be charged for attendance on the demonstrations in the comparative anatomy class, and a like extra fee for the demonstrations in botany. A charge of £1 1s. is also made for the chemicals used in the class of practical chemistry.

Newcastle-on-Tyne College of Medicine. — This school is a department of the University of Durham, and contains ample provision for acquiring a sound education and practical experience at the bedside. It is smaller than some of the provincial schools, but with some parents and students this would be considered an advantage.

Hospital practice is obtained at the Newcastle Infirmary, which has 230 beds, and in which the required clinical lectures are delivered.

Scholarships and Medals.—Four Scholarships of £25 a year each, tenable each for four years. Dickenson Memorial Scholarship, £15, tenable for one year, for general proficiency. Tulloch Scholarship, £20, tenable for one year, for Anatomy, Physiology, and Chemistry. Charlton Memorial Scholarship, £35, tenable for one year, for Medicine. Four resident dressers, who also act as physician's clinical clerks, are chosen every six months from the senior students. Two assistants in the Pathological Department are chosen every six months.

Fee for hospital practice and clinical lectures, twelve months, £7 7s.; six months, £5 5s. Composition fee, £17 17s., or if paid by instalments, first year, £7 7s; second year, £6 6s.; third year, £5 5s. Composition fee to all the lectures, 50 guineas.

Sheffield School of Medicine.—Students at this College obtain excellent instructions in medical and surgical practice at the General Infirmary, which contains 200 beds, and is provided with a museum and pathological and post-mortem theatres.

The fees for perpetual attendance are £15 15s. for medical and £21 for surgical practice; for twelve months' medical and surgical practice, each £10 10s.; and for six months, £6 6s. each. There is also the Sheffield Hospital and Dispensary, containing 104 beds, and is recognised by the College of Surgeons and the Hospital for Diseases of Women, to which students are admitted.

The perpetual fee for attendance on all the lectures required by the Royal College of Surgeons and the Apothecaries' Hall, £42. Prizes to the value of £30, and certificates of honour, are given annually.

Some of the lecturers, and other local members of the profession, receive house pupils, which will be found far preferable to life in ordinary lodgings.

Liverpool Royal Southern Hospital.—This Institution is one of the largest in the English provinces, and contains 200 beds. It has no school proper, although it contains accomodation for resident pupils, and clinical lectures are delivered daily by members of the staff. These, together with the practice obtained here, which is of a very varied and valuable character, is recognised by all the Examining Boards. Inclusive fees—perpetual, 25 guineas; one year, 10 guineas; six months, 7 guineas; three months, 4 guineas. Students can enter to the medical or surgical practice separately on payment of half the above fees.

Note.—*Our advertising columns, of which an index will be found at the end of our editorial matter, will supply further information, with the names of staffs, &c., attached to the foregoing schools.*

HOURS OF THE INTRODUCTORY LECTURES.

To be delivered on Monday, October 1st, at the different Provincial Schools.

Durham University—Mr. B. Bramwell—Oct. 1st, at 2.
Queen's College, Birmingham—Dr. Basset—Oct. 2nd, at 3.30,
Leeds School of Medicine—Mr. J. A. Nunneley—Oct. 1st, at 3.30.
Sheffield School of Medicine—Dr. Banham—Oct. 1st, at 4.
Bristol Medical School—Oct. 1st.

MEDICAL EDUCATION IN IRELAND.

THE CAREER OF THE IRISH STUDENT.

The practice of the profession in Ireland, though not nearly as remunerative as in England, still affords a certain prospect to any medical man who is content with modest independence. Irish medical men pride themselves on holding a higher social position than the English general medical practitioner. They are entitled to meet the gentlemen of their locality on terms of equality, and it is not necessary or usual for them to endanger their prestige by the adoption of the trading or Christmas-bill system which obtains elsewhere. In fact, what they lose in income they gain in rank.

In order to put the career of the Irish student as plainly as possible, we narrate his progress from the day on which he takes his first step towards medicine to the hour of his issue from the cocoon of his studentship a fully-developed surgeon.

His parents and guardians have, after much discussion, decided that he shall be a doctor. He has had a moderate amount of schooling, at least the very moderate amount which is essential for the medical preliminary examination, and his father is ready to expend about £130 on his medical education, that sum being divided over four years, or paid down in order to secure the advantage of a considerable saving.

THE CHOICE OF UNIVERSITIES AND COLLEGES

Will depend on various circumstances, and on the aspirations of the student. If he is intended to make a fortune and enlighten his generation as a metropolitan practitioner, and if money and education are plenty, he will probably take Dublin University degrees in arts and in his profession. If the attainment of good professional rank on moderate terms be desired, the Licenses of the Colleges of Surgeons and of Physicians will serve every purpose. For any University degrees which are of any value, it is to be remembered the student must undertake the prolonged study of classics and science in addition to his medical, surgical, and anatomical studies; and he will have to pay a considerable sum for this course of teaching. But if he is content to face the expense and labour, he will enter the profession with all the prestige of an educated gentleman. In fact, the question whether he will or will not lay out for himself a University graduation in arts and medicine, depends principally on whether he has money and time to give to it, and whether or not he means to practise in the metropolis. The Queen's University places at the disposal of the student a cheap University degree, and thereby attracts many applicants, who are at liberty to write M.D. after their names, and are only called upon for a low curriculum, and a nominal residence in the Queen's College. This degree serves as a legal qualification to practise, and passes for an academic Doctorate in Medicine amongst the uninitiated; but it does not confer the prestige attached to the degrees of Oxford, Cambridge, or Dublin, and will not suffice, in this sense, for metropolitan consultation practice.

The Colleges of Surgeons and Physicians in Ireland confer qualifications which may stand well beside any in the United Kingdom, and as they make no pretence of academic training, and do not require either residence or anything more than a single arts examination, they continue to be licensing bodies for the rank and file of the profession in Ireland. If a student contemplates provincial practice—the army or navy—or a dispensary, he will most probably take the usual licences from the two Colleges. If he contemplates the lowly function of a country apothecary, he may take the licence of the Dublin Apothecaries' Hall, which is *in law* equivalent to a medical degree; or the licence of the Irish Pharmaceutical Society, which is now *the* qualification for pharmacy in Ireland, but does not confer the right to practise medicine. If he hopes, while practising as an Apothecary, to achieve a considerable private practice, he will find it necessary to obtain other collegiate medical and surgical degrees.

THE CHOICE OF SCHOOLS.

It must not be supposed that a student who intends taking a degree or diploma in any college need take his lectures in the school attached to that college, if there be one. On the contrary, with few exceptions, all certificates of attendance on lectures are interchangeable, and a student, no matter what medical school he may have studied in, will be admitted to any university or college. To this rule there is an exception. The Queen's University insists on certain courses being attended in one of the Queen's Colleges, by which means it enforces a brief residence in the Colleges.

There is in some cases a sort of semi-official connection between certain colleges and hospitals,—as between Trinity College and Sir Patrick Dun's, between the College of Surgeons and City of Dublin Hospital, and between the Catholic University and Mater Misericordiæ Hospital; but this connection only exists because the professors of the college are in many instances officers of the hospital, and it confers no special immunity or privilege on the student of such hospital.

The choice of a school, hospital, or college having been made, the tyro is perhaps sent to these to pass his

PRELIMINARY EXAMINATION

in general education, but if he is either lazy or ignorant, he may adjourn that unpleasant process, *de die in diem*, until the eve of his final qualification as a surgeon, when, if he does so, he will find himself in possession of a mental muddle of Latin and physic. The preliminary examination is, however, not to be feared.

We strenuously advise the parents of the student to insist on his passing his preliminary education before he enters a medical school or hospital, and thus the student will relieve his mind of the apprehension of a future examination, which he will assuredly put off to the last moment if he can. In England the four years of medical study required to pass do not commence to count until the preliminary is passed. It should be so in Ireland, but is not.

The preliminary examination (of the subject of which details will be found in the official regulations of each college) having been passed or postponed, he comes to town to do work.

He may do so either (1) on his own account, or (2) he may become voluntarily a pupil of some medical man, usually a teacher or hospital surgeon, who can assist him in his studential course. This is by no means a requirement of any of the colleges; it is purely a matter of option. Should the student pursue the first course he usually comes to town, takes a lodging close to his school and hospital, either by himself or in companionship with some *chum*, and either arranges to maintain himself or to board with his landlady. There is, of course, every degree of expense and comfort, but we should say that reasonable yet frugal living may be had in Dublin at about 10s. per week for lodging, and £5 to £6 per month for maintenance. He may also reside with a medical man, without entering upon any apprenticeship with or receiving any instruction from him. For his board and residence in such case the payment is from £7 7s. to £8 8s. a month.

COST OF EDUCATION.

Should the student proceed on his account, the lectures necessary for the L.R.C.S.I. will amount to £65; hospital attendance, according to the new scale of fees, £36; lying-in hospital from £4 4s. to £7 7s. These, with the diploma fee of £26 5s., represent the essentials. The sum of £50, paid down at the commencement is taken by the College of Surgeons as payment in full for all lectures requisite. The system of perpetual pupillage and discount off fees at hospitals has been abolished within the past month. Thus the absolute payment will amount to somewhere about £93, taking the minimum mode of payment. In addition to this sum are to be considered the payments for "grinding" or "coaching," as the Londoners call it, a process almost universal, but by no means necessary to any industriously inclined student. The fixed sum is at present, for private teaching, £15 15s. for the surgical and medical qualifications, and £5 5s. for pharmacy, &c. Should the candidate "grind" for the army and navy examinations, a fee varying from £10 10s. to £21 is, we believe, usual. Should the candidate perform operations on the subject as a practice, they will cost something extra. So that, assuming the extras or voluntary costs are incurred, the total will vary, say from £120 to £140 on a moderate scale; it is, of course, to be expected that pupil holders should have some extra payment; we therefore might name for them 160 guineas.

PAYMENT OF FEES.

If the student becomes an apprentice, he need not trouble himself about his payments. If he is his own manager, he must enter his name with the secretaries of the school and hospital, and pay for the lectures and hospital he intends to take out. If he is wise he will not adjourn the majority of his lectures, as he may, to the next year, but will take in his first year a full third of his curriculum. He is *supposed* to pay the professor's fee or hospital fee in full on entering his name, but few students do so; and many, we are sorry to say, are in the habit of entering for the minimum allowable number of lectures, and paying the minimum allowable proportion of the fee, putting off the attendance perhaps for ever, certainly until the last moment, and adjourning the payment until it becomes necessary to take up the certificates.

By a most objectionable laxity of system a student may get credit for one of his four years of attendance by paying a couple of guineas for dissections, and he may think himself safe in doing so if money be scarce; but if he does not pay his full third or fourth of the fees each year it often happens that he has to put off his examination from year to year—perhaps for ever—for want of the money to pay the accumulated fees of previous years.

The entry of names and commencement of study is supposed to date from the 1st of October in each year, but really does date from the 1st of November, and may be delayed by the dilatory until the 25th of the same month.

The student then begins work, attending hospital each morning at nine o'clock, and occupying his day from half-past eleven to five between lectures and dissections. His holidays—if the term be not ignoble—are a fortnight at Christmas, and a week at Easter, and he finally returns home at the end of July.

ATTENDANCE ON LECTURES.

The average Dublin student is supposed to attend of necessity, and irrespective of voluntary courses, twelve courses of lectures, six of them extending over six months, and six over three months, making a total of 52 months lecturing. In addition to this he is presumed to dissect and hear demonstrations, say an hour-and-a-half daily, for eighteen months, to attend hospital, for at least a couple of hours daily for twenty-seven months. To serve in the chemical laboratory for three months, and in the majority of cases, to attend the "grind" for at least eighteen months for two more daily hours. He cannot, if moderately industrious, get on with less than two hours reading per day, and he may have during the same period to work up his business for the "Preliminary," or his Arts Course in the University. This curriculum—taking the lectures on an average of four days weekly—represents nearly five thousand hours close work to be got through in three working years of about seven months (allowance being made for Christmas and Easter and summer holidays).

Thus it will appear that the student, to fulfil the nominal requirements of his education in Dublin, must work very nearly nine hours daily, *i.e.*, from after breakfast to about 7 p.m. It is hardly necessary for us to say that even the most avaricious medical bookworm does not attempt such a task. Necessarily the attendance on many of the courses of lectures is nominal in amount. The University of Dublin insists on an attendance of three-fourths of the number of the required lectures, but other Licensing bodies accept as "diligent" attendance the presence of the student at all—a few—or none of the lectures which the student pays for. It would be manifestly ridiculous for them to demand *bona fide* compliance with the regulations, and thus it happens that the student being hopeless of attending all—often attends—almost none of the lectures which are supposed to form the chief part of his education. The average student thinks himself exemplary if he works his hospital, dissections, demonstrations, physiology, lectures, and grind, and drops in occasionally to the other courses.

The progress of each year is the same, except that he usually devotes more attention to "grinding," dissection, and hospital dressorships, and less to lectures in his later years of study. At the end of his second year he will take his "first half" examination, and by so doing relieve himself, in a great measure, of the study of anatomy, and be in the position of devoting his third year to surgery and medicine. After the expiration of his third session, his student life, whether it begin in laziness and end in hurry and incompetency, or whether it commence in diligence and end in the confidence of proficiency, ends with the last examination, and he goes forth into the world either an ignoramus or a reliable surgeon, whichever his choice may have been.

PRIVATE TEACHING, OR "GRINDING."

THE classes for private instruction, or "grinding," as it is technically and generally called, are carried on in Dublin with universality and success.

As a rule, all private teachers are connected with schools of medicine, and being also hospital physicians or surgeons, can afford special advantages in the way of clinical instruction to their pupils.

Grinding is followed in two methods—namely, on what are commonly known as the "public" and the "private" plans. In the former, which is most usual, a number of gentlemen, varying in different schools from two to four, associate themselves into a firm, or co-partnership, and each man selecting particular branches, gives instruction to those only. For these classes a pupil may enter at any period of his course, by payment of a certain sum; but as the amount demanded generally is the same at whatever period of his course the student joins the class, and as he is taught for it until he obtains his degrees, it is usual to enter as early as possible, so as to secure the largest amount of instruction; but while there can be no objection to entering the name at the earliest period we strenuously advise the student not to devote himself to "the grind" for the first, or even for his second year of study, but to apply himself to his hospital and dissecting.

"Private grinding" is simply an arrangement quite independent of the other. A student who may, or may not, be a member of another class wishes for instruction; he goes to a "grinder," who for a sum of, usually, £3 3s. per month, instructs him in the required branches of his profession. As a rule, each teacher devotes himself to particular subjects: thus one gentleman grinds in, perhaps, Anatomy, Physiology,

Surgery, and Medicine, another in Surgery alone, whilst a third will teach Chemistry, Botany, and Materia Medica.

Each of these plans will be perceived to have its own particular advantage. By entering for public grinding, a pupil, on the payment of a moderate sum, secures that he shall be taught all his necessary subjects; while, on the other hand, if he enters for private grinding, he may, from being in a smaller class, secure a larger amount of individual attention; but does so at an increased expense, and must pay separately for the various branches of his teaching.

It does not require a very arithmetical head to see the difference between paying—say £15 15s.—for being taught for four years at least, in Anatomy, Physiology, Medicine, and Surgery, and paying £3 3s. per month for instruction in Anatomy and Physiology, and the same for Surgery or Medicine.

REGULATIONS AND BYE-LAWS OF LICENSING BODIES IN IRELAND.

UNIVERSITY OF DUBLIN.

(For Names of Professors and Examiners see Advertisement.)

THE Board of Trinity College, acting under the advice of their distinguished Medical Registrar, Professor Haughton, has steadily pursued a course which has raised the medical degrees of the University of Dublin to the highest rank—we might almost say—amongst the licensing authorities of the three kingdoms, and which merits the warm acknowledgments of all friends of priority of medical education.

REGULATIONS OF THE SCHOOL OF PHYSIC.

Matriculation.

Every student must be matriculated by the senior lecturer, for which a fee of five shillings is payable; but he need not attend any of the Arts Courses unless he desire to obtain a Licence or Degree in Medicine or Surgery. No student can be admitted for the Winter Courses after the 25th November.

QUALIFICATIONS FOR DEGREES AND LICENSES.

Bachelor in Medicine.

Candidates must be graduates in Arts, and may obtain the degrees at the same commencement as the B.A., or at any subsequent one. The Medical Education of a Bachelor in Medicine is of four years' duration, and comprises the following lectures :—

Winter Courses.—Anatomy and Physiology; Practical Anatomy; Surgery; Chemistry; Practice of Medicine; Midwifery; Practical Histology.

Summer Courses.—Botany; Materia Medica and Pharmacy; Institutes of Medicine; Medical Jurisprudence and Comparative Anatomy; Heat; Electricity, and Magnetism.

Hospital attendance on a Medico-Chirurgical Hospital during three courses of nine months each, with clinical lectures, including actual attendance on fever; six months' Practical Midwifery. Six months' Dissections and three months' Laboratory Instruction in Chemistry are required.

The Courses may be attended at any recognised Medical School.

The fee for the *Liceat ad Examinandum* is £5.

The fee for the degree of M.B. is £11.

Doctor in Medicine.

A Doctor in Medicine must be M.B, or qualified to take that degree, for three years. He must also read a Thesis before the Regius Professor of Physic.

Total fees for this degree, £13.

Bachelor in Surgery

Must be a B.A., and have spent four years in the study of Surgery and Anatomy. (a)

The Curriculum comprises the following, in addition to the Course for the M.B.:—

Theoretical and Operative Surgery ... One Course.
Dissection ... ... Two Courses.
Ophthalmic Surgery ... ... One Course.

Candidates are required to perform operations on the dead subject.

Candidates for the B.Ch. who have already passed the M.B. will be examined in Anatomy and Surgery only.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the degree of Bachelor in Surgery, £1.

Master in Surgery

Must be a B.Ch. for three years' standing, and must read a Thesis.

Fee for the degree of Master in Surgery, £11.

Master in Obstetric Science

(a Degree lately founded by order of the Board of T.C.D.).

A Master in Obstetric Science must have passed the M.B. and B.Ch. Examinations, and produce Certificates of having completed the following Curriculum :—

1. One Winter Course in Midwifery.
2. Six months' practice in a recognised Lying-in Hospital or Maternity.
3. A Summer Course in Obstetric Medicine and Surgery.
4. Two months' practice in the Cow-pock Institution.

Graduates in Medicine of M.D. standing may present themselves for examination without complying with Regulations 3 and 4.

Fee for the Degree of M.A.O., £5.

UNIVERSITY LICENCES.

Candidates for the Licences in Medicine or Surgery must be matriculated in Medicine, and must have completed *two years in Arts*.

Licentiate in Medicine.

The Course and Examination are the same as for the M.B.

An L.M., on proceeding to the degree of B.A., may become a B.M. on paying the fees without further examination.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the Licence in Medicine, £5.

Licentiate in Surgery.

The Course and Examination necessary for the Licence in Surgery is the same as for the degree of Bachelor in Surgery.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the Licence in Surgery, £5.

MEDICAL SCHOLARSHIPS.

Two Medical Scholarships are given annually, value £20 per annum each, tenable for two years, the examinations for which are held each year in June, in the following subjects :—Anatomy and Physiology, Chemistry, Materia Medica, Botany, Experimental Physics, and Comparative Anatomy.

Medical School Exhibitions.

The Professors of the University School give three Exhibitions annually, two senior, value £15 and £10, open to all students who have been three years attending the school, the subjects being—Practice of Medicine, Surgery, Pathology and Forensic Medicine; one junior, value £15, the time and subjects of examination being the same as those for the Medical Scholarship.

The Board of Trinity College have recently passed orders—1. That three-fourths of the lectures must be attended. 2. That a daily roll be called by each Professor.

Students entering for Demonstrations and Dissections are required to pay eight guineas before November 25; Dissections only five guineas; Demonstrations only three guineas; fourth year's Dissection two guineas.

(Full particulars as to the Educational Staff, Hours of Lectures, &c., in the School of Physic of the University will be found in our advertising columns.)

Official regulations may be obtained from the Rev. S. Haughton, F.T.C.D., Trinity College, Dublin.

(a) Students in the School of Physic before 22nd June, 1872, may obtain the M.Ch. according to the Regulations previously in force.

THE QUEEN'S UNIVERSITY IN IRELAND.
FACULTY OF MEDICINE.

DEGREE OF M.D. AND M.CH.

EACH candidate for the degree is required—

1. To have passed in one of the Queen's Colleges the examination for Matriculation in Arts. 2. To have attended in one of the Queen's Colleges lectures on one Continental language for six months, and on Natural Philosophy for six months; also two Medical Courses. For the remainder of the medical courses, certificates will be received from any recognised lecturer. 3. To pass three University Examinations.

The Medical Curriculum is divided into two periods of two years each.

The first period comprises attendance on Chemistry, Natural History, Anatomy, and Physiology, Practical Anatomy and Materia Medica, Practical Chemistry in a recognised laboratory, and six months of a medico-chirurgical hospital.

The second period comprises Anatomy and Physiology, Practical Anatomy, Surgery, Midwifery and Diseases of Women and Children, Medicine, Medical Jurisprudence, Practical Midwifery, and eighteen months' Hospital Practice.

At least two of the above courses of lectures must be attended in some one of the Queen's Colleges.

The University Examinations are held twice in each year, in June and September.

Each candidate for examination must forward to the Secretary, before the 1st of the month, notice of his intention to offer himself, along with his certificates.

THE FIRST UNIVERSITY EXAMINATION IN MEDICINE

comprises a modern language, Experimental Physics, Zoology, and Botany.

Students may present themselves at any time after the close of the first winter session. Before being admitted to examination each candidate must produce evidence of having completed the prescribed course.

THE SECOND UNIVERSITY EXAMINATION IN MEDICINE

comprises the following subjects:—Anatomy, Physiology, Materia Medica, and Chemistry, to which will be added Zoology and Botany in the examination of candidates who have not previously passed the first examination. Such candidates may either undergo their examination in Modern Languages and Experimental Physics as a part of the second examination, or at any time between the second and the degree examination.

Students may present themselves for the second examination at the termination of the first period of the curriculum, or at any subsequent period, but no student can postpone his second examination until he presents himself for his degree examination.

DEGREE EXAMINATIONS IN MEDICINE AND SURGERY, AND EXAMINATION FOR THE DIPLOMA IN MIDWIFERY.

The Examination for the M.D. comprises the subjects recommended for study during the second period.

The Examination for the M.Ch. comprises Surgery, including Operative and Clinical Surgery.

The Examination for the Diploma in Midwifery comprises the Theory and Practice of Midwifery, and the use of obstetrical instruments and appliances.

(*See Advertisements of Queen's Colleges, Belfast, Galway, and Cork.*)

Official regulations may be obtained from G. J. Stoney, Esq., Queen's University, Dublin Castle.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

(*For names of Professors in the College see Advertisement of the School of Surgery.*)

LETTERS TESTIMONIAL, OR THE L.R.C.S.I.

The examination is divided into two parts, known as the first and second halves.

The junior class must produce certificates of—

a, Preliminary examination, including Greek; *b*, three courses of lectures on anatomy and physiology; *c*, three on practical anatomy, with dissections; *d*, two on chemistry; *e*, one on materia medica; *f*, one on botany; and *g*, one on forensic medicine. This class is examined in anatomy, histology physiology, materia medica, and chemistry.

The senior class must produce certificates of—

a, Three courses on surgery; *b*, one on practice of medicine; and *c*, one on midwifery; also attendance on a recognised hospital for three winter and three summer sessions. This class is examined in surgery, operative surgery and appliances, practice of medicine, medical jurisprudence, and prescriptions.

The fees are: £5 5s. as registered pupil of the College; £5 5s. for the Junior Class Examination, which is not returned in case of rejection, but is allowed in the fee for his second examination; £15 15s. for the Senior Class Examination—total £26 15.

Pupils *who neglect registering themselves previous to going in for the preliminary examination*, must pay 10s. for that examination, to which, however, registered pupils, in addition to their other privileges, are free.

Every candidate rejected at the quarterly examination is required to pay to the College the sum of £2 2s. on applying for re-examination.

Method of Examination.—Candidates must lodge their fees and certificates one week before the day.

JUNIOR CLASS.—The candidates are examined in alphabetical order, and the examination occupies three days: 1st day, dissections; 2nd day, written examination on anatomy, physiology, histology, materia medica, and chemistry; 3rd day, *viva voce* examination on the same subjects. No candidate can proceed to the second day who has not passed the first; or to the third, who has not passed the second.

First Day, Dissection.—The hours of examination are from 10 to 12 a.m., 12 to 2, and 2 to 4 o'clock p.m. Each candidate first makes a dissection of a region allotted to him, half-an-hour, at least, being given him for this purpose. Then he is examined on the anatomy of that part, as well as upon that of those other regions which may have been dissected by other of the candidates. When the examination is over, the whole Court of Examiners assembles and adjudges the marks. The numbers of the candidates who have passed are posted in the hall of the College, and they are eligible to go in for the second day's written examination.

Second Day, Written Examination.—Four hours are devoted to the written examination: Two hours from 10 to 12 o'clock, a.m., to anatomy and histology; and two hours, from 2 to 4 o'clock, p.m., to physiology, materia medica, and chemistry. Eight questions in anatomy are printed and given to each candidate, an answer to four of them only being required. If any candidate has completed his paper before the end of the two hours, he may leave the hall upon handing his answers to the examiner. The examination in histology is part of the written examination. Two slides of different subjects are placed under two microscopes, and marked A.B. Five minutes are allowed to examine them; the student then goes to his place and writes his answer. Two similar slides are to be placed at the other end of the table, to be examined by the candidates in a similar manner. Each candidate separately inspects *either* set of slides. During the second two hours (2 to 4 o'clock) three questions in physiology, two in materia medica, and two in chemistry are given, the candidate's English and orthography being taken into account in adjudicating his marks.

Third Day, Viva Voce.—Two examiners attend each candidate for one quarter of an hour at four separate tables—viz.: three on anatomy and physiology, and one on materia medica and chemistry—one conducting the examination, and the other listening. Each examiner, at the conclusion of each examination, expresses his opinion of same by "marks," and hands the marks to the coun-

cillor presiding at such examination. When the examination is over, the whole court assembles and adjudicates upon the marks.

Senior Class.—The examination occupies four days: 1st day, written examination on surgery, practice of medicine, medical jurisprudence, and prescriptions; 2nd day, *viva voce* examination on surgery and practice of medicine; 3rd day, clinical examination; 4th day, operative surgery.

First Day.—Written Examinations occupy four hours, thus allotted: From 10 to 12 a.m., to surgery; the number of surgical questions shall be six. From 2 to 4 p.m., to practice of medicine, medical jurisprudence, and prescriptions. Two printed questions shall be given in practice of medicine, two in medical jurisprudence, and two in prescriptions.

Second Day.—The *viva voce* examination on surgery and practice of medicine is to be conducted similarly to that of the junior class.

Third Day.—At the clinical examination, two examiners are allotted to each batch of ten candidates. No candidate is to be examined in the hospital where he has been educated. The name of the hospital where each batch of candidates is to assemble for examination is to be posted in the hall of the College, immediately before the hour of meeting there. Each candidate takes notes of a case allotted to him, is questioned upon that or some other case, and is called upon to bandage or apply some surgical appliance.

Fourth Day.—Operative Surgery: The examinations in operative surgery shall be conducted by the four surgical examiners, who shall meet previously for the purpose of comparing their questions, which are written upon cards, to be deposited in a ballotting-box, from which each candidate, as called up, is required to draw his question, and to perform the operation there indicated. Each candidate is required to perform two operations. He is questioned upon these or other operations, and is examined as to his knowledge of surgical instruments and appliances.

No candidate can present himself for examination after the first day who has not satisfied his examiners upon the previous day; but all candidates who have passed any day's examination get credit for same. When presenting themselves upon a subsequent occasion, a former candidate is only required to present himself upon that portion of the examination in which he had failed.

Midwifery.—After passing the L.R.C.S., the student is admitted to examination for the diploma in Midwifery upon producing a certificate of one course on Midwifery and Diseases of Women and Children; a certificate that he has attended a lying-in hospital for six months; and a certificate that he has conducted thirty labour cases at least.

Candidates are examined on the Organisation of the Female, the Growth and Peculiarities of the Fœtus, the Practice of Midwifery, and the Diseases of Women and Children.

The candidate pays £1 6s. for the Midwifery diploma, provided he takes it out within one month from the date of his Letters Testimonial; after that date, £2 2s.

Official information may be had on application to Mr. J. Brennen, Royal College of Surgeons, Dublin.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

Regulations relative to the licence in medicine.

Examinations are held on the second Tuesday and Wednesday in each month, except August and September.

The name of every candidate, together with his schedule and the required documents, must first be submitted to the College on the first Friday in each month, and no name can be received later than the Monday previous.

Candidates who have not obtained some medical or surgical qualification must give proof of four years' study, of having passed a Preliminary Examination in Arts; and of having studied Anatomy and Physiology, Practical Anatomy, Chemistry, Practical Chemistry, Materia Medica, Botany, Medical Jurisprudence, Practice of Medicine, Pathology, Surgery, and Midwifery;

Of having attended a Medico-Chirurgical Hospital, with Clinical Lectures, for twenty-seven months.

Of six months' Practical Midwifery at a lying-in hospital, or other satisfactory evidence of having attended Practical Midwifery.

Testimonials of character from two registered physicians or surgeons are also required.

A candidate who has already obtained a medical or surgical qualification in Great Britain and Ireland, or who is a Graduate in Medicine of any foreign University recognised by the College, is required to produce his degree, diploma, or certificate of registration, a certificate of Practical Midwifery, and testimonials as to character.

The examination is conducted partly by written questions, partly *viva voce*, and divided into two parts:—

First Part—Anatomy, Physiology, Botany, and Chemistry.

Second Part—Materia Medica, Practice of Medicine, Medical Jurisprudence, and Midwifery.

For the Final Part, candidates are examined at the bedside in one of the Clinical Hospitals in Dublin.

Gentlemen who have passed the first portion of the examination of any University or of any of the Licensing Corporations of Great Britain and Ireland, and who have complied with the regulations of the College, are exempted from the first part of the examination.

Candidates who have been five years in practice are not required to undergo the written or clinical portions of the examination.

Regulations relative to the licence in midwifery.

Examinations for the Licence in Midwifery are held on the day after those for the Licence in Medicine, and are open to all Licentiates of the College without further qualifiation.

Candidates not being Licentiates of the College will be admitted on the following qualifications:—The Degree or Licence in Medicine or Surgery of any University or of any College in Great Britain or Ireland, with a Certificate of six months' Lectures on Midwifery, and of having attended Practical Midwifery for six months at a recognised lying-in hospital, or other evidence of having attended Practical Midwifery, together with testimonials as to character.

Fees for licences.

The Fee for the Licence in Medicine is £15 15s.

The Fee for the Midwifery Licence is £3 3s.

The Fee for the Licences in Medicine and in Midwifery, if taken out within one month, £16.

Further information will be found in our advertising columns, and blank schedules may be obtained by application personally, or by letter, to Dr, J. Magee Finny, the Registrar, College of Physicians, Kildare Street, Dublin.

THE APOTHECARIES' HALL, IRELAND.

The arts examinations

Will be held at the Hall four times in the year, viz., the third Thursday in the months of January, April, July, and October, at the hour of twelve o'clock noon.

The Examination for *the Licence* is divided into two parts:—

The First Part comprehends Chemistry, Botany, Anatomy, Physiology, Materia Medica, and Pharmacy.

The Second—Medicine, Surgery, Pathology, Therapeutics, Midwifery, Forensic Medicine, and Hygiene.

The professional examinations

Will be held *quarterly*, on the first and second Mondays in January, April, July, and October.

The First Part, on the first Monday, at twelve o'clock noon, and on the Tuesday and Wednesday succeeding at the same hour.

Subjects.—Chemistry and Botany, Monday; Anatomy and Physiology, Tuesday; Materia Medica and Pharmacy, Wednesday.

The Second Part, or Pass Examination, on the second Monday, at twelve o'clock noon, and on the Tuesday and Wednesday succeeding at the same hour.

Subjects.—Medicine and Surgery, Monday; Midwifery and Diseases of Women and Children, Tuesday; Forensic Medicine and Hygiene, Wednesday; Clinical Examination, Thursday.

The first two hours of each day will be devoted to writing answers, and after that, two hours to an oral and practical examination.

Candidates at the examination on Anatomy are liable to be called on to perform *dissections;* and at the examination on Surgery to perform one or more *operations* on the dead subject.

Doctors of Medicine and Licentiates of a College of Physicians or Surgeons who have also spent twelve months at *Practical* Pharmacy, may obtain the Licence by undergoing an examination—the former in Pharmacy and the latter in Medicine and Pharmacy. Licentiates of the London Society of Apothecaries are admitted *ad eundem.*

IRISH PHARMACEUTICAL SOCIETY.

THIS Corporation was created by Act of Parliament in 1875, and has just completed its second year of existence, its function being to license pharmaceutists and chemists in Ireland, hitherto solely qualified by the Apothecaries' Company. The regulations for the coming year will be as follows:—

PHARMACEUTICAL EXAMINATION.

Candidates must be twenty-one years of age, and have passed the prelim. at least one year previously, and must also have been practically engaged in compounding and dispensing for at least two years under the instruction of a pharmaceutical chemist or apothecary. Examinations on first Wednesday of January, April, July, and October.

Botany.—To recognise the principal indigenous plants used in medicine, to refer them to their natural orders, and to give the definitions and the distinctive characters of their several parts.

Materia Medica —Recognise specimens of the drugs of the Pharmacopœia, describe their characters and active principles, name sources from which obtained, and the officinal preparations into which they enter, and to detect adulterations.

General and Pharmaceutical Chemistry.—The elementary laws of chemistry and physics, including chemical equations. To recognise the chemical substances of the Pharmacopœia, to describe processes by which obtained; qualitative analysis, including the tests of the Pharmacopœia and volumetric analysis, and to submit to a practical examination in these subjects when required.

Practical Pharmacy.—To translate Latin prescriptions, to detect dangerous doses, to compound and dispense correctly. Explain the processes of making the non-chemical preparations of the Pharmacopœia, and to recognise them. Fee, £5 5s. In case of rejection, the sum of £2 2s. will be retained, and a candidate may not present himself for six months.

MEDICAL SCHOOLS AND HOSPITALS IN DUBLIN.

SINCE our last issue an important change has been made in hospital arrangements. The system of perpetual pupils, under which a student, binding himself to one hospital, received a discount off his fees, has been abolished, and he is free to go elsewhere as he pleases. Uniformity of fees has also been established, and the fee for all hospitals is now £8 8s. for winter (six months), £5 5s. for summer (three months), or £12 12s. for nine months. This arrangement, although involving an increase of fees, is very much to be approved of.

The Clinical Hospitals of Dublin are ten in number, exclusive of the Cork Street Fever Hospital, St. Mark's Ophthalmic Hospital, the Children's Hospital in Pitt Street, and other special institutions. To some of the Clinical Hospitals Medical Schools are attached; others, though they have no actual or official connection with any school, are in close affinity with certain teaching bodies, while others again are without any special connection with any school. While, however, such affiliation of a school and hospital may exist, it should be remembered that the Dublin schools and hospitals are open to all comers, and the student is competent to attend any hospital and any school he wishes.

The Names of the Professors, Lecturers, and Hospital Staff of the following Hospitals and Schools are not included in this column, being found in the advertisement of each institution.

SCHOOL OF PHYSIC AND SIR PATRICK DUN'S HOSPITAL.—The Medical School of Trinity College is one of the largest and most important. It is especially frequented by those students who intend to take the Arts Curriculum of the University, but is freely open to, and largely availed of by other students. It is under the immediate supervision of the Rev. Professor Haughton, the Medical Registrar of the University, and the names of its Professors will be found appended to the advertisement in our journal. Two Medical Scholars are elected annually by the Board of Trinity College, at an examination held at the end of June. Each scholarship is worth £20 per annum, and is tenable for two years. The Professors of the School of Physic give three exhibitions annually, amounting altogether in value to £40, subject to conditions prescribed by the Professors themselves.

Sir Patrick Dun's is the hospital attached by Act of Parliament to the School of Physic, and officered by the Professors of that school. It was for many years a purely medical hospital, but is now a large medico-chirurgical hospital, with a Midwifery Maternity attached.

The ROYAL COLLEGE OF SURGEONS' SCHOOL is situated within the walls of the College, and is under the superintendence of the Council, who appoint the Professors. The Professor of Physiology commences his course with a series of twelve lectures on Comparative Anatomy—free to the public. The dissecting-rooms have been recently much enlarged. Prizes in Anatomy and Physiology, and Surgery will be awarded at the end of the Winter Session. Junior Exhibition of £15, a Senior Exhibition of £25, and Honorary Certificates will be awarded at the end of the Winter Session.

The CITY OF DUBLIN HOSPITAL has been hitherto more closely connected with the College School than any other hospital. It is situated in Upper Baggot Street, about ten minutes' walk from the Royal College of Surgeons. The hospital contains 130 beds, and accommodates about 1,300 intern patients annually. There are special wards for ophthalmic and aural diseases (on which subjects a special coarse of lectures is delivered), and for diseases of children. A new wing has been lately opened for the reception of fever and other infectious diseases. The "Purser" Studentship of £30 per annum (with apartments) is obtainable by competitive examination by all students; numerous prizes and medals are given, and special certificates are granted.

The CATHOLIC UNIVERSITY SCHOOL is situated in Cecilia Street, about ten minutes' walk from the University itself in St. Stephen's Green. Most of its Professors are physicians and surgeons of the Mater Misericordiæ, St. Vincent's, or Jervis Street Hospitals, and its courses of study qualify for admission to all the licensing bodies. The University itself does not grant degrees in medicine or surgery, being as yet unchartered, but the School is instrumental in the education of a large proportion of the Catholic students of Ireland. The University grants an exhibition of £20, a gold medal, value £7, and class prizes. There is no residence for students.

The hospitals most closely connected with this School are St. Vincent's, in St. Stephen's Green; the Mater Misericordiæ Hospital, in Eccles Street; Jervis Street Hospital; and House of Industry Hospital.

ST. VINCENT'S HOSPITAL was established in 1834 by the Sisters of Charity, some of whom had studied the system of the Parisian hospitals, after which it was modelled.

The ward for "*Enfans Malades*" is an interesting feature. The hospital has over 100 beds constantly full, and each sister has charge of about twelve patients. In connection with it is the Convalescent Home at Lindon Grove, Blackrock. The clinical instruction in medicine and surgery is given by Dr. Quinlan, Dr. Mapother, Dr. O'Leary, and Dr. Cryan.

A Special Ward for the treatment of the Diseases of Women has been opened under the care of Dr. J. A. Byrne, Gynæcologist to the Hospital.

The MATER MISERICORDIÆ HOSPITAL is the largest of the Dublin Hospitals, and is intended to be much extended. It is situated at the northern side of the town. The new wing is specially reserved for the admission of cases of fever and other contagious diseases. A special course on these subjects is given.

There are four resident pupils appointed every six months. Good lodgings can be had very cheap close to the hospital. Prizes to the value of £30 are awarded at the end of the winter session for the best reports on the cases under treatment in the hospital.

JERVIS STREET HOSPITAL is one of the oldest established charitable institutions in Dublin, having been founded in 1721. It is situated in a part of the city not otherwise provided with hospital relief, and which, from its commercial character, supplies the hospital with an abundance of surgical cases. Like St. Vincent's Hospital, its nursing arrangements are under the charge of a community of Sisters of Charity. The hospital, being found inadequate to the demands upon it, is in process of being rebuilt.

The LEDWICH SCHOOL was founded in 1810 by the well-known Dr. Kirby, and since then has fully sustained its prestige under the management of the Messrs. Ledwich and Mason. Its name was bestowed upon the school as a tribute of respect to the late F. H. Ledwich, who sacrificed a life in an increasing effort to promote its welfare. It is situated in Peter Street, not five minutes' walk from the College of Surgeons, the Meath, Vincent's, and Mercer's Hospitals, and in the same street with the Adelaide Hospital and the Coombe Lying-in Hospital, and ten minutes' from the Catholic University School, the School of Physic, and the City of Dublin Hospital. No Introductory Lecture will be given at this school.

MERCER'S HOSPITAL, founded A.D. 1750, William Street. —This hospital is situated in the centre of the metropolis, in the midst of a densely-crowded population, and its doors are open at all hours for the reception of accidents and of acute cases. Dispensaries are held daily, and are largely attended. Special instruction is given in cutaneous and infantile diseases. From the large number of accidents which from its position come to the hospital, students are afforded ample opportunities of rendering themselves familiar with the nature and treatment of disease in its various forms, and of acquiring dexterity in the dressing and manual operations of minor Surgery.

RICHMOND, WHITWORTH, and HARDWICKE HOSPITALS.—Accommodation: Hardwicke Hospital, 120 beds; Whitworth Hospital, 82 beds; Richmond Hospital, 110 beds; total, 312 beds.

The hospitals are visited each morning at 9 o'clock by the physicians and surgeons, and, in addition to the usual bedside instruction, Clinical Lectures are delivered on the most important cases. Special instruction is also given on various branches of Medicine and Surgery.

The Truss Establishment, for the distribution of trusses to the ruptured poor of Ireland, is connected with these hospitals. There is a very large ophthalmic, aural, and dental dispensary, and the respective surgeons give instruction in these important subjects.

Eight resident Clinical Clerks and the dressers are appointed each half-year, and provided with furnished apartments, fuel, &c., &c. These appointments are open not only to advanced students as formerly, but also to those who are qualified in medicine or surgery. A House-Surgeon for the Richmond Hospital is elected biennially, and receives a salary.

The RICHMOND LUNATIC ASYLUM, containing 1,000 beds, adjoins these hospitals.

The CARMICHAEL SCHOOL is situated in North Brunswick Street.

The various lectures are now delivered, and the dissections carried on in the new building, which the munificence of the late Surgeon Carmichael has given to the proprietors.

The close proximity of this school to several of the Dublin clinical institutions, and its intimate connection through its teachers with the Richmond, Whitworth, and Hardwicke Hospitals, ensures equal opportunities to the pupils of becoming thoroughly acquainted with the more immediately practical part of their profession.

Arrangements have now been completed for rendering more available the Carmichael premium bequest, which enables the proprietors to distribute prizes to the amount of £68 yearly; and the Scholarship, value £15 yearly, which the friends of the late Dr. Mayne founded in his name, is allotted at the termination of the session.

DR. STEEVEN'S HOSPITAL AND SCHOOL are situated close to the Kingsbridge Terminus of the Great Southern and Western Railway, and therefore occupy a position of their own, far removed from the other medical institutions.

Immediately adjoining is St. Patrick's (Swift's) Asylum for the Insane.

There is accommodation for residence of seven surgical and four medical residents; besides whom the resident-surgeon receives house pupils. The fees payable for the privilege of residence are twenty-one guineas, winter; fifteen guineas summer six months. Students have apartments, coal, gas, and furniture.

Accommodation outside the hospital, in the neighbourhood, is arranged by the hospital authorities.

The office of Clinical Registrar, salary £40, is reserved for students of the hospital.

The examination for two Midwifery Assistants is held on the last Saturday in November. Salary £30.

Candidates must be in at least their second year, have atttended Practical Midwifery in the Maternity Department, and be entered on the books of the school.

Gold medals will be awarded in each year's class.

As we have said, certain hospitals have no special affinity with any college or school. Of these are the Meath and Adelaide Hospitals.

The MEATH HOSPITAL, which is also the public infirmary of the county of Dublin, containing 120 beds, and now in the 127th year of its existence, ranks among the oldest of the charitable institutions of this city. It is situated on the southern side of the city, upon about three acres of ground, formerly called "The Dean's Vineyard." The original Meath Hospital, situated on the Coombe, was opened in 1753. The foundation-stone of a new Meath Hospital, on the Coombe (now the Coombe Lying-in Hospital), was laid out by Lord Brabazon, 10th October, 1770; this hospital was, in 1774, constituted the County Dublin Infirmary by Act of Parliament. The present building, in Heytesbury Street, was opened in 1822, since which time the building has undergone considerable enlargements and improvements. In 1830 the theatre for operations and lectures was erected. In 1852-3 the Collis Wards were added as a memorial to Maurice Collis, twenty-five years surgeon to the hospital. In 1865 the "Smyly Ward," built for the special accommodation of children, was opened by the Lord-Lieutenant, Lord Wodehouse.

The ADELAIDE HOSPITAL is in Peter Street, next door to the Ledwich School, and within a few minutes' walk of the College of Surgeons and the Universities. From the 1st of October the physicians and surgeons will visit the wards, and give instruction at the bedside, at the advertised hours.

There is a detached fever ward and wards for infants and children. Special hours are devoted to clinical instruction in the Diseases Peculiar to Women, and students are individually instructed in the use of the Stethoscope, Ophthalmoscope, Laryngoscope, and Microscope. Two resident pupils are selected half-yearly. Prize examinations are held at the termination of the Session. The large dispensaries afford facilities for the study of minor Surgery.

SPECIAL HOSPITALS.

The Special Hospitals of Dublin are the Rotunda and Coombe Lying-in Hospitals, the Westmoreland Lock Hospital, Cork Street Fever Hospital, Pitt Street Children's Infirmary, St. Mark's Ophthalmic Hospital, two Orthopædic Hospitals, and the National Eye and Ear Infirmary.

COOMBE HOSPITAL.—This hospital has been rebuilt and refurnished, and has sixty-five beds, was founded in 1826, but it was not till 1867 that it was incorporated by Royal Charter, which enables its medical officers to issue diplomas qualifying the holders to practise midwifery. This hospital is situated in the centre of a district densely populated by

the lower orders, and thus affords the amplest opportunities for practice. It accommodates about 600 labour cases within its walls, while those attended as externs amount to nearly double that number. Moreover, the chronic ward for the reception of cases of the diseases of females gives admission to about 80 patients annually. The fee for attendance is £8 8s. for six months as extern, and £18 18s. as intern pupil. During that period the student attends on a given night in each week, or oftener, if circumstances permit, and takes charge in his turn of any cases that may be admitted to the labour wards, or may call for his assistance outside. An annual examination is held in May and November, at which prizes of considerable amount are awarded, and certificates of good answering granted. Two paid resident pupil midwifery assistantships, and a paid clinical clerkship under the obstetric surgeon, are obtainable annually by competitive examination, for which all pupils who have obtained their midwifery diploma are eligible.

The Pitt Street Children's Infirmary, established 1821, is situated close to Mercer's Hospital and the College of Surgeons. It was founded to provide treatment specially for children, and to teach that special branch of disease. Dr. Moore and Dr. Churchill are the medical officers.

St. Mark's Ophthalmic Hospital and Dispensary for Diseases of the Eye and Ear.—This is the oldest and largest special ophthalmic hospital in Dublin, and was founded by Sir William Wilde. Instruction is given on the mornings of Mondays, Tuesdays, Thursdays, and Fridays, from 11 to 1 o'clock, and operations are performed on Wednesdays and Saturdays from 11 to 1 o'clock. A surgeon resides in the institution, and receives a salary of £80, besides rooms, gas, coal, &c.

The Rotunda Hospital.—The well-known and time-honoured institution possesses a character as a School of Midwifery which needs no comment. It is not, however, as generally recognised as it deserves to be, as also a great school of gynæcology. The institution consists, in fact, of two distinct hospitals — viz., the lying-in hospital, into which some 1,200 cases of labour are admitted annually, and the Hospital for the Treatment of Diseases peculiar to Women, in which some 500 patients are now annually admitted during the course of the year. The present master, Dr. Lombe Atthill, as is well known, devotes special attention to this department of the charity. There is every facility for the study of the special departments of medicine to which the hospital is devoted, and both students and midwives are granted a diploma on passing an examination.

The Clinical Clerkship, value £30 a-year, tenable for six months, is adjudged, after open competitive examination, to any pupil who has attended the full course of instruction in the hospital, but who has not obtained a registerable qualification.

Cork Street Hospital is the only special fever hospital in Dnblin, contains 120 beds, and is mainly supported by Government. One or more medical pupils are elected by the Governors for a six months' residence, for which a special certificate is given. Extern Students are also admitted for the same term. Fee, three guineas. Further particulars of Dr. Atkins, Registrar.

National Orthopædic Hospital of Ireland for the treatment of Club-foot, Contractions and Distortions of the Limbs, Spinal and all other Bodily Deformities, 7 Upper Kevin Street, Dublin.—Mr. Ormsby attends daily from 11 to 12 o'clock, and gives Clinical instruction on the intern cases.

The hospital is capable of containing 25 beds, for the reception of severe cases of deformity. There is a large dispensary for extern patients held on Tuesday, Friday, and Saturday, 11 to 12. Operations performed on Fridays. Students and practitioners are allowed to attend the Clinical instruction.

Dublin Orthopædic Hospital, 11 Usher's Island, contains 20 beds for the treatment of deformities. It is under the surgical management of Messrs. Swan and Bookey, of Steeven's Hospital. Six beds are free.

The Dental Hospital of Dublin.—This is the only hospital in Dublin solely devoted to the treatment of Diseases of the Teeth and Deformities of the Mouth, which will afford gratuitous relief to the suffering poor. It is open daily from 9 to 10 a.m.

Cork Ophthalmic and Aural Hospital has a special throat department, and is the only special institution of the sort in the south of Ireland, and is under the care of Dr. H. Macnaughton Jones. It contains twenty-six beds, and an average exterior attendance of 1,700 patients. A Resident Pupil is chosen every three months.

INTRODUCTORY LECTURES IN THE DUBLIN SCHOOLS AND HOSPITALS.

School of Physic—None.
Royal College of Surgeons—Dr. Cameron, Oct. 29.
Catholic University—Prof. Byrne, Nov. 2, 3 p.m.
Dr. Steevens' Hospital and School—None.
Meath Hospital—Dr. Foot, Nov. 5, 10 a.m.
City of Dublin Hospital—None.
Sir Patrick Dun's Hospital—None.
Mercer's Hospital—None.
Richmond Hospital—Dr. Lyons, Nov. 1, 10.30 a.m.
Mater Misericordiæ Hospital—Not fixed.

Other Hospitals and Schools not fixed.

THE QUEEN'S COLLEGES.

These three important institutions are the special schools of the Queen's University, and are situated in Belfast, Galway, and Cork. They receive a large subvention from the public funds, and are provided with every facility for the education of their students. It is essential that every candidate for the medical or surgical degrees of the Queen's University shall have attended courses of lectures in Modern Languages, Natural Philosophy, and at least two medical subjects, in one of the provincial colleges, so that attendance at a Queen's College during one of the years of medical study is compulsory upon all candidates for the licences of this University.

A detail of the prizes and exhibitions in arts and medicine, the names of the professors, and other information, *will be found in the Advertisements* of this issue, and full details may be had on application to—

Belfast.—Rev. Richard Oulton, B.D., Registrar.
Cork.—Alexander Jack, M.A.
Galway.—Arthur Hill Curtis, M.A., LL.D.

RELATIVE COST OF MEDICAL EDUCATION IN IRELAND.

(*Exclusive of private teaching.*)

University of Dublin M.B. and M.Ch.—1. Lectures, £55 15s.; 2. Hospitals, £43 1s.; 3. Degrees, £26—£124 16s.; expense of Degree in Arts, £83 4s. Total, £208.

Queen's University M.D. and M.Ch. (all lectures being taken in the provincial colleges.)—£62 9s.; ditto (two years' lectures and hospital taken in Dublin) say, £85.

Royal College of Surgeons and King and Queen's College of Physicians L.R.C.S.I. and L.K.Q.C.P.I., £138 7s.

Apothecaries' Hall, L.A.H., £59.

TECHNICAL EDUCATION IN IRELAND.

THE ROYAL COLLEGE OF SCIENCE.

The educational staff of this institution consists of eight professors, one demonstrator, and two laboratory assistant. It supplies, as far as practicable, a complete course of instruction in science, applicable to the industrial arts, especially those which may be classed broadly under the heads of mining, engineering, and manufactures.

The course of instruction extends over three years, each year being divided into two terms. In the first two years the instruction is general. In the last year it is specialised under the heads of mining, engineering, and manufactures.

There are four royal scholarships, of £50 yearly each, with free education, tenable for two years; two will become vacant each year. They will be given to students who shall have been a year in the College.

There are also nine royal exhibitions attached to the College, of £50 each, tenable for three years.

The session commences on the first Monday in October, and lasts until 21st June following.

The fees payable are £2 for each separate course of lectures.

For further particulars see Advertisement, or apply to F. Sidney, Esq., LL.D., Royal College of Science, Dublin.

MEDICAL EDUCATION IN SCOTLAND.

Important changes have taken place during the past year in the teaching department of the Scotch Schools, prominent among these the retirement of the venerable and accomplished professor of physiology, at the University of Glasgow, the retirement of Professor Christison, of Professor Ogilvie, of Aberdeen, and the transfer of Mr. Lister and Dr. Mathews Duncan to London. The chairs of the two first are already filled by men who promise well to maintain the fame of their predecessors, and thus sustain the reputation of the respective schools to which they are attached. The latter chairs are still vacant, but it is believed that both will soon be filled by Edinburgh candidates.

Subjoined is a list of the Scotch Schools and Examining Boards, with other relative information.

THE UNIVERSITIES.

The fees for the degrees in all four of the Scotch Universisies are the same—viz., M.B., £15 15s. (£5 5s. being payable at each of the three examinations); C.M., £5 5s. (in addition to the fees of M.B.); M.D., £5 5s. (in addition to the fees for M.B.); and £10 for Government stamp.

University of Edinburgh.—This is a qualifying and teaching body, and has complete Faculties also of Theology and Law equally with Medicine. Prior to commencing medical studies the student must pass a preliminary examination in English, Latin, and Arithmetic, the elements of mathematics, and the elements of mechanics. An examination in at least two of the following subjects is demanded before being admitted to a professional examination, in addition to the foregoing subjects—viz., Greek, French, German, Higher Mathematics, Natural Philosophy, Logic, Moral Philosophy. The University confers three degrees—medical and surgical qualifications being granted—M.D., M.B., and C.M. The C.M is not conferred unless the M.B. be taken at the same time. For the degrees of M.B. and C.M. four years of professional study must be completed after passing a preliminary education recognised by the Medical Council. A degree in Arts of any British University is held to supersede the preliminary examination. Of the four years of professional study, one must be passed in the University of Edinburgh, and another of such four years must be in some other University entitled to grant the degree of M.D. The M.D. degree is conferred on Bachelors of Medicine who have attained the age of twenty-fours years, and who present a thesis to be approved by the Medical Faculty. The lectures of several extramural lecturers in Edinburgh, as well as those at the London medical schools, and such teachers in the provincial schools approved by the University Court, are recognised, subject to certain conditions.

University of St. Andrews.—This University confers the degree of M.D. (certain exemptions being made to ten practitioners yearly), M.B., and C.M. Two years of study of each candidate must be in one or more of the following Universities—viz., the Universities of St Andrews, Glasgow, Aberdeen, Edinburgh, Oxford, and Cambridge; Trinity College, Dublin; Queen's College, Belfast; Queen's College, Cork; and Queen's College, Galway.

University of Aberdeen.—This University is entitled to confer degrees in all the Faculties, and is a teaching body as well. The fees for graduation and the curriculum of study are nearly the same as in the University of Edinburgh. One year must be passed at Aberdeen. Besides the Royal Infirmary, students have the opportunity of attending several other local institutions. Professor Brazier, Secretary to the Medical Faculty, should be addressed for further information.

University of Glasgow.—This is both a teaching and examining body. It confers three degrees, viz.: Bachelor of Medicine, Master of Surgery, and Doctor of Medicine. Before graduating the student must have been engaged in medical study for four years, one of which must have been spent at the University of Glasgow, and the others at some university or school recognised by the Glasgow University. A *medicus annus* is constituted by two courses of 100 lectures each, or by one course of 100 lectures, and two of 50 each. Two preliminary examinations must be passed, one before commencing study and the other before appearing at the first professional examination. A degree in Arts (not honorary) exempts the student from these examinations. The hospital practice is attended chiefly at the Western Infirmary, to which several of the professors are physicians and surgeons. Numerous other medical institutions exist in the city: and the fact that hospital appointments in this city are virtually life-ones, causes a reasonable and justifiable increase in their number from time to time. The University recognise several extramural lecturers.

THE COLLEGES.

Royal College of Physicians of Edinburgh.—This, like the Sister College of London, is exclusively a qualifying body. In conjunction with the Royal College of Surgeons of Edinburgh, and the Faculty of Physicians and Surgeons of Edinburgh, this College grants a double qualification, and registerable as such. Each applicant for professional examination must previously have passed the preliminary examination prescribed by the General Medical Council. Exemption is made in the case of Masters or Bachelors of Arts of any British University and certain recognised foreign Universities. Candidates who may have already passed the first professional examination of any body approved of by the College will be at once admitted to the second part of the examination.

The Fellowship is conferred only by election, and the candidate must at least have been a member of the College for one year previously, and have attained the age of twenty-five years.

The Membership is conferred on Licentiates of the College, or Graduates of a British or Irish University, with whose knowledge the College may be satisfied, and who has attained the age of twenty-four years.

The Licence.—The regulations are nearly the same as those for the joint examination for the Scotch double qualification.

Qualification in Public Health.—The College now confers a certifieate of competency in Public Health. The examinations are held in April and October. Fee, £10 10s.

Fees.—The fee payable by a Licentiate is £10 10s. In the case of unsuccessful candidates the fee is returned, minus £2 2s., retained to defray the expenses of examination.

Royal College of Surgeons, Edinburgh.—Candidates for the diploma of this College must have followed a course of study in some University, or in an established school of medicine, or in a recognised provincial school. Candidates already qualified are admitted on certain exceptional conditions.

Preliminary Examination.—All candidates for the diploma of the College must have passed the complete examination prescribed by the General Medical Council, and have their names inscribed on the register of medical students at the commencement of their medical studies. The preliminary examination of certain recognised bodies is accepted by the College.

Professional Education.—Candidates commencing professional study must have been engaged, during four years after the preliminary general education, in professional study, which shall include not less than four winter sessions, or three winter and two summer sessions' attendance at a recognised medical school.

Professional Examination.—The professional examination is divided into two, the one oral, the other written.

The first examination embraces Anatomy, Physiology, and Chemistry. The second examination embraces Surgery and Surgical Anatomy; also Medicine, Midwifery, Materia Medica, and Medical Jurisprudence; and does not take place prior to the termination of the winter session of the last year of study.

The Fellowship is conferred only on candidates who have obtained a diploma from this College or from either of the Colleges of Surgeons of England or Ireland, or the Faculty of Physicians or Surgeons of Glasgow, and who are twenty-five years of age. The election is by ballot, and three-fourths of the votes are required to be in the candidate's favour, and he has to subscribe certain bye-laws of the College. Fellows are forbidden to keep open shops, to be connected with secret remedies, or indelicate advertisements or publications.

The License.—The regulations are almost the same as those for the joint examinations conducted by the Colleges of Physicians and Surgeons.

THE SCOTCH DOUBLE QUALIFICATION.

The Royal College of Physicians of Edinburgh, by a certain arrangement, grants conjointly with the Royal College of Surgeons of Edinburgh, and the Faculty of Physicians and Surgeons, after one series of examinations, a double qualification, two diplomas being given and registerable under the Medical Act as medical and surgical qualifications, thus: Lic. Roy. Coll. of Phys. Edin. and Lic. R.C.S. Edin., or Lic. Roy. Coll, of Phys. Edin. and Lic. Fac. Phys. and Surg. Glas., according as the case may be.

By the understanding subsisting between these bodies, the College of Physicians take exclusive charge of the examination in medicine; and the College of Surgeons or the Glasgow Faculty, of that in surgery; while departments common to both medicine and surgery are examined by a board in which each body is represented. Such arrangements as these were contemplated by the Medical Act, and authorised by Section XIX., and those under consideration were sanctioned by the Medical Council, 7th August, 1859.

Candidates having fulfilled the full curriculum are subjected to two professional examinations. Hereafter the preliminary examination must be passed before commencing professional study, and must be otherwise conformable to the regulations of the Medical Council.

School of Medicine, Edinburgh.—The lectures of this School qualify for the University of Edinburgh and the other Universities, and the Royal Colleges of Physicians and Surgeons, Edinburgh, London, and Dublin, and the other medical and surgical boards.

In accordance with the statutes of the University of Edinburgh, any four of the medical classes required for graduation, or two complete *anni medici*, may be studied at this school, each of which may be constituted by attendance on two of the six-months' courses, or on one of these, and two three-months' courses. It is always provided, however, that the fee for any class taken for graduation in the University of Edinburgh shall be the same as that charged by the University for the corresponding class.

The whole of the education required for graduation at the University of London may be taken at this school. The minimum cost of the education of this School of Medicine for the double qualification of Physician and Surgeon from the Royal Colleges of Physicians and Surgeons, including the fees for the joint examination, is £90 4s., which is payable by yearly instalments during the period of study; and the minimum cost for the single qualification of either Physician or Surgeon, including fees for examination, is £80.

Royal Infirmary, Edinburgh.—Clinical instruction is afforded at this institution under the supervision of Professors of the University and ordinary physicians and surgeons to the Infirmary. Special instruction is given on diseases of women, physical diagnosis, and diseases of the eye. Separate wards are devoted to fever, venereal diseases, diseases of women, diseases of the eye, &c. The perpetual fee, in one payment, is £10; the annual fee, £5 5s.; half-yearly, £3 3s.; quaterly, £1 11s. 6d. Separate payments for two years entitle the student to a perpetual ticket. No fees are payable for any surgical or medical appointment.

Glasgow Royal Infirmary School of Medicine.—A full medical curriculum may be attended at this newly-instituted school. The Winter Session opens on Tuesday, the 30th October. The fees for each class are: for first course, £2 2s.; second and perpetual, £1 1s.; and students who have attended a first course elsewhere will be admitted to the second course on the same terms as if they had commenced their studies at this school. The fees for Anatomy are, including lectures and demonstrations, and practical anatomy, first Winter Session, £4 4s.; Summer Session, £1 1s.; second Winter, £4 4s.; afterwards £1 1s. for session.

Anderson's University, Glasgow.—This is exclusively a teaching body. In addition to its offering excellent opportunities for acquiring a good medical education, instruction is given in the other branches of a liberal education, advantage of which might profitably be taken by medical students generally. The expenses of this institution, as already mentioned, are exceedingly moderate. Extensive opportunities for dissection are offered, under the guidance of the very talented lecturer on anatomy.

Students are admitted to the practice of the Western Infirmary, close to the University, which has about 200 beds, and an excellent staff. Clinical lectures are delivered by the professors at this institution, and at the Royal Infirmary, students having the option of choosing any two whose lectures he will attend.

In connection with this College, there are five hospitals and dispensaries for special diseases, to all of which students are admitted.

DATES AND HOURS OF THE INTRODUCTORY LECTURES AT THE SCOTCH MEDICAL SCHOOLS.

University of Edinburgh—October 30, 2 p.m.—The Principal.
University of Glasgow—None. Session commences Oct. 30.
University of Aberdeen—None. Session commences Oct. 31.
School of Medicine, Edinburgh—Oct. 30, 11 a.m.—Dr. John Duncan.
Anderson's University (Glasgow)—None. Session commences Oct. 30.
Glasgow Royal Infirmary School of Medicine—Session commences Oct. 30.

THE HARVEIAN ORATION—1877.

DELIVERED BEFORE

THE ROYAL COLLEGE OF PHYSICIANS.

By Edward H. Sieveking, M.D., F.R.C.P.,

Physician-Extraordinary to the Queen; Physician-in Ordinary to the Prince of Wales; Physician to St. Mary's and the Lock Hospitals, &c.

In no department of medical science has careful study offered to the inquirer of late years more promise of reward than in the domain of the nervous system. We have, indeed, been told, but recently in this hall, by one of its most successful cultivators, how much of uncertainty yet surrounds our knowledge of disease of the brain; and yet, whether we dwell upon the physiology of the cerebro-spinal system, the chemical changes which it controls, the localisation of function, the relation of nutrition and nerve-force, or the minute pathology of the brain and spinal cord, it is impossible not to be struck by the progress made by labourers of the present and most recent periods. In this field alone, of all the wide regions of medical science, we find no evidence that our Harvey instituted any special inquiries and observations. In his manuscript lectures on anatomy, the brain and spinal cord are treated in the most summary manner; and although his works afford proofs of his pathological knowledge, of his acquirements and practice in surgery, and of his acquaintance with and performance of operations in obstetrics, we search in vain for a sign that he even appreciated the importance of the nervous system. The significance of this part of our fabric has, indeed, been scarcely recognised until the present century; and even now, great as have been the achievements of illustrious students, many of whom we claim as associates of this College, we only appear to see the dawn of the full effulgence of knowledge. Truly, whether we look to the results already secured, or to the promise they offer of greater light, we cannot refuse the claim of the labourers in this department of medical science to be considered as genuine fellow-labourers of Harvey; conscientiousness, perseverance, concentration and clearness of thought, are the characteristics of many of our contemporaries, whom, in an assembly like the present, it would be unnecessary to recall by name. But they, like the collaborators in other realms of medicine, have materially contributed towards rendering this present time deserving of the title of the Harveian era.
